IN A motion picture comedy, shown recently, an automobile speeder is being chased by two officers on motor cycles. The man in the car outdistances his pursuers, and comes to a fork in the road. One road has a sign across it reading "Repairs Being Made—Road Closed." The man drives his car into the open road, gets out, takes the sign from the other road and places it across the one down which he is going, and drives on. When the officers arrive they go down the road that is being repaired with such speed that their machines are wrecked, while the man in the first car escapes.

All along the highway of life will be found forks in the road. They are numerous and confusing. It is difficult to decide which one to take to make our destination in safety. There are many signs at the forks in the road, telling which way to go, but we never can be sure but that some one has changed them.

The young man or woman who comes to the fork in the road where a decision must be made regarding a career, is apt to be misled. The guideboard may read "This Way to Prosperity" and the road toward which it points may look an easy one to travel. Don't decide which road to take until you have found out whether the hand points the right way.

There are forks in the road where one way leads to happiness, and the other to despair. If the hand points toward the smooth, glistening white road which beckons you, beware! Perhaps some one has changed the signboard to lure you to ruin, for the road that leads to despair, at the fork, is paved with blocks of gold, whose radiance dazzles the eyes of those who look upon it.

No man or woman can go far on the highway of life without coming to the parting of the ways. All along the way are forks in the road, and the decision has to be made which one to take. The guideposts are many, some truthful and pointing aright, while others are false, and if you follow their advice will lead to calamity, despair and death.

Pause, whenever you come to a fork in the road, and be sure that you are on the right path before you go on.

Mr. Ford's Page

WE ARE on the very threshold of a new age. The dates are unimportant, for in the advance of the plan of the ages it is not the sharp-cut dates, but periods of time, that are important. Old things pass away in a fading-out process; new things gradually dawn. Only on looking backward do the people usually realize that "a great thing took place back there." Surprisingly few of the real turning points of the world come amid signs and wonders and people standing in awe of what is passing. In the minds of most, the War was *the* cataclysm, because it was noisy; but something greater than the War, though much less clamorous, is in passage now.

It is neither for man to help or hinder, but hold himself ready to do what is right, whatever may be the circumstances. When the age begins to turn, we are too late to stop it, for the causes thereof were set in motion long ago and are now invincible. Nor can we help the new age be born, because we are but creatures of months, and the new age is generations in process of formation. We can but will the Right, not for our particular race or religion or nationality, but the Universal Right, which harms none, and in which each finds its own fulfilment.

One of the principal human duties that devolve during periods of change is *the duty of conscious allegiance.* What do you, *as* a personality and *in* your personality, stand for? And are you standing for it by standing with others who are standing for it? These are questions which are pressing home from many directions today. The bugles of Time are blowing "Assembly" and men are dividing themselves, each according to the moral note within.

It is not a question of allegiance to opinions or programs or philosophies; it is a question of allegiance to moralities. A man may be hopelessly wrong in all his opinion, but if he is morally right, he is of the stuff of the continuing order of life. On the other hand a man may be perfectly correct in his opinions and knowledge, and yet everything he does may collapse and die because of moral anemia. In this time of change it is not a question of having the correct economic theory, it is a question of being loyal to the Right. Immoral or unmoral men never yet constructed an enduring social structure, nor enforced a single beneficial social change.

This coming to conscious allegiance is not always a pleasant experience. Especially in this day when everybody is obsessed more or less with the idea of wanting to be a "good fellow," and when the flabby philosophy of "Boost" has reduced us to spongy masses of saccharine sweetness.

Men have been taught to put even their moral convictions in the background, indeed to possess no obtrusive moral convictions, in order that a false show of fellowship may be made.

This fellowship has now fallen apart. It was based on nothing enduring. It had no meaning except a desire to escape the penalty for being "different," which so many people fear.

It is a time now when conscious allegiance costs something, for it will mean division, and the very first division must be between those who will be loyal to moral conviction and those who will not. And this, quite apart from the consideration of persons or majorities.

The country has had considerable experience lately in the lining up of majorities on questions like Peace and Temperance, and because the majority of the people always believe, as a matter of principle, in Peace and Temperance, it has been made to appear that moral allegiance is always just that easy. It is not. The line-up, impressive as it was, has brought us neither Peace nor Temperance; and no such easy, popular line-up ever will.

The majority of the people are naturally straddlers. They are not in the world to pioneer but to be as happy as possible. If pioneering in a cause brings discomfort, they would rather not. If Truth and Error meet in combat before their gaze, they would rather wait and see which proves the stronger. They may have a lazy faith that Truth at last will win, but it may not be the time as yet, and they do not wish to lend a premature support.

And yet majorities are essential, not to the truth, but to the acknowledgment of the truth; and minorities are essential to the fructifying of majorities. The majority is the sodden dough, the minority the yeast; it is the yeast that changes the character of the dough to something better. Majorities are the position to be taken, as it were; and sometimes Truth takes it, and sometimes Error.

The natural tendency to straddling inheres in most people, and the exceptions to this tendency are not always praiseworthy. There are those who are merely contrary, because they like it; others are contrary because moral allegiance compels them. The majority wants to know if this thing cannot be amicably settled.

No! It cannot be settled. There are some opposites in the world that shall never be reconciled. There are some programs that shall never be harmonized. There are some wars which must continue until one side is exterminated. And that is what frightens some people. They want to be happy; they want to live and let live; they do not want to be bothered. They want leave to enjoy the world as it is, and if there are those who would improve the world, let them do so, but not in a way that interferes with the present schedule.

It is not hard or hardened men that the world needs, but men of moral hardiness who possess spiritual backbones. Men to whom the palliatory "perhaps" comes too easily, who are so impressed with the idea of "relativity" that they seek refuge in a near-vaccum, are men who are lacking in moral gristle. An Idea may be very valuable to them, but they are of no value to the Idea. And the world advances only as Ideas gather believing men about them.

It is a time of taking sides. There is a growing pressure to that end. Whether men desire it or not, the time is rapidly approaching when they will be counted on one side or another. In this country, at least, it may be expected that the majority will finally line up on the right side, but it will be an impressed majority—impressed by the force without in alliance with the still small voice within.

To take sides is not to exhibit prejudice. That is where many people mistake. The men who are freest from any taint of prejudice are those who have taken sides with their convictions, and stand there as sentinels and defenders.

If you want to know where the prejudice in the world lurks, look where there is no taking of sides, where everybody is trying to pretend that there is nothing to take sides about. That is where you will find most of the world's prejudice.

A man who has taken sides is thereby freed from prejudice. His step is open, frank, straightforward. His energies are free to flow naturally. But a man who fears to take a side finds prejudice grow within him like a cancer; it grows from the irritation of an unexpressed antagonism in conflict with an unexpressed allegiance. It is suppression.

However, the movement has set in, and will be complete before the old era completely passes and the new begins. Everyone will have to take his own side. It is not too early now for everyone to begin to ponder on which side he really belongs, and whether, morally belonging to that side, he has the moral hardihood to give that side what belongs to it.

THE time is coming when everybody will have to take sides. Even those who thus far have never stood for anything in particular will have to stand by something in particular. The days of flabby straddling, pretending that there are no differences or divisions, belong to the old era, and the new era will be ushered in with a new consciousness of allegiance. In the last analysis there are only two families on the earth, and every subdivision which has been made relates to one family or the other. The man who is afraid to line up, is not a free man. The times are coming when it will not be within his own choice: he will be forced by the very pressure of circumstances to take his stand by the principles to which he belongs.

America's Most Progressive School District?

People of Ontario, California, Make Such a Claim After Abandoning the Teaching of the Three R's and Taking Up Problems of the Farm

By H. G. TINSLEY

IN THE extreme western end of San Bernardino County, in the beautiful little city of Ontario, in Southern California, is the most progressive district school in the world, say the residents. It is known as the Chaffey High School. Lately when it became more than a high school the title was lengthened to Junior College. All the ancient lore of inculcating the three R's has been abandoned at this institution; the legends which surround the cadaverous schoolmaster and his threadbare coat and his impracticalities are supplanted by a young business man and a farm adviser who doesn't care a rap about Caesar and Nero in Rome, but who does care a good deal what's the matter with the farm cow or why the peach tree does not bear as fruitfully as do some others. Greek gerundives are unthought of in this unique educational institution, but the fact that a farmer does not know what tree disease has affected his orchard is of deep moment.

Chaffey school district comprises 200 square miles. Its taxpaying population is almost entirely agricultural. Ontario is the largest town in the district. Its smaller towns are Etiwanda, Cucamonga, Rochester, Guasti and West Ontario. Everything in the line of fruits and grain is grown in the locality. More than a million dollars' worth of oranges are produced on the Chaffey school district yearly, besides half a million dollars' worth of lemons, millions of dollars' worth of deciduous fruits as peaches, apricots, quinces and a long list of berries and small fruits. The district also is the largest grape area in the world—4,000 acres under one control. Every form of field product known in the realm of agriculture is grown in the district—from a peanut to a 300-pound squash. A more thoroughly agricultural section does not exist. For years the taxpayers growled that their school graduated good enough business men, capable professional men, and men and women as talented and zealous as may be found anywhere, but the one great and growing pursuit of the district had no attention in the school curriculum.

As Crombie Allen, editor of the local daily newspaper, put it to the writer: "Patrons of our school had no complaint to offer at what was a model educational institution but they wanted something more useful to the boys and girls than the old cultural studies. The student was trained well enough, but when he came to succeed to the management of the orchard or farm, as he invariably did, and had to grope for solution of problems that had bothered his father for years, he had to guess and grope just the same as his father had done. The district school turned out splendid specimens of students, but the majority of the taxpayers wanted their children reared in lessons that would be of actual service when their lads became agriculturists and the girls came to meeting the problems in a farm or orchard home.

"Moreover the taxpayers considered that the school should be representative of the spirit of the locality in its horticultural and agricultural industries—a place where the public might take its problems for solution, and there are lots of them daily in agriculture. The men who till the soil in the Chaffey district are universally specialists and one must be right up to his work to succeed in a community of specialists in horticulture. What was wanted was a place where the farmers could learn too. The specialist is always anxious to learn in his line of labor. He hungers for fresh information."

The war in Europe taught its invaluable lessons of the worth of the man who produced food. Naturally the agricultural district about Ontario was concerned. The fact was demonstrated how few people were really trained in food production. The farmer and horticulturist were exalted. Young men longed for instruction in the myriad of facts that one needs to become a progressive tiller of the soil.

Then came the closing of the war and the government's provision for the men who had been incapacitated in the hospitals and trenches in war. Uncle Sam agreed to do his share in rehabilitating the soldier boys and to provide means by which the boys who had been gun-shocked, gassed and blown to pieces might be taught how to earn a living. The trustees of Chaffey and the school principal, Merton Hill, studied the scheme to make an agricultural institution out of the school that should be of practical helpfulness and that did not require a long study in chemistry and higher mathematics to enable one to enter upon the work and which should be a help to the taxpayers in cracking the nutty problems that they must solve or go broke at farming. The principal and school trustees at length devised a district school with farms attached, with citrous groves where the theories of orange and lemon growing may be taught by orchard experts, and a dairy where the thousand and one facts that a dairyman must know to achieve success may be learned.

In other words they planned a junior college of agriculture for the young man with a fair education, and planned to make it rigorously practical—not all bookish as the old-time agricultural college generally is.

The title Junior College was added to the title Chaffey High School. Uncle Sam has so far sent more than 100 service men to take the school course and that brings the district a revenue which helps pay for the additional faculty at Chaffey, and buys the farms and orchards which the school requires. Besides, the district has a steady income from sales of the fruit from the orchards and the fields. Last year more than $17,000 came from sales. It will be much larger this year and as the products of the school acres are better known they will grow more remunerative. The government will probably send more and more service men to Chaffey.

Above—The Library at Chaffey Junior College of Agriculture which contains 15,000 volumes.
Below—Men who are suffering war disabilities are shown here studying root growth in an orchard at the Chaffey Junior College.

Moreover the school would be characteristic of the will of the people in the district. It would help toward the effort made in all rural regions to keep the youths at home, contented with their pursuit and not hasten to the city, against which economists and publicists outcry so lustily nowadays. "We can combine," said an editorial in the Ontario newspaper, "and thus have attractions of the best talent in the world right here at home for the boys and girls, just as big colleges have in other sections of the United States."

That was the reason for this unique educational institution among the tens of thousands of acres of orchards, and the immense vineyards, the fields of sugar beets, all manner of grains, and in the vicinity of great hog ranches and lots of modern dairies, close by Los Angeles.

The head of Chaffey is Merton E. Hill, and upon him is devolved the tremendous problems that this wonderful new kind of a school is working out. Mr. Hill is a most forceful man. Everybody in the district comments upon the importance of his management—to overturn scholarship after a history away back in Aristotle's plane-tree day, thousands of years ago in Greece. Mr. Hill has a long string of college degrees given him for scholarship, but one would instinctively put him in the class of young business. He is quick spoken, arrives at his decision rapidly and is intensely practical. His college degrees indicate his deep erudition.

"Oh, don't think we have turned on all the things that the conventional school teaches or that one goes to the great educational institutions to acquire," said Mr. Hill laughing at my amazement at corrals and herds and barns instead of laboratories. "We are trying here to show the glory in true agriculture. So many men and women do not realize the splendor of making food for the world until they are older. Look around and you'll see that is true. We think that the child taken in hand early in life and shown the beauties of the father's and mother's vocation among the fruits, will be more of a rural soul and will bless those that showed him. I could talk all day on this topic but I won't worry you.

"We here at Chaffey hold the same deep regard for the topics that have been in the curricula of all educational institutions since the earliest academies. They are the adornments of life and the great civilizers of the race. Far be it from any of us to slight them. But this is an agricultural constituency and has a myriad of problems that scholarly men consider it beneath them to heed. Therefore, the young come to have a sort of contempt for husbandry, which the greatest men that the modern nations have produced say is the most important. It is this feeling that a knowledge of bucolic ways is not elevating that is moving so many young people from the farm to the noisome city. This is the sentiment that pictures the farmer as a shiftless, unkempt and tattered fellow, whereas he is the biggest thing a nation can have.

"To put it briefly, Chaffey is doing her best to put the food producer on the kingly throne to which he is entitled. Let me repeat that we try to inculcate a love for husbandry early in life. So far, we feel amply repaid for our foresight and can stand for jeers of the conservative educationalists. See how the first advocates of manual training schools were laughed at for wasting public money in teaching how to saw boards and to drive nails."

Mr. Allen, who is a member of the state assembly and editor of the Ontario *Daily Report*, was near at hand. He expressed the opinion of the taxpayers. "We think it a grand success," said he. "Very few people know the practical tuition Chaffey gives the girls in the district. Here now is the cafeteria. It is all the girls' work and is profitable, too. They have the actual experience of seeing whether their meals are properly prepared, whether the concoctions are right for the public taste. So many domestic science girl students simply experiment and throw away their productions. Look about you, and see the hundreds of mouths these girls feed. If a food is not right, don't you suppose the preparers would hear from it instantly? The 200 square miles of district require students to live at the cafeteria. Some folks come here to board. All the service men have to live here. No domestic science school has such a captious public to serve as they do here.

"It has been the same way with the courses for boys. We feared at first that the grand old studies that make finer men and women would be extinguished in the zeal to teach farming, but we were in error. A lot of us are sticklers for the old conventional studies, even if they are not actual money makers—there are lots of things in this life outside of money.

"We owe it to the government that the Chaffey idea was hastened to what has long been in the taxpayers' minds—to have a first-class farming and domestic science institution here. It cost a heap of dollars, let me assure you. The government wanted an institution that one did not have to spend a year or two in preparing the entrance for actual farming, not a mass of theories. What school taught how to care for hogs and what for bees and hives, for instance? The taxpayers of Chaffey district saw their opportunity. There are enormous possibilities to a wounded man in the various phases of horticulture and agriculture, of which a city-bred man has no conception. The world is crying out for workers who have agricultural knowledge. There are more than 150 heroes of the trenches here now. A sleeveless hero of Argonne was caring for a sick sow at my neighbor's yesterday. He was studying swine diseases. He will go to a hog ranch in Tulare County next fall at $200 a month, for he shows the same splendid qualities in a barnyard that he did when he offered his life for his country."

The universal opinion is that this school has been successful beyond the district's imagination. The intense practicality appeals. Only last week a man of fifty years and his family moved to Ontario from Ohio.

They came with the intention of the father buying an orange grove in a year or two. But he hesitated about putting $35,000 or $40,000 into a citrous grove proposition with absolutely no experience in raising citrous fruits. He would not think of doing that in farming in Ohio. He came with the plan of putting his two sons in the agricultural school at Ontario and himself to enter the class in pomology to learn during his first two years in California to invest more wisely his little fortune in something about which he knew and in which his sons had become experienced at school.

Don't think because the husbandry constituent is in control of Chaffey and that because economy is one of the cardinal features of the school, that it is run scrutinizingly closely. The great beautiful buildings of the institution are marks of artistic skill. The district has put up as elaborate buildings as any community in the country. Hundreds of large cities with their wealth have not spent capital as lavishly or expressed such taste in educational structures as has Chaffey. The writer spent one day in simply going from department to department and observing the exquisite skill of arrangement and the complete furnishings and equipment in the group of buildings, built at an expense of fully $600,000.

But oh, that wonderful school library! It is safe to say that no institution in America has such a building and such conveniences. It is superb. It is a gift of George Chaffey from whom the school takes its name, a pioneer resident of Ontario. He devoted lands to the school. When the foundation fund reached $100,000 the great administration building was the result. The library has now volumes to the number of 15,000. Reference works abound. There are few romances, but the musical and agricultural sections of the library are remarkable in their completeness. Wilbur A. Fiske, the librarian, is working out original plans to make the library as practical as the rest of the school and has classes for instruction in library management.

The department of music denotes the high culture of the people of the district for the delightful things of life. Wonderful in its breadth is the teaching of music at Chaffey, and the great corps of teachers and the complete number of instruments test the liberality of the taxpayers for musical instruction where the range is unusually wide. Only now a $20,000 pipe organ is to be installed in the great auditorium of the institution and pipe organ playing will be a new course of tuition in this wonderful district school. Think of a great pipe organ installed in a public high school!

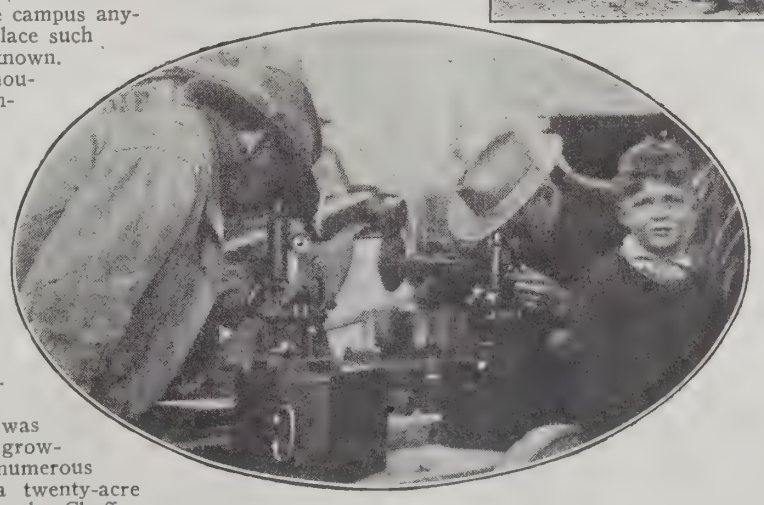
The visitor at Chaffey notes the appeal to the esthetic everywhere. The architecture is tasteful; the lawns and beds of flowers are artistically arranged. The classrooms and music apartments are models of cheerfulness and sunshine. One can walk about this marvelous institution of an agricultural district with a joy for hours. There are now in attendance 1,000 students.

There certainly is no school or college campus anywhere like that at Chaffey. In the first place such a combination of utility and beauty is unknown. There are thirty acres in the campus. Thousands of schools have no campus. Hundreds of colleges have only an acre or two of campus. But, you know, this Chaffey is different. Seven acres of the campus are occupied by buildings. Then there are thirteen acres of the campus occupied by a grove of all varieties of citrous fruit trees—the school working spot of the classes in citrous pomology. The grove proved such a capital one that a little later another citrous grove was bought and planted to display various varieties of trees under every horticultural circumstance.

A grove of deciduous fruit trees was needed to conduct investigations into the growing of plums, peaches, apricots, and the numerous variety in the deciduous family, and a twenty-acre orchard three miles distant was added to the Chaffey assets.

Besides, there is the sixty-acre general farm connected with the school. There experiments are conducted in every form of farming and classes of students are taken daily. Then too, the district controls an area in the canyon north of the school where bee culture is carried on and where berries and small fruits are studied.

The cultivation of the orchards and fields is done chiefly by the students. There are constantly going forward experiments in citrous and deciduous horticulture. People in the district bring to high school specimens of plants and tree branches for elucidation. Problems that perplex the tillers of the soil are laid before the high school authorities and are up to the classes to be solved.



For instance, the day the writer was looking over Chaffey school, a farmer complained that his peach orchard had been so improperly pruned the year before that the operation had cost him heavily in slim fruitage. He asked George P. Weldon, the pomological teacher, to bring his class to the orchard and demonstrate what correct peach pruning was.

That afternoon Professor Weldon took his class of thirty young men to the farmer's orchard. He first expatiated upon the several varieties of peach trees growing there, and while the class took notes he told the fruiting characteristics of each sort of tree and gave a scientific demonstration of the difference in foliage or fruit twigs. Then he pruned the trees, explaining why he cut in each instance. As Professor Weldon clipped away at the peach trees, he dwelt upon the reason for his acts and what to expect in a crop from the next fruitage. That is the sort of practical tuition that Chaffey gives daily.

"You will observe," said Mr. Weldon, "that we make a strong feature of the actualities of things agricultural. So many institutions teach only from books and charts. An hour in the orchard is, to our minds, more useful to the lad than hours of book education. A boy can study and recite about how a scale pest looks and how it may sap the life of a tree, but one hour in observing what has been done to an orchard by a scale pest is as good as a score of books on the subject. A lesson by a director with a hog, pointing out what points make for a good beast and what characteristics are transmitted in the progeny, is as instructive to a class of boys as a week over a textbook. Besides, it arouses a boy as no classroom study will ever do.

Right—Another demonstration of the nicotine dust spray.

Below—Examining peach thrips under the microscope.

"I never miss an opportunity to take my students with me to the country. I have one thing in view when I set out—to show what a diseased tree is doing and what the treatment is accomplishing and why, and especially how to diagnose an orchard disease as soon as it appears, for, like human beings, the proverbial stitch in time is just as applicable to the orchard as to a person. Lessons in pruning fruit trees can only be learned from the actual labor and with criticism of why this or that is done. A teacher can talk a week about the rinderpest in ruminants, but the class that can see a case of the heifer disease in a barn will have invaluable instruction. That is why we have bought the farms, herds, groves, and have swarms to run in connection with our educational system.

"The field is constantly widening. When manual training schools were first opened in schools the idea was ridiculed. How the nation smiled a generation ago when Cornell University opened an agricultural department. I recall that the older and more conservative college men called Cornell then the cow college. Who would have considered a pedigreed bull an adjunct of a district school, several years ago? Yet that was deemed part of the apparatus of Chaffey school two years ago. We shall buy another bull of a different breed soon.

"The whole idea here is to be intensely practical and we are working along that line. Do not think we are casting aside the fine elements in character building and are scorning scholarship and hundreds of things of the good old curriculum of education. They are taught here, too. But the contention is that many a boy and girl is forced to take up a curriculum that is worse than useless because there is no liking for the course while another would arouse his largest energies.

We look at once to a student's taste. Many boys will work their heads off to succeed in horticulture who would not be worth a rye's straw in the classroom. The case is vice versa too. The trouble with most schools is that pupils go on for years with scholasticism that is worse than distasteful. Our farming offers the chance to a boy to work according to his bent after he has mastered the essentials of the schoolroom. We took the class in pomology to see the county fair at Riverside and the talk we gave on the horticultural exhibit was referred to for weeks. I showed how gum disease ruined a $35,000 orange grove out in the country, and that was as beneficial as lectures all winter."

The average day in the life of the average pupil in the agricultural department at Chaffey is like this: Recitations and lectures in the morning on topics connected with the economy of agriculture, the qualities of the soil, the treatment of soils to produce certain results, all matters of pomology, how to care for and to select domestic animals, and how to keep accounts on a farm, and how to judge the value of a crop according to a business man's method, especially upon agricultural appraisement from a scientific business point of view.

In the afternoon the out-of-door work in the orchard and field study takes place. It is scheduled days in advance so that all the class may be there. The teacher in pomology always investigates and observes the treatment of trees by a certain variety of fertilizer, the destruction of a scale pest, the systematic pruning of a fruit tree or the differentiation of fruit from foliage twigs. As the instructor demonstrates, he lectures on what the student should observe and remember. The teachers in farming have demonstrations at the school farm every afternoon. Generally there is some agriculturist of the vicinity along, some one who has come purposely to learn that one topic at the school. There are demonstrations of what agency has grown a prolific crop of grain, the best way to treat hay in drying, what ails a dumpy cow or a hog or a goat or a sheep. There are lessons in soil drainage, in growing wheat and alfalfa, feeding swine and curing pork. Every conceivable topic that enters into daily farm conduct is expatiated upon by the farm teachers. It is all practical in the extreme.

The classes in dairying are always filled. The work in the classroom comprises a scientific knowledge of all tests of milk, how it can be best preserved, what have proved the most liberal producers of the lacteal fluid. Diseases of cattle are studied and how to diagnose and cure them. Every phase of cattle care is studied. The class spends each afternoon at the farm, where take place demonstrations of the milk production of all the varieties of heifers, and hundreds of tests of food upon the animals.

Thus the tuition goes forward. Every day has its scheduled period of actual work in the orchard and field. Matched contests between the classes occur frequently and add an interest to farming and horticulture. Thus there are plowing teams one time and fruit picking another. Competition to grow the better grain by a certain agricultural preparation; competition in largest milkings and largest peaches, juiciest oranges, and most succulent figs is of constant occurrence.

A daily topic of argument in the general farming class is how deep to plow for this or that grain and how best to till to conserve moisture in a dry area.

In the fall of the year and when the Ontario canneries are packing millions of quarts of peaches, apricots, tomatoes and small fruits the classes in pomology are taken to the canneries to see what is wanted from the orchardists and what varieties are most popular. In the orange packing season, young men hire themselves out to the fruit packers and earn money for their tuition.

"I thank my stars," said Lieutenant George W. Watson, a boyish veteran of Verdun, one of the service men at Chaffey, "that I had sense enough to select agriculture as my rehabilitation Uncle Sam agreed to give disabled gas victims of the trenches. So many of my army chums chose the fixing of automobiles and typewriting. I look upon the production of foods as among the grandest occupations that can concern men. The war taught us that.

"Then see what pay an agricultural expert earns. A man who knows how to prune a $40,000 orange orchard gets $20 a day for weeks. I have known a lemon authority, who was with me in France, to get even $350 for pruning a ten-acre grove. An ignorant man with a saw and a knife in a citrous grove can ruin a $10,000 crop in a few days.

"That is what we are learning here."

Taft Once Tried to Resist Jews—and Failed

As President He Attempted to Defeat a Jewish Plan Against U. S. Foreign Relations, But the Jews Tamed Him to Docility in Their Service

WILLIAM HOWARD TAFT is an amiable gentleman. There is so much to agree with in the world that he seldom finds it possible to disagree with anything. It is a very comfortable attitude for one to assume, but it doesn't push the world along. Real harmony is wrung out of discord by laboring against disagreeable facts; it is not achieved by mere pit-pats on the back of untoward conditions.

There is no doubt that had one approached William Howard Taft a year ago and said: "Mr. Taft, you know there are evil forces in the world which ought to be resisted," he would have replied, "Certainly, by all means."

If one had said, "Mr. Taft, some of this evil is just ignorant inclination, which can be dealt with by various means of enlightenment, but some of it represents a deliberate philosophy which has gathered about itself a definite organization for action," he would have responded: "I am afraid it is true."

And then had one said: "Mr. Taft, the people should be made aware of this, given a key to it, that they may keep their eyes open and learn the meaning of certain tendencies that have puzzled them," he would in all likelihood have replied, "I believe in enlightening the public mind that it may take care of itself."

Suppose you had added: "Mr. Taft, if you found a written program setting forth the steps to be taken to fasten a certain control on society, and if on looking about you observed a definite set of tendencies which seemed to parallel the program at every point, would it appear to you significant?"

Mr. Taft would, of course, answer, Yes. There is no other answer to make. No other answer has been made by anyone who has compared the two things.

If Mr. Taft had been approached first on that side of the question, he would have uttered words very valuable to those who would attach value to his words.

But what has Mr. Taft's "testimonial" to do with either side of the case? Does his support strengthen it, or does his opposition weaken it? If it came to a battle of names, THE DEARBORN INDEPENDENT could present a very imposing list of men who acknowledge the importance of the studies being made, and who agree with most of the observations presented. But such a list would add nothing to the facts in the case, and facts must stand on their own foundation regardless of the attitude of Mr. Taft, or even Mr. Arthur Brisbane.

But there is a very interesting story about Mr. Taft and the Jews. Mr. Taft knows it and can verify it. A number of American Jews also know it. And it may perhaps be useful to tell it now.

Does Mr. Taft Really Know Anything About It?

HOWEVER, that we may not seem too desirous of evading Mr. Taft's latest defense of the Jews, we shall begin with that.

Unduly stirred by this series of studies, the leading Jews of the United States indicated by their perturbation that the truth in these articles made it impossible to ignore them. Perhaps as many people have been inclined toward agreement with the articles by the attitude of the Jews themselves as by the statements made in the articles. Jewish defense has been made with great formality and show of authority, but without the hoped-for effect. The Jews of the United States, evidently finding that their own statements have failed to carry, are making a wholesale conscription of Gentiles for purposes of defense. As in Russia, the Gentiles are being pushed into the firing lines.

Mr. Taft was therefore approached with a proposition. That was some time ago, probably about November first.

Now, according to Mr. Taft's own signed statement made on November 1, he had not even read THE DEARBORN INDEPENDENT'S *articles but was taking the Jews' word for their character and contents. And yet, on December 23, we find Mr. Taft in Chicago at the La Salle Hotel, delivering an oration before the B'nai B'rith, uttering his statements with all the finality of a man who had made a deep study of the Jewish Question and had at last attained a mature conclusion.*

On November 1, Mr. Taft wrote to a New York Jew deprecating these articles as "a foolish pronouncement *which I understand has been issued* through THE DEARBORN INDEPENDENT." The expression, *"which I understand"* is equivalent in ordinary speech to "which I have heard." He had not read them. He was taking *hearsay* on which to base his opinion. There are signs that he had not read them even at the time of his speech in Chicago, for he did not so much as allude to one of the startling parallels which have weighed on the minds of many important men in this country.

The Jews wanted Mr. Taft's name, they wanted "a Gentile front," and they got it. The speech contributes nothing to the discussion; it proves nothing, it disproves nothing. In parts it is a rehash of a speech delivered by a New York rabbi. Indeed, one of William Howard Taft's most telling points was the almost verbal repetition of a point made by that rabbi.

Mr. Taft's business now is the delivery of addresses. Between November 1, at which time he had not read the Jewish Question at all, until December 23, when he presumed to pronounce judgment on it for all time, he had been away a great deal on the road. Indeed, he reached Chicago without having done any of his Christmas shopping. He explained that he had "been traveling over the country so fast" that his time had all been taken up. Where he found time to study the Jewish Question does not appear. It is most probable that he had no time and did no studying. If he did, he carefully concealed the fruits of it when delivering his address.

A Headliner—For Advertising Purposes Only

BEFORE his address was delivered, the newspapers had announced that it was to be made against "anti-Semitism," and this series of articles was specified. It was apparently foreknown, therefore, that not a judicial pronouncement was to be expected from Mr. Taft, but a partisan plea. The newspapers indicate that Mr. Taft had not even dictated his speech until he reached Chicago. The material he had at hand during his dictation was the printed propaganda with which the Jews have been flooding the country. Taft's speech reeks with it. There isn't an original idea in it. He was the human megaphone whom the Jews retained for one night through whom to voice their words. The real purpose of the speech was, of course, to secure its publication throughout the country as the voice of the people on the Question. But nothing whatever excuses the fact that the speech contains absolutely no contribution to the Question.

Mr. Taft is against religious prejudice. So is everybody else. Mr. Taft is against racial prejudice. So is everybody else. Mr. Taft wants concord and good will. So does everybody else. But what have these to do with the facts which comprise the Jewish Question?

The real story of Mr. Taft and the Jews begins back in the time when Mr. Taft lived in the White House. The Jews maintain a lobby in Washington whose business it is to know every President and every prospective President, and, of course, Mr. Taft was known to them a long while before he was made President, but whether they did not foresee his political future or whether they considered his opinions as having too little force for them to bother about, is not clear, but the fact seems to be that very little fuss was made about him. There are no indications that he ran after the Jews or the Jews after him in the days before his presidency.

As President, Mr. Taft once stood out against the Jews, was strongly denounced as unfavorable to the Jews, was soundly beaten by the Jews in a matter on which he had taken a firm stand, and has ever since shown that he has learned his lesson by accommodating the Jews in their desires.

The story involves a portion of that voluminous history which consists of the quarrels between the United States and other nations on account of the Jews. Readers interested in this phase of the history of the United States can find it fully set out by Jewish writers. There seems to be a certain pride taken in recounting the number of times the nations have been compelled to give diplomatic recognition to the Jewish Question. From 1840 until 1911, the United States had special diplomatic trouble concerning the Jews. The trouble that culminated during 1911, in an unparalleled act by the United States, involved William Howard Taft, who then was President.

The Jews Embroil Russia and U. S.

FOR centuries, Russia has had her own troubles with the Jews and, as the world knows, has at last fallen prostrate before the Jewish power which for centuries has been working to undermine her. Even Disraeli was not blinded to the fact that Jews had a control over Russia which the rest of the world never knew. The biggest hoax in modern times was the propaganda against Russia as the persecutor of the Jews. Russia devoted to the Jews a large part of the most favored section of the land, and was always so lax in those laws which prohibited Jews from settling in other parts of the country that the Jew was able to create an underground system throughout the whole of Russia which controlled the grain trade, controlled public opinion and utterly baffled the czar's government. The cry of "persecution" arose because the Jews were not permitted to exploit the peasants as much as they desired. They have, however, gained that privilege since.

Now, when the United States appeared as "the new Jerusalem," its Jewish citizens conceived the idea of using the American Government to achieve for the Jews what other means had failed to achieve. Russian and German Jews would come to the United States, become naturalized as quickly as possible, and go back to Russia as "Americans" to engage in trade. Russia knew them as Jews and held them to be subject to the laws relating to Jews.

Protest after protest reached the State Department as more and more German or Russian Jews went back to Russia to circumvent the Russian laws. At first the matter was not serious, because it was shown in many cases that these naturalized "Americans" did not intend to return to the United States at all, but had acquired "American citizenship" solely as a business asset in Russia. In these cases, of course, the United States did not feel obligated to bestir herself.

The time came, however, when American ministers to Russia were requested to look into the situation. Their reports are accessible. John W. Foster was one of these ministers and he reported in 1880 that "Russia would be glad to give liberal treatment to bona fide American citizens, *not disguised German Jews.*"

During all this time the "Russian question" was being sedulously propagated in the United States. It appeared first in the aspect of the "Russian persecutions." The Jews represented that their life in Russia was a hell. John W. Foster, later Secretary of State, father-in-law of Robert Lansing, the recently resigned Secretary of State under President Wilson, was at that time representing the United States in Russia, and he reported as follows on the status of the Russian Jews:

> ". . . . in all the cities of Russia the number of Jewish residents will be found more or less in excess of the police registry and greater than the strict interpretation of the law authorizes. For instance, persons who have given the subject close attention estimate the number of Jewish residents in St. Petersburg at 30,000, while it is stated the number registered by the police authorities is 1,500. From the same source I learn that . . . . while only one Hebrew school is registered by the police, there are between three and four thousand children in unauthorized Jewish schools of this capital. As another indication of the extent of Jewish influence, it is worthy of note that one or more Jewish editors or writers are said to be employed on the leading newspapers of St. Petersburg and Moscow almost without exception . . . ."

U. S. Ambassadors Learn the Truth

AT EVERY turn, the United States Government discovered that the Jews were exaggerating their difficulties for the purpose of forcing government action.

Presently, after years of underground work and open propaganda against Russia in the daily press, until the American conception of Russia was fixed almost beyond correction, the agitation took the form of the "Russian passport question." Russia dares to flout an American passport! Russia insults the government of the United States! Russia degrades American citizens! And so forth and so on.

Jews in the United States demanded nothing less than that the United States break all treaty relations with Russia. They *demanded* it! James G. Blaine desired one thing more than another, which was this: that something, anything, be done to block the flood of Jewish immigration then beginning to flood the country. *"The hospitality of a nation should not be turned into a burden,"* he wrote.

There was then the strange situation of the United States itself making complaints about the Jews and at the same time being asked to question Russia's right to handle similar complaints in her own domain. The minister of foreign affairs for Russia appreciated this point, and when the American minister told him that 200,000 Jews had emigrated to the United States from Russia, he rejoined: "If such a number of people had gone to the United States as *workers* to aid in developing the country he supposed they would be acceptable, *but if they went to exploit the American people, he could understand how objectionable it was.*" Of course, the whole point with Russia was that the Jews were exploiting her. They were milking Russia, not feeding her.

If space permitted, much rich material could be presented here. The attitude of the American states-

men of 25 to 40 years ago, on questions of immigration and racial propaganda, was eminently wise and sound.

So, until the days of William Howard Taft, this Jewish propaganda continued, always aimed at Russia, always planning to use the United States as the club with which to strike the blow.

It must be borne in mind at all times that the Jews maintain a lobby at Washington, a sort of embassy from the Jewish Nation to the Government of the United States, and this lobby is in the hands of a principal "ambassador." It was, of course, this ambassador's business to get hold of President Taft as firmly as possible.

But President Taft was not at that time so "easy" as the people have since been taught to regard him. There was a commercial treaty between Russia and the United States, and it had existed since 1832, and President Taft behaved as if he thought the Jewish demand that the treaty be broken was rather too much. The Jewish demand was that the United States denounce a treaty which had existed between the two countries for almost 80 years, and during the life of which Russia had repeatedly proved herself to be a reliable friend of this country.

Once Mr. Taft Stood Firm

THE Jews wanted just two things from William Howard Taft: the abrogation of the Russian treaty and the veto of what Congress has repeatedly tried to do, namely, put a literacy test on immigrants. Jewish immigration into the United States being so important an element of Jewish plans, American Jews have never cared what kind of human riffraff filled the country as long as the Jewish flood was not hindered.

Presently, President Taft had undergone the persistent nagging characteristic of such campaigns and had asked, perhaps impatiently, what they wanted him to do.

"Have a conference with some of the leaders of American Jewry" was the proposal made to him, and on February 15, 1911, there walked into the White House, Jacob H. Schiff, Jacob Furth, Louis Marshall, Adolph Kraus and Judge Henry M. Goldfogle. They had lunch with the President's family and adjourned to the library.

The President was fairly wise in the matter. There was no chance whatever for him in an argument. His guests had come prepared to talk, to "tell" him, as some of the same men lately "told" an eastern publisher, pounding the table and uttering threats. The President was to be overwhelmed, his good nature carried with a rush.

But, instead of anything like that, the President, as soon as they gathered in the library, took out a paper and began to read his conclusions! That staggered the Jewish ambassadors at once—the President was reading his *conclusions!* He was "telling" *them!*

The President's statement is really worth reading, but it is far too lengthy to present here. He called attention to the right which this country exercised to say who shall and who shall not sojourn here, and also to the conflicting interpretations which American secretaries of State had given the Russian treaty. He contrasted with that Russia's consistent interpretation from the beginning. He then said that the treaty was sacred because under it for more than 50 years the citizens of the United States had made their investments in Russia—resting solely on their faith in the United States' and Russia's treaty honor. He said that if it were a new treaty that was being written, the case would be different; he would then consider the Jewish argument of weight. But, he said, we had other treaties with other countries who did not always share our views as to what certain sections of the treaties meant, but we have lived and worked under them. He instanced the Italian treaty with regard to the extradition of criminals. He wished to impress on the Jewish ambassadors that they wanted to make an exception of their case, which, of course, they did.

"This Means War," Said the Jews

THE President then said he would be willing to consider taking some action if he did not believe that in taking action he would be endangering the status the Jews already enjoyed in Russia. If this treaty were denounced, large American interests would be jeopardized (here the President mentioned certain interests, all Gentile).

He said he liked to see Russian Jews come into the country, but added "the more we spread them out in the West, the better I like it." He ended with a plea for the Jewish ambassadors there present to consider the plight which denunciation of the treaty might involve Russian Jews, and ended with the words—"That is the way it has struck me, gentlemen. That is the conclusion I have reached."

The Jewish group was plainly taken aback. Simon Wolf, who was always on guard at Washington, said, "Please, Mr. President, do not give to the Press such conclusions," but Jacob H. Schiff broke in with a voice vibrant with anger—"I want it published. I want the whole world to know the President's attitude."

The discussion then opened, with the President cool and self-contained. Finally, after some useless talk, and having other business to attend to, he gave them a letter just received from the American Ambassador at St. Petersburg, Mr. Rockhill. Mr. Rockhill presented in that letter to the President the whole Russian contention about the Jews—statements which have been confirmed a thousand times by the events that have since occurred.

They then renewed their expostulations and arguments, but to no avail. The President expressed regret, but said he could see no other course to pursue; he had studied the question in all its lights, and his conclusion was as stated.

On leaving the White House, Jacob Schiff refused to shake the President's hand, but brushed it by with an air of offended power.

"Wasn't Mr. Schiff angry yesterday!" exclaimed the President the next day.

But the President did not know what was going on. When Jacob Schiff was descending the White House steps he said, "This means war." He gave orders to draw on him for a large sum of money. He wrote a curt letter to President Taft. The President sent Mr. Schiff's letter and the reply to the Secretary of Commerce and Labor, Charles Nagel, who replied to the President with these words: "I am very much impressed with the patience which you exhibit in your answer."

Neither did the President know what was behind it all. Look at most of the names of the men who represented American Jewry in the White House that 15th of February, 1911. And then consider that the abrogation of the Russian treaty would throw all the vast business between the United States and Russia into Germany, into the hands of German Jews. The Frankfort bankers and their relatives in the United States knew what that meant. It meant that German Jews would be the intermediaries of trade between Russia and the United States. The business itself meant money, but the relation meant power over Russia—and Jacob H. Schiff lived to overthrow Russia. The neutrality of the United States was torn to shreds by a movement organized and financed on American soil for the overthrow of a friendly nation, and the organizers and financiers were Jews! They used their internal power to deflect the policy of the United States to assist their plans.

The game was financial and revolutionary. It was decreed. It was the then part of the program to be accomplished, and the United States was to be used as the crowbar to batter down the walls.

When the Jewish ambassadors left the White House, orders flew from Washington and New York to every part of the United States, and the Jewish "nagging" drive began. It had a center in every city. It was focused on every Representative and Senator—no official, however, was too mean or unimportant to be drafted.

Frankfort-on-the-Main Defeats U. S.

AMERICAN editors may remember that drive; it was operated on precisely the same lines as the one which is proceeding against the Press today. The Jews have furnished absolute proof in the last two months that they control the majority of the American press. There are signs, however, that their control does not mean anything, and will not last long.

Jacob Schiff had said on February 15, "This means war." He had ordered a large sum of money used for that purpose. The American Jewish Committee, B'nai B'rith and others of the numerous organizations of Jewry (how well organized they are the signatories of the recent Jewish defense prove) went to work and on December 13 of the same year—almost 10 months to a day after Jewry had declared war on President Taft's conclusions—both houses of Congress ordered President Taft to notify Russia that the treaty with Russia would be terminated.

Frankfort-on-the-Main had won!

In the meantime, of course, the Jewish press of the United States berated President Taft with characteristic Jewish unreserve. It would be an eye opener if, at every speech which William Howard Taft makes for his Jewish clients, there could be distributed copies of the remarks printed about President Taft by those same clients nine years ago.

The methods by which the Jews set forth to force congressional action are all known, and the glee with which Jewry hailed the event is also known. Two governments had been beaten—the American and the Russian! And an American President had been reversed!

Whether this had anything to do with the fact that William Howard Taft became that unusual figure—a one-term President—this chronicle does not undertake to say.

The Making of a "Gentile Front"

THERE was quite a scurry for cover at that time. Taft had been beaten, and all the men who had stood beside him ran in out of the storm. John Hays Hammond was represented as having been sympathetic with the Russian view of the Jews—as most of the American representatives were. As late as 1917, William Howard Taft, then a private citizen, wrote to the principal Jewish lobbyist at Washington asking that Mr. Hammond be not held up in Jewish histories as one who had opposed the breaking of the Russian treaty.

The President had really done what he could to prevent the Jewish plan going through. On February 15, 1911, he withstood them face to face. On December 13, 1911, they had whipped him.

And yet in the next year, 1912, a peculiar thing occurred: the high officials of the B'nai B'rith went to the White House and there pinned on the breast of President Taft a medal which marked him as "the man who had contributed most during the year to the welfare of the Jewish cause."

There is a photograph extant of President Taft standing on the south portico of the White House, in the midst of a group of prominent Jews, and the President is wearing his medal. He is not smiling.

But even after that, the Jews were not sure of President Taft. There was a fear, expressed by private letters between prominent Jews, and also in the Jewish press, that President Taft, while officially abrogating the treaty, would consent to some working agreement which would amount to about the same thing. There were cables from Jews in Russia, stating that Taft would do that. The President was closely watched. Whenever there was an open chink in his daily program, he was approached on the matter. It was made utterly impossible for him to do anything to patch up the differences. Frankfort was to have the handling of American trade with Russia, and Jewry was to have that club over Russia. Money, more and more money, always accompanies every Jewish plan for racial or political power. They make the world pay them for subjugating it. And their first cinch-hold on Russia they won in the United States. The end of that American influence was the rise of Bolshevism, the destruction of Russia, and the murder of Nicholas Romanoff and his family.

That is the story of William Howard Taft's efforts to withstand the Jews, and how they broke him. It is probably worth knowing in view of the fact that he has become one of those "Gentile fronts" which the Jews use for their own defense.

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

Oscar Straus is reported in the press as having conferred with President-elect Harding in the hope of having a Jew appointed American ambassador to Germany. Mr. Straus feels it would be a proper rebuke of Germany's impudence in exposing the part the Jew had in causing that country's poverty and disorder. In like manner the Jews importuned W. J. Bryan, when Secretary of State, to appoint a Jew as United States minister to Spain, to rebuke Spain for having expelled the Jews several centuries ago. Considering the number of Jews now representing foreign countries at Washington, it might be a return compliment to Judaize the entire American diplomatic corps. On reflection, however, the Judaization is now so nearly complete that it might be well to reserve one or two places as an acknowledgment that there are still Gentiles in the United States.

Vienna Jews are reported as having supported the Christian Socialist party in the recent elections, ousting Jewish members from Parliament.

Conservative Jews advise a halt in the gleeful zeal with which certain Jewish organizations threw themselves into the work of breaking up the Christian Sunday. "Let the Christians destroy it themselves," is the conservative plea.

The Jews are now providing the proof of many statements made against them. They have been charged with being a close anti-Gentile corporation; they are proving it. They have been charged with possessing a perfectly organized instrument for coercion of the Press; they are proving it. They have been charged with controlling the gold, handing it out and withdrawing it at will, in order to shove business up or down as suits their purpose; they are proving it. They have been charged with naturally resorting to violence and coercion; their wide preaching of the boycott, the secondary and even tertiary boycott; the actions of many Jewish organizations prove it. By the time the alleged "half-truths" are separated into their parts, the truth-part is astonishingly important.

Great Honor—Limited Powers

By BERNARD G. PRIESTLEY

"IT IS an office of great honor and very limited powers."

Vice president-elect Calvin Coolidge made this reply when asked to define the vice presidency.

The question was put to him in the executive offices of the governor of Massachusetts, under the gilded dome of the State House in Boston. As is characteristic of the man who is to team up with President-elect Warren G. Harding for the next four years, the governor did not reply until he had weighed the question.

"Without power there is no great responsibility," he added. "Every office, however, is as great as the person who fills it. The vice presidency having been held by men of great distinction has held a high place in the estimation of the American people."

That was as far as the coming vice president desired to go on the subject at that time. He remarked that he did not think the time opportune to tell what he would or wouldn't do when he assumed office.

The question arises: What will Governor Coolidge do as vice president? Will he be taken into the cabinet of President Harding, as the latter has suggested? Will he be requested, as has been suggested also, to take charge of the preparation of a national budget? Or will he be asked to dispose of any of the thousand and one readjustment period problems that are howling at the door of the national government?

What are the prospects of the vice president-elect sitting with the cabinet—in an official capacity? If we are to abide by the Constitution of the United States to the letter they seem very remote. According to Section 3, Article 1 of the Constitution: "The vice president of the United States shall be president of the Senate, but shall have no vote, unless they be equally divided."

Although clearly and at length the Constitution defines the duties of the President, it makes no further provision regarding the vice president other than:

That he shall succeed to the Presidency in case "of the removal of the President from office, or of his death, resignation, or inability to discharge the powers and duties of the said office . . . ."

That he may be removed from office on impeachment for and conviction of treason, bribery and other high crimes or misdemeanors. Some legal light may be able to find in the Constitution a section that may be interpreted to give Mr. Harding the authority to appoint Mr. Coolidge as an official member of his cabinet, but to the layman the chances of such a discovery seem on par with the Bolshevists' chances of sweeping the world clean of "Law and Order" sympathizers with their whiskers. Of course, Mr. Coolidge might become an unofficial member of the cabinet, but without authority the most he could do would be to act in an advisory capacity and there would be no responsibility attached to whatever he did. Even under such conditions it is very doubtful if he would have the right, while filling the office of vice president, to sit with the cabinet.

Returning to the matter of whether Mr. Coolidge shall be delegated to supervise the preparation of a national budget, again, it would seem, the Constitution steps in with a forbidding hand raised on high. The Constitution does not give the vice president any authority to delve into preparation of national budgets. If some loophole could be found in the Constitution—and again the layman fails to see any prospects of such a discovery—Mr. Harding might appoint Mr. Coolidge to preside over budget activities. Then, once more, the question arises: Could Mr. Coolidge serve legally in the double capacity? Or if he was appointed unofficially, where would he get the authority to rule as to what should or should not be in the budget? And would not the appointment of any person without authority to preside over the budget preparation seem as out of place as sending a fireman wearing a celluloid uniform into a blazing building?

Concerning the various tasks that friends have insisted be thrust upon Mr. Coolidge, on his induction into office—again we have our old friend the Constitution with which to contend. Again are resurrected the questions of the legality of selecting Mr. Coolidge to do anything but preside over the Senate, of his right to take up the tasks if appointed and of the plausibility of having him act in an unofficial capacity in an effort to slip one over on the Constitution.

But Calvin Coolidge is a "Big Man," known from coast to coast, Canada to the Gulf; his friends and political bedfellows desire to see him become something more than "just the vice president." How are they going to accomplish their end, legally? When suffragist leaders wanted to give women the vote and the Constitution blocked them they fought for many years to obtain a victory through an amendment to the Constitution. Prohibition leaders followed the same long, hard road before they were able to place an official "Gone—But Not Forgotten" placard on John Barleycorn's front door. Will the followers of Mr. Coolidge, and they are legion, try the same method in order to obtain unquestioned authority to enlarge the office of the vice president? Time will answer the question.

(C) Harris & Ewing
CALVIN COOLIDGE,
Vice President-elect

In order to change even a punctuation mark of the Constitution it is necessary for Congress to pass favorably on the proposed change and for three-fourths of the states to ratify the action before it can be made. If the suffrage and prohibition fights are any criterions to go by, any move to change the Constitution so that the vice presidency would be enlarged would encounter strong opposition. Yet there are thousands upon thousands of voters, no doubt, who feel that the vice president (meaning every vice-president) should have power bestowed upon him in keeping with the honor of his office, the second greatest honor the American people can confer. It would be easy enough for Congress to pass a proposed amendment giving the vice-president "such additional power as Congress or the President, with the approval of Congress, may see fit to assign to the vice president from time to time." But considerable time would be bound to elapse before three-quarters of the states ratified the act, even if no strenuous opposition developed.

Until some Constitutional amendment of the sort is passed and ratified, it appears as though the vice president, whoever he may be, must be satisfied with honor instead of power.

At the present time the vice president has no authority in the White House, nor has he authority in the House of Representatives, other than that of a spectator. While the President is commander-in-chief of the American military forces, the vice president has no official right to wear a sword. Innumerable instances could be cited where the President has power and the vice president, who may be called upon at any time to succeed him because of death or for other reasons, has no power.

Truly, "it is an office of great honor and very limited powers."

Hunting America's Last Bears

Concluded from page 3

of the swamp, which is so thick that one can see scarcely more than 25 feet, while the hounds were running still other bears.

Deer were almost as plentiful as bear in the swamp. Mr. McIlhenny reported seeing four in one afternoon, and their tracks and "sign" were met with by dozens every day. No attempt was made to hunt them, since to do so would ruin the hounds for bear hunting. Many deer are killed by the trappers during the winters, while the animals are swimming across the bayous, but few bear are killed that way. The deer swims with his head well out of the water, but the bear leaves nothing exposed but the very crown of his head and the tip of his nose when he swims, so that he furnishes a mark—even when a large bear—about the size of a man's hand, moving rapidly across the stream.

The great swamp, which occupies, all told, about 12,000 square miles of Louisiana's surface, and over a very small part of which we hunted, is probably the last haunt, in the United States, of bears in any numbers. But there must be thousands of bears in all that extent of lowland, from Pearl River—the boundary of Louisiana and Mississippi—on the east, to the Sabine River—the boundary of Louisiana and Texas—on the west. There are also many, many deer, probably more than there are in any other equal area in the United States, though Southern Mexico leads the world in the number of deer still there.

The bears are the Louisiana black bear, rather smaller than the cinnamon bear of the West and Northwest, and considerably smaller than the grizzly or the "silvertip" of Northern California. Yet these Louisiana black bears range to nearly 700 pounds, the largest one killed, of which there is record, having been shot by E. A. McIlhenny, near Avery Island, in 1916. That bear, as has been said, weighed 671 pounds, and one of the bears killed on the recent hunt weighed approximately 400 pounds, a rather good size.

The deer are the white-tail, with no black-tails among them, and they run slightly smaller than the white-tails of Minnesota and Wisconsin, some of them, especially the does, not much larger than the little spotted Axis deer of Indo-China. The trappers kill their deer without hounds, by drifting in a small boat down the bayous and shooting the animals as they come to drink or to cross these sluggish streams. Doubtless, too, owing to the difficulty of travel through the undergrowth of these palmetto swamps, there will be bear and deer in the Louisiana marsh long after they have been exterminated everywhere else in the United States, except in the national parks and the zoological gardens.

The Wood Hollow Papers

By ROBERT PAGE LINCOLN

ON MY walk today a crew of snow buntings rose from a ragweed hedge at the swamp. I paused and watched them as they again dropped to the snow and busied themselves at picking up the seeds that the withered stalks afforded The snow bunting is a soul of indefatigible charm, the very theme of merry abandonment and is perfectly at home in the high-piling, sifting, eternally shifting snowdrifts. The colder and more dismal the day the more enthusiastically do they rise out of winter's very heart. In the winter the snow bunting still retains his white coloration though it is somewhat mixed with brown so that it appears clouded. It has sparrowy colored wings with white through them. The back partakes of a grayish coloration; a means to identification being the streak at the shoulders. The change in coloration that the snow bunting undergoes is perfectly in keeping with its environment. Its coloration of white, touched up with the darker shades, is such that standing at a distance a group of buntings in a patch of weeds makes them practically unnoticeable. Even now as I stood watching them I could not tell but that they were dead weeds against the snow. All this, of course, is for a purpose; it is all done in the name of preservation. Any winged enemy appearing above would be the more unable to locate them. I would imagine that from above, the feathery mask of white touched up with the darker shades practically obliterates them from the sight. At times, even with my trained eyesight, I have failed to see a flock of them until quite upon them when they have startled me by rising suddenly. The snow bunting is strictly a northern bird although I understand that they are found as far south as the Ohio River in the United States. In this northern region they are ever present and I have no doubt but that, along with the tree sparrows, they destroy vast quantities of weed seeds. Such seeds, of course, constitute their principal fare. We may believe that they are unconsciously assigned to the weed-thickets to do their duty while the other winter birds are busy with the tree trunks routing out the insect life harbored therein.

Not all the sunflower seeds on a head are possessed of "meats" within them, but I had not paid attention to that point until this morning when I was engaged in the pleasant task of watching the chickadees and nuthatches feeding from my offerings in the seed box. A rather nervous nuthatch has put in his appearance and from his actions I am given to believe that he thinks I have a stone handy with which to lay him out. He has studied me from every vantage point and angle. He has watched me when standing on his head and resting on his side. If he should turn his eyes for a second he at once wheels around as though by so doing he will catch me off my guard, betraying the stone he no doubt believes I have hidden in the palm of my hand, though otherwise there is nothing to prove that such is the case. I am confidently of the belief that he at first thought the seed box some new species of infernal trap which would jump up and squeeze him thin as paper, but seeing so many birds automatically going in and coming out of this lunch room with every appearance of animation he finally mustered up courage and entered, but no sooner had his tail feathers disappeared within than in the thousandth part of a second he had wheeled and his head was at the opening and he was critically looking me over from head to foot. Finally he went in out of view and I knew he was looking over the food situation, probably also from every angle. Should I have blown my nose or cracked a stick I am sure that he would have stormed out of that box and would be flying yet, for all I know. I put it down that some lad with a rifle had, not in the very distant past, taken a shot at him and the memory was all too vivid.

The chickadees go into the feed-box, bring out a seed and while at the edge of the box test it by turning it and pressing it between the bill several times. They seem to sense if there is a "meat" within the shells at once, and if not they drop it to the ground and return for another. The whole area under the feed-box is littered with meatless seeds. I have picked up these uncracked ones, giving every evidence of having a meat within the shells but upon cracking it open have found it was empty. Even with my intelligence I could not tell that it was empty, either by its looks or by pressing the hard shells, but must open it with my teeth to discover if I am right or wrong. And yet the bird, turning it around in his bill could tell at once, without opening it, whether or not it had any food value.

Our common sunflower makes a most desirable bird seed, and mixed with the chicken feed is of unsurpassed value. The claim is made that "the chickens lay better" by feeding it to them but as to this I can say little. I have seen stalks four inches in diameter and fifteen feet in height, positively an amazing growth for one season. In that time, too, the head with its seeds had been produced.

Some of these stalks grown in fertile soil yield heads one foot and a half in diameter. In selecting seeds for the coming season only the largest ones on a head should be picked off; thus season after season of selecting from the best produces a superior grade of seed noted for strength and the attainment of height. We are not yet in realization of the immense value of the sunflower, but an acre of such planted in fertile ground and properly spaced and cultivated produces feed for chickens of greater value than the amount of corn taken from an equal area.

(Continued next week)

Lord "Bob"—England's Political Hamlet

By GEORGE F. KEARNEY

ONE of the oddest characters in English politics of the present day is Lord Robert Cecil. It came as a surprise to the world that he appeared on the floor of the assembly of the League of Nations as a representative of South Africa rather than his own country. Yet, this is but one curious phase of his interesting political career and it lends to his character just that touch of a prophet who, having drafted the League's covenant, finds himself, without honor in his own country.

Lord "Bob" is the outstanding figure in the House of Parliament. He is the one man whose speeches can attract the members, and their wives, from the proverbial tea on the terrace. The men in the press gallery report his speeches in full and they are read as closely by the laboring man as by the English squire of the old order. A Conservative in politics he is the most constructive liberal thinker in all England while the Labor journals give him the most respectful attention. Many consider him the logical successor of Lloyd George and there are a few enthusiasts who herald him as the prophet who will bring back peace to a troubled British Empire.

His appearance is as odd as his career. Were he an actor he would be cast for the part of Hamlet, so lanky and melancholy is he, and his political story certainly out-Hamlets the tale of the Prince of Denmark. He looks like the familiar caricature of a down-at-the-heel tragedian, yet really much thinner. He is a tall man with drooping shoulders and his clothes hang on his sparse frame in loose folds. He moves around with the awkwardness of a scarecrow and his gestures seem expressive of great weariness of the flesh. His head dominates his body but it bends far forward and the curve of his back describes a complete question mark. He has a great boney face with a heavy jaw but there is a fund of good humor and kindliness in its expression. His eyes belie the laziness of his frame for they flash alternately with humor and zeal. He is a priest type, who in medieval times would have worn sandals, and there is a fanatical cast to his mind, as instanced by his devotion to the ideal of a League of Nations.

His rôle in present-day English politics is particularly interesting to us for it gives us an insight into the real attitude of Great Britain toward the League of Nations. In his attitude toward world politics he is not unlike Woodrow Wilson but there is none of the Wilsonian arrogance. Instead, Lord Robert is a diffident man, slow in speech, and unoratorical. His English is more direct and devoid of phrase making. He believes that the hope of the world lies in an effective League of Nations and he is regarded as England's greatest champion and apologist of the present covenant. As such he has become a consistent critic of the Coalition Government's present policy toward the League and he has gradually revealed Mr. Lloyd George's true attitude toward the covenant.

Lloyd George has grown to regard Lord Robert as his great critic in Parliament. During the Peace Conference at Paris, Lloyd George found him a useful but a troublesome member of the British Mission. Lord Robert is credited with having convinced President Wilson of the impracticality of the principle of the freedom of the seas. It was to Lord Robert that Mr. Wilson handed over the task of heading the commission that drafted the Covenant of the League of Nations when our President grew weary of his long wrangle with Leon Bourgeois, the French representative, on the subject of an international army. By a sudden *coup de théâtre* on February 13, 1918, Lord Robert deftly brought the matter to vote, defeated the Bourgeois proposal, and gave Mr. Wilson his precious covenant to take back to America on the next day. As the Peace Conference proceeded, Lloyd George is said to have resented the growing friendship between President Wilson and Lord Robert. Clemenceau fumed over it because any alliance of these two would have strengthened Mr. Wilson's hand. Lord Robert is the one political idealist who knows his Europe thoroughly. Lloyd George found lesser tasks for Lord Robert to do as the Conference proceeded.

Lord Robert Cecil made a speech in Parliament in which he declared that "there is not room in Europe for two international bodies such as the Supreme Council and the League of Nations." Automatically Lord Robert has voiced his disapproval of Lloyd George's disregard of the League of Nations. Although Lord Robert is the bitterest critic of the Covenant of the League of Nations as it stands he still remains the strongest English exponent of the League, believing it, as he does, to be the only solution out of Europe's difficulties. He differs with Lloyd George fundamentally on the underlying practicality of a league, for in the storm and stress of nowadays the British prime minister seems to have lost faith in any sort of a league of nations.

Naturally, then, Lloyd George was not anxious to have England represented at the assembly of the League by a man who disagreed so sharply with his League policy. Lord Robert representing England, dominated by a Coalition Government that has little use for a vital League of Nations, would have been an anomaly. Yet this post of England's chief representative at the assembly obviously belonged to the man who wrote the covenant and who followed its progress through the Peace Conference at Paris. Had the British prime minister believed that the League was feasible Lord Robert, the practical enthusiast, would have been the logical representative.

Lloyd George first asked Viscount Grey to take the position and he refused. Lord Grey is a great friend of Lord Robert Cecil and his declination was considered, in England, as an appropriate protest against the prime minister's slight to Lord Robert. The situation became rather tense and no one cared to take up the post. Even until the last moment it was thought that one place in the British delegation would be reserved for Lord Robert. Then General Smuts, of South Africa, threw down the gauntlet and secured the appointment of Lord Robert as a delegate, by courtesy, from South Africa. General Smuts is recognized as one of the clearest political thinkers of the Empire and he is well known as a critic of the confusing policies of the present prime minister. He will be remembered as one of the original advocates of a league of nations and the man who registered, on signing the Versailles Treaty, a solemn protest against the harsh terms imposed on the enemy.

There has lately appeared in England a pamphlet by Lord Robert Cecil entitled, "The New Outlook," in which we are privileged to sense the general trend of his thinking. This is a time of great disillusionment in England, when men openly guffaw at the idea of a new era coming out of the war. Men who formerly spoke with enthusiasm of our war aims have revised their observations of world politics to suit a new cynical mood. Politically England is on the grab and the little Welsh prime minister retains his position by reason of his supreme ability to get what he goes after. As an antidote for this nearly impenetrable mood of disappointment and irritation Lord Robert Cecil and a small group of his friends are today trying to revive the latent idealism of the British people that they may pass through this valley of the shadow with some degree of faith in the future. As a man who holds on to his faith in the future Lord Robert Cecil runs counter-current to the trend of present-day thinking in England.

LORD ROBERT CECIL

For England's political Hamlet the "times are out of joint." Ordinarily, with the nerves of the English people less jaded, his type of calm, intellectual, thoroughly British leadership would receive its full recognition in English public life. But these are the days when a little Welsh "foreigner" is at the helm and the English people suffer frightfully from a lack of Home Rule for England. Apparently all that Lord Robert Cecil can do, in this present mood of English political life, is to move around cursing the spite that forced him to be born to set the world aright. Lord Robert comes of the great Cecil family with a long tradition of political service and it is inevitable that each generation of the Cecils shall function just a little bit ahead of its time. Lord Robert feels that the day of England as a great empire builder, in the old sense of the word, is over. He has caught the newer political vision that transcends the old idea of an empire as a nation with a flag upon which the sun never sets. His family have been, through many generations, the builders of that empire and yet the strongest critics of the system of exploitation that has marred the service that the British Empire has rendered to civilization. When Lord Robert dreams of a newer empire it is the Empire of a World with a Parliament of Man. Naturally in view of the present state of the world's mind, with nationalistic ambitions running rampant throughout all Europe and Asia, coupled with the overwhelming defeat of Woodrow Wilson at the Peace Conference and his subsequent defeat at the hands of his own people, the pleas of Lord Robert for an effective League of Nations is cynically received. Yet the old British Empire crumbles before the eyes of the English people as Egypt, then Ireland, next India forcibly retires, while the dominions show an independence undreamed of in the nineteenth century. It crumbles because there has passed a vision, and without a vision these ideal-loving English people perish as a dominating nation.

We have all reached that stage in the development of civilization where it is more practical to co-operate on a friendly basis with the world about us than to dominate by right of superior arms. The circle of enlightenment has swung to the dark corners of the world and it is no longer possible, or necessary, for the old order of empire builders to carry on trade with an army of occupation at their backs. It is much more practical, as England is gradually learning in Mesopotamia, to remove the army and trade with the native as man to man, for then he shows a new pride in his production.

Lord Robert Cecil, son of empire builders, is now England's keenest critic of the old order. He has what he calls "a burning passion" for a league of nations that will give us a new outlook on life. "We have become more and more convinced," he says, "that existing international relations were based on a fallacy. They proceeded on the assumption that every nation was the potential enemy of every other nation. Hence came the whole paraphernalia of the old diplomacy—competitive armaments, secret understandings, alliances, balance of power, and all the rest of it. But as a matter of fact, the common interests of the nations of the world are nowadays far larger and more important than national antagonisms."

He is outspoken in his criticism of the present British policy toward the League. "I would only say that if we really believe the plan is worth a trial—and remember no other solution of our international difficulties has been ever proposed except a return to the old international anarchy—if, in the popular phrase, we mean business, it is not enough to have subscribed to the document, we must carry it out in spirit as well as in letter. Our whole foreign policy must be based on the League of Nations. We must regard the misfortunes of other nations as a matter of national concern to ourselves. If foreign babies are starving for the want of milk, we must go to their assistance diplomatically as well as pecuniarily. If we make an agreement with a semi-civilized country to help it in putting its affairs in order, we must be ready to submit the convention to the approval of our fellow nations. Until a general arrangement for the limitations of armaments has been arrived at we should seek to regulate our naval and military policy in consultation with other governments. Nor should we stop here. It is at least a question whether the principles of the League of Nations may not be extended further, and whether the only hope of averting the threatened class war is by modifying the spirit of class competition by that of class co-operation."

Lord Robert's bill of indictment of the present Coalition Government can be summarized briefly. He feels that Mr. Lloyd George has offered no constructive labor program to allay the unrest that has crippled British industry. Lord Robert has said, "It is a delusion to suppose that class antagonism really depends upon private profit. It really arises from the separation of the employing and employed classes producing in the minds of each the impression that their interests are divergent." He sees in the state management of industry merely a suppression of private employers and the transference to government departments of the complete direction of industry.

He has been bitter in his criticism of the government's present policy in Ireland. "I would suggest that we offer to the people of Ireland the same kind of constitution as our dominions at present possess; that is to say, complete freedom of self-government, provided the control of foreign affairs and armaments remains in imperial hands. Those portions of Ireland which accepted this proposal would cease to be represented in the British Parliament. If, in the future, as is much to be hoped, some new organization of the Empire is established, Dominion Ireland would naturally have its share in that organization if it wished. It would be clearly understood that this scheme would not be applied in any district in Ireland, such as Northeast Ulster, where the majority of the population were against it. There would necessarily have to be subsidiary provisions on finance, but on these points it would be best to adopt a generous attitude. As an alternative, a federal constitution, with a separate treatment for Northeast Ulster, might be offered, and a referendum should be then taken to ascertain which of the people desired either of these alternatives and which preferred to remain in the union as at present existing."

There has recently appeared in England a little volume, published anonymously, called "The Mirrors of Downing Street," in which a number of the leading figures of English political life are discussed by one who knows them very intimately. In the little study of Lord Robert Cecil the writer bewails the fact that this one constructive thinker in all the England of today has not risen to take a more active part in the reconstruction of the moral conscience of Great Britain. Instead, the lanky figure of Lord Robert rises in Parliament, not in a fighting mood, but with that weariness of the flesh that comes when a man broods too much over the ills of the universe.

He has come nearest to being the prophet at Geneva where, without honor in his own country, he sits brooding over the fate of his great life dream, the League of Nations. There are many people in England who see in Lord Robert the prime minister who will lead them out of their political confusion.

The Small Community Learns to Play

By O. F. LEWIS

IN THE lonely forests of the northern peninsula of Michigan there is a diminutive settlement having perhaps not more than thirty houses. They are practically all one-story affairs, covered with tar paper, primitive, but just as much homes of people, men, women, and children, with human needs and longings, as though they dwelt in the big industrial centers. Indeed, their craving for amusements and recreation is greater, for it is rare indeed that any of even the most customary recreations of the outside world seep through to this village.

Now Michigan has a state commission devoted to the extension of community organization, which means especially the development of ways of using the leisure time—the spare time—in people's lives so that value and enjoyment will come out of it. And into the little settlement came recently a man called a "community organizer," representing the Community Service movement. His work was to tell ways and methods whereby the community could itself organize its forces, strong in desire but weak in knowledge, to obtain some simple forms of amusement and recreation.

The brief story of how Strong, Michigan, organized itself is worth a ream of paper used for theories as to what might be good for Strong, Michigan. So, after the man from outside had gone, a community council was organized by the residents of the thirty or so houses and homes, and under the leadership of two local, energetic men who saw what value there would be in the coming-in of some games and recreations and enjoyments that would knit the little community together on the play side of life. This Community Council secured an appropriation of $1,200 from township funds for recreation in the township. We must note, in this connection, that this was *not* a benefaction from some wealthy philanthropist or foundation, but was the hard-earned money of the taxpayers, obtained by local effort for local use—and *for having a good time* by all the community.

They ordered a simple equipment of playground implements, called the "Wonder Kit." What was in the "Kit"? It sounds rather humorous for grown-ups to be so excited about it all, but here were some of the things, bought for less than fifty dollars:

One basketball	One set basketball goals
One volley ball	One volley ball net
One playground ball	Two bats
One set quoits with pins	One medicine ball
One pump	One repair kit

The repair kit contained needles, thread, wax, patching rubber, cement, rawhide laces, and so on.

What man on the farm hasn't pitched horseshoes—and doesn't want to pitch them again? What child, in the remotest regions, hasn't seen at least a picture of a basketball game? Who is there, on the other hand, who hasn't ever seen a game of indoor baseball, played with a big ball and a short bat, and with bases close at hand, and as much full as at the polo grounds? And all this equipment is packed tightly into a small box no bigger than a steamer trunk.

In Marquette County, Michigan, Community Service was organized by one of the national workers. But the community itself raised a budget of about $10,000 to finance the projects that the community had decided upon. Three workers were hired, two of them from local people and one who had formerly been in the Community Service elsewhere. The local people called soon upon a specialist in pageantry, attached to Community Service, Incorporated, who came to Marquette County and assisted in developing a pageant which had been written by a local man connected with the local historical society. Then the man from outside left, and the pageant was put on without further help, and entirely by the effort of local talent. It was a county affair and the people who took part came from all parts of the county. There were about fifteen hundred people in the pageant, and there were perhaps ten times as many looking on. And everyone enjoyed a home production.

In Michigamme a similar pageant has been recently given. In Ironwood, Michigan, the people have voted a bonding proposition for a $300,000 community house. In Lowell, which is a community about twenty-five miles from Grand Rapids, the mothers in the village were interested in a summer playground, but there was no money available for hired leaders in the playground activities. One of the state recreation leaders went into the village occasionally, and conducted for a while some training classes in play for the mothers, teaching them the value of supervised play, and games which could be used on the playgrounds. With such instruction the mothers of Lowell supervised for the entire summer a playground for the children of Lowell.

Community singing is one of the most noteworthy developments of the last few years in social lines throughout the country. Song leaders have found their work becoming a profession, and so Community Service, Incorporated, has upon its staff a number of song leaders who so lead the people in singing the old familiar songs, the popular songs of the day, and also special patriotic songs, that before a group knows what is happening, everyone is singing lustily. It is the "old singing school days" in a new form.

Community Service, Incorporated, with its national offices at 1 Madison avenue, New York City, is an outgrowth of the war, and of the Playground and Recreation Association of America. What it has helped to bring about in Michigan and other states, it is ready to help to do elsewhere. It is peculiarly in a situation to help by advice and counsel, pamphlets, correspondence, and actual visits of specialists, those communities which want to make themselves better places in which to live.

Clinton County's Santa Claus

By E. B. CHAPMAN

MOTHER had been too busy to wash his neck and ears. That was evident as he walked into the First National Bank, at Plattsburg, Missouri, and sought the tallest man in the group that stood talking over losses on the cattle market. The newcomer was about 9 years old. He touched R. A. Shaver, six feet six, on the hand and the two walked aside.

"I ain't missed school a day this year," the boy said. Then out of his pocket came a small paper sack and a generous portion of cheap candy was poured into the giant's hand.

"That's fine," Shaver responded munching the candy. "But you haven't much time now or you'll be late. Thanks for the candy. I'll see you again."

And the youngster was off on the run.

What manner of truancy officer is this, that children divide their candy with? He isn't a truancy officer. He's Clinton County's Santa Claus. And since he began operations there is no need for a truancy officer. Children cry to go to school. A boy would fight rather than be absent between Thanksgiving and Christmas.

On some one of those twenty school days Santa Claus's truck visits every school in the county with a present for every child in school. The only way a child may get a present is by attending school. He must be in school the day the truck comes. There are no follow-ups except in case absence is due to sickness.

The presents are selected with a view of finding gifts which will suit. They are bought wholesale at the price of $2 each. This year the gifts retailed at $5. Sixty schools are visited and 2,000 pupils given presents. There are dolls for the girls, splendid, strong knives for the boys. There are mechanical toys and musical instruments. It is attempted to find gifts that will please the individual as far as it can be done.

"Santa Claus" usually speaks briefly at the schools after the distribution. Boys and girls are urged to be true men and women, to obey those over them and to be loyal Americans. Each is urged to try to make Christmas happier for someone.

"I'm selfish in doing it," this unusual Santa Claus told a visitor. "I get a great deal of pleasure out of seeing children happy. So I'm really spending money to get happiness for myself. I realize it brings happiness to the kids. That makes me happy."

This Christmas was the fourth county-wide distribution. Before that time it was limited to the school children in a Negro settlement at Plattsburg. That work was used as a foundation for the county-wide system and Mr. Shaver hopes to continue his annual gifts as long as he lives.

It is two score years back to the beginning of the story. A boy and his grandfather were driving. On the sidewalk hobbled a second boy. A "stone bruise" on his foot made the going painful and slow.

"Call that boy over here," the grandfather said. "I want to give him a dime." The limping lad was called. Given the money his eyes went wide with astonishment. Then away he dashed, the pain forgotten in his joy.

The grandfather smiled at his more or less puzzled youthful companion.

"How happy a dime makes a youngster," he said. Thoughtful a moment he added:

"I abhor waste and reckless expenditure. But sometimes I wonder if those of us who prosper are not impressing the lessons of thrift too strongly upon our children."

"That incident always has remained with me," Mr. Shaver said. "Even in the days of wanton spending we have had lately I have wondered if some persons were not denying themselves a full measure of happiness as a result of their lessons in thrift."

Years passed and the lad who had ridden with his grandfather became a man. Later came illness. It tortured him. Unable to rest lying or sitting, he found relief in riding, slowly, on horseback. Rides took him to all sections of the county. He saw despair that touched his heart. The rich farming community, famed the state over for its wealth, had some canker spots of poverty. The situation in the Negro settlement especially impressed him. Meanwhile his health grew worse. Physicians afforded no relief.

The time came when the lanky horseman decided the end could not be far away. He gave up doctoring and attempted to resign himself to what seemed inevitable. Then it came to him with a shock that he had unconsciously planned to do something to relieve the distress he had seen. Death was about to prevent the carrying out of that plan.

"I promised myself and my Creator that if I could recover my health and prosper I would do something to make others happy," he said. "I made up my mind that if fortune favored me I would devote my income, after I was 40, to making others happy. In a month I was well.

R. A. SHAVER

"I have fudged some on my proposition. I didn't get going good until I was 45. Since that time I've been doing better. I never felt better or was happier."

Another Christmas measure of Mr. Shaver's is a $5 gift, in cash, to helpless old Negroes in the settlement. The list is made up for him by members of the settlement. Each case is investigated thoroughly before the name is turned in. That is done by members of the community. All Mr. Shaver does is furnish the money. But infinite care is taken by the investigators that Mr. Shaver is not imposed on. It is significant there are few men on the list.

Several years ago Mr. Shaver decided to seek young men who seemed capable of success, that he might encourage them. He decided the accumulation of $30,000 by the time they were 30 would be the test. If such men were found, a syndicate, tentatively formed, would finance them on a larger scale.

A search that covered every nook in the county disclosed two such men. One is Mr. Shaver's partner now. The other was so busy with the projects under way that he had no opportunity to undertake others.

"I wish to see a successful man develop from a poor boy in every community," he said. "I want there to be a man in every neighborhood to whom a father can point and tell his son 'that man was as poor as you. He has made a success. If it is in you, you can do as well.'

"Such examples mean much to boys. It is almost impossible for them to develop successfully without the examples. We become so interested in hogs and cattle and acres I'm afraid we sometimes forget the importance of children," the Plattsburg Santa Claus said.

Most men believed in Christianity, he believed. The trouble was not enough of them worked at it. Working at Christianity didn't mean preaching. On the contrary it meant practical demonstrations of a belief in the teaching of the Nazarene.

"If Christianity teaches anything it teaches making others happy," he said. "If we stop at spending money to carry out our teachings it seems to me the worship of money, rather than the principles of our Teacher, controls our lives. So I find genuine pleasure in acting in accordance with my belief. I find no fault with the man who acts contrary to that belief. But I pity him because of the happiness he is missing."

Some Wonderful Fibs of Bygone Years

The famous Damascus blades that were fabled to cut iron bars in two were not superior to the Toledo blades of the present time.

Seneca was not a half-Christian philosopher, but a grasping money-lender, and died leaving a fortune equivalent to $3,000,000.

Charles IX did not fire upon the Huguenots with a harquebus from the window of the Louvre during the massacre of St. Bartholomew.

The Maelstrom is not a whirlpool which sucks ships down into the depths of the ocean. It is an eddy, which in fair weather can be crossed in safety by any vessel.

Horatius never defended the bridge. It was a story manufactured by the same Roman historian who put forth that other fabrication of history that Micius Scaevola put his hand in the fire.

Pitt never made the celebrated reply to Walpole beginning, "The atrocious crime of being a young man." It was composed by Dr. Johnson, who was not even present when the actual reply was spoken.

Alfred the Great did not visit the Danish camp disguised as a minstrel. There is excellent authority for asserting that he could neither play the harp nor speak Danish. He did not let the cakes burn, either, as history records.

The Hanging Gardens of Babylon did not hang and they were not gardens. They were terraces supported by arches and overgrown with trees. They were erected for the amusement of a Babylonian queen who had come from a mountainous country.

Pocahontas, the Indian princess, did not save the life of Captain John Smith by standing between him and a club held by her father or by any other method. It is now considered but a romantic yarn spun by Captain Smith's imagination and perpetuated by the historians.

Hannibal did not send three bushels of gold rings taken from the hands of the Roman knights killed on the field of Cannae back to Carthage as evidence of his victory. The fact was as follows: The messenger who carried to the Carthaginian Senate the news, on finishing his report, "opened his robe and threw out a number of gold rings gathered on the field."

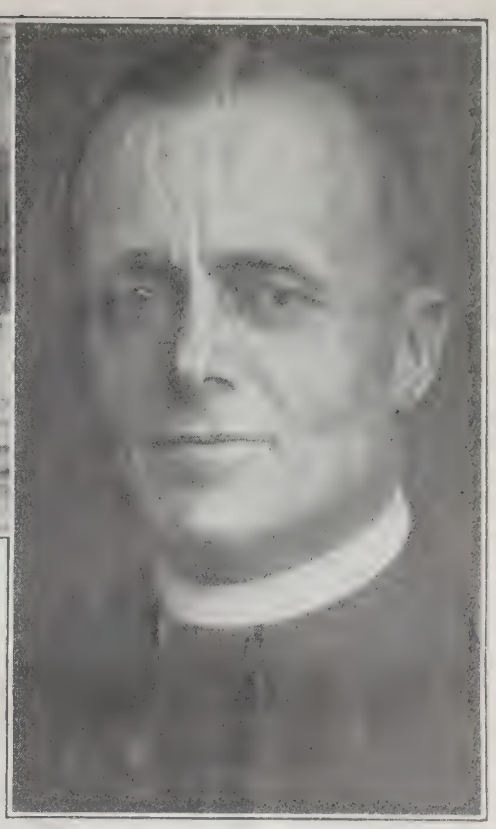
REPRESENTATIVE H. W. TEMPLE,



Of Pennsylvania, is a believer in the Lord's Day Alliance, and will probably use his power in the House to compel the return of the Puritanical Sunday.

(C) U. & U.

HARRY L. BOWLBY

Leader of the so-called Blue Sunday Crusade, which has begun to enforce legislation that would bring us back to the Puritanical laws of hundreds of years ago.

(C) U. & U.

REV. DR. WILLIAM T. MANNING

Rector of the famous Trinity Church, who has aligned himself against Dr. Bowlby of the Lord's Day Alliance, and is in favor of a modern Sunday, in which religion and recreation are combined.

The Sunday Blues

By C. COURTENAY SAVAGE

THEY were to be married the following week, and, as was his custom, he walked across the fields toward her house that Sunday morning, to accompany her to church. She met him halfway. There was no house close by, no one in sight. The birds sang lustily on the branches of the trees and bushes; flowers bloomed at their feet. And he kissed her!

"Oh, don't!" she sighed, "Someone might see you."

"There's no one around," he laughed, and kissed her again.

But there was someone around—from his crouched position back of a stunted tree up jumped the town constable. He laughed in true villainous style, and he pounced on the young man with all the vigor of the law.

"Verily, I have caught thee," he scowled. "The stocks for the day shall be your punishment. And you, wanton girl, go pray forgiveness." So, instead of going to church together, the girl went sadly alone, disgraced, while the young man spent the day with his feet in the stocks—a very uncomfortable day, for he knew that his family would never entirely forgive his action.

A foolish little story? An echo from the sterner days of long ago? Yes, but if the band of men and women who have suddenly risen in this country and proclaimed that we are once again to have the Sabbath Day blue laws are successful in their plan we are going to be subjected to punishments just as strict in comparison as was the punishment meted out to the Puritan lad for kissing the lady he loved.

The blue laws that have so recently stirred our nation are a revival of an old subject, and many times the people of various communities have fought for and against the Puritanical Sunday. Just what constitutes a proper observance of the Sabbath Day has, from time out of mind, been a fruitful cause of controversy and strife, and, as a result of the frequent agitations over Sunday observance, many blue laws have, from time to time, been resuscitated with deadly effects, and many new ones enacted.

To Connecticut belongs the honor of being the home and originating point, in our country, of the blue laws. These were contained in what is known as the New Haven Statutes, framed from the strictest English and Scotch models.

The casual student of history is more or less familiar with these old Puritan Sunday laws. A man, for example, was forbidden to kiss his wife on the Lord's Day, nor could a woman kiss her child; he could not shave himself; run, or even saunter about in his own garden; no work could be done, even the cooking of the Sunday meals had to be performed on Saturday. The Puritan Sunday was a day of almost continuous religious exercises, reverent behavior and sober conduct.

The punishment meted out to the violators of the sundry Sunday laws was severe—flogging, the stocks, imprisonment, fine, and so on.

In course of time as our country grew in size and population most of these blue laws became obsolete. From time to time they cropped out in a locality where someone was willing to undertake a reform movement. Often the passage of the laws was enforced. For instance, in New Orleans there is a law against Sunday tobacco selling. Not that you cannot buy tobacco on that day, for you can. Cigar stores and stands are camouflaged by curtains, behind which tobacco-selling goes on "as usual." In Alabama, tennis and golf are taboo on Sunday. In Baltimore, less than six months ago, Sunday arrests on one day included druggists, barbers, ice wagon drivers, bakers, and so on. Selling candy to a child and keeping books were classed as heinous offenses, and a man who was painting his gate also had a free ride to the police station. Men smoking cigars had to give an account of themselves and disclose where they got them. Sunday golf is forbidden in some parts of Massachusetts.... In Tennessee the cigaret fiend may not buy on Sunday in Nashville, but may in Memphis. In New York City, before prohibition, Sunday liquor-selling was banned, except to the "traveler" in hotels.

And now today, as in olden times, a group of citizens of the United States has become suddenly appalled at the wickedness of our nation. A great reform wave is gathering head to make the world better. And the first action of the new Puritans is a plan to return to the Puritan Sunday, and we find ourselves in the midst of a great discussion, pro and con.

The Rev. Dr. Bowlby, general director of the Lord's Day Alliance, the organization responsible for the revival of the blue laws, in explaining its campaign, said:

"Our object is to defend and preserve the Lord's Day as a day of rest and worship, and to enunciate and urge one day of rest in seven for all the toiling masses."

His program has been taken by many to mean the end of all Sunday amusements and recreation—golf, motoring, bathing, movies and ball games. His plans, say those who oppose him, would close all stores; forbid telephoning, and riding on trolleys or trains except in cases of absolute necessity. But people may walk in the fields, parks and visit the museums.

Naturally, there are a number of men and women objecting to the views credited Dr. Bowlby. Opposing the return to the Puritanical Sunday is the Reverend Dr. Manning, of New York's famous old Trinity Church.

In Dr. Manning's opinion Sunday is one of the foundations, not only of religion, but of civilized life itself.

"The principle of one day in seven set apart for rest has been one of the great factors in human progress," said Dr. Manning, "for a Christian the principle is that Sunday is to be observed as the Lord's Day, and therefore worship must have its proper place. No Christian can consistently or with loyalty neglect worship on the Lord's Day. The Christian is to come near to God on this day so that he may keep near to Him on all days.

"But this does not in the least conflict with indulgence in wholesome and innocent recreation and pleasure on Sunday. The Lord's Day ought to be the happiest day of the week, not the dullest and the least to be looked forward to."

Dr. Manning's objections to the methods of the Lord's Day Alliance are twofold:

"First, such a method would be an unwarranted invasion of proper individual liberty. We have no right by law to attempt to compel the observance of particular religious customs. It is right for the law to restrain needless business on Sunday so as to secure Sunday as a day of rest for all. As far as possible the law should give to all a day of freedom from ordinary occupations, a day which they may devote to religious observance if they so desire. Further than this the law may not rightly go.

"Second, I object to any revival of the Puritan Sabbath, in the interest of Sunday observance and in the very name of religion itself. A great deal of the present day laxity is a reaction against the exaggerated severity of those times. The Puritan idea of Sunday was always a mistaken one, and it never represented a consensus of the opinion of the church. It never represented more than the peculiar views of a relatively small class of Christians. There is not a word in the New Testament which supports such an idea of the Sabbath. On the contrary, our Lord rebuked the Puritans of His day and told them that the Sabbath was made for man, and not man for the Sabbath."

In conclusion Dr. Manning considers that the Puritan idea of Sunday has done untold harm to religion, and its revival would be an unmeasured calamity. It gives a wrong idea of religion. It pictures religion as something out of accord with the joy and happiness of life. We need today the message, "Behold I bring to you good tidings of great joy." In contrast, the whole idea of the Puritan Sabbath puts emphasis on restrictions and restraint rather than on the principle of the guidance of the spirit.

At one with the Episcopal clergyman is the famous Presbyterian divine, Reverend Wallace Gallup, who says:

"To my mind there is not the slightest desirability of a return to the Puritan standards in anything. It is just as absurd to wish to return to those standards in morals as it would be in fashion of clothing. I have much pity for those individuals who are so ignorant and fanatical as to seek to impose seventeenth century standards upon the twentieth century communities, and it is deplorable to me as a minister to see leading members of the clergy of many denominations lending their aid, officially and privately, to just such a campaign.

"Those who wish to make our legal Sunday a long-faced day of pious looks and morbid inactivity have a perfect right to do so, it is their privilege. But such a day cannot be imposed upon the nation, the larger majority of which has no desire for such a day. No man

(Concluded on page 14)

If the Sunday Blues come, people may walk in the fields but they may not play golf.

Canada's First, Greatest Author

By JOHN B. WALLACE

SIR GILBERT PARKER

MANY honors have come to Sir Gilbert Parker during his long and useful career but the one of which he is most proud is the distinction of having been the man who put Canada on the literary map. Before he, then an unknown youth, appeared in London with a bulky roll of manuscript under his arm, some time during the late eighties, the great northern province of Great Britain was a closed book to the realm of fiction. No native authors had appeared and such outsiders as had written of it had touched it but incidentally and sketchily. Since then Canada has produced two other authors who perhaps deserve to be ranked with Parker, namely, Basil King and Ralph Connor, besides a number of lesser lights. But Parker was the pioneer in this great undeveloped field. And like most pioneers, his own country was the last to recognize his genius.

Sir Gilbert Parker is a rather compactly built man of medium height. His beard and hair are shot with gray. His whole personality radiates kindliness and sincerity. His manner is entirely frank and unaffected. He either says what he thinks or he says nothing. He is the kind of a man whom a child would instinctively call grandpa.

I do not wish to convey the impression that he is senile; on the contrary, he is a man of vigor, both physically and intellectually.

Like all big men Sir Gilbert has his foibles. For instance, he complained rather plaintively because he was not given his full title of Right Honorable in this country. For his services during the World War, Sir Gilbert was made a privy councillor and a baronet by the British Crown. He had been previously knighted in recognition of his literary genius.

It seemed strange to me that a man who had written "The Right of Way" and "The Seats of the Mighty" should worry about a trivial matter of title, especially as the average citizen of the United States would not know what the title privy councillor meant. In fact, I'll confess I didn't know myself until I looked it up.

Perhaps something of this appeared in my face because Sir Gilbert explained to me that honors of such sort were given in England as rewards of merit and were valued as highly as our soldiers would value a distinguished service cross.

"For instance, men like the Honorable Cabot Lodge would be highly insulted in England if we left off the Honorable," he said. "Your Senators and other public men are most punctilious about such matters when abroad."

I have found Britons from the provinces, especially those in whom the title was not hereditary but had been conferred because of services to the Crown, to be much more sensitive about titles than English-born lords of ancient lineage who for the most part seem to consider their dignities to be more or less of a bore.

Sir Gilbert Parker was born in a small town in Ontario, Canada. Both his father and his grandfather were soldiers and officers in the British Army. His grandmother was a native of Ireland.

"I am very proud of my Irish blood," he told me. "Whatever of imagination I have, I owe to it. The Irish brogue always came natural to me, even as a boy. The Irish verses in my books are my own."

Sir Gilbert developed a taste for books and writing when but a young boy.

"It seems as if I have always written," he said.

When he was twenty-two he went to Australia, landing there with but $150 and owing $2,000 to a relative. Today he is several times a millionaire and all of his fortune has come from his books.

He had been in Australia less than a year when he was made associate editor of the Sydney *Morning Herald*. He had no intention of staying in Australia, being in fact on his way to England. A series of articles which he had written about the country during a trip through New South Wales and Southern Australia had so interested Sir James Fairfax, the owner of the *Herald*, that he urged him to stay and remain on the staff of the paper.

"I wanted above all to travel," Sir Gilbert explained to me, "so I put up a bluff, as you Americans say. I told him that I would stay if he would allow me to travel for three months every year at the paper's expense. I never expected him to agree but he did. I remained in Australia three and one-half years visiting Samoa, Tonga, the South Sea Islands and covering the greater part of Australia and Tasmania."

During his connection with the paper George Rignold, the famous Australian actor, opened a new theater with "Henry the Fifth." Throughout the performance the gallery made such a noise that Rignold stopped the play and made a plea for silence.

To his surprise, a voice from the gallery shouted, "So help me God, George, we can't see you."

It developed that in building the theater, the architect had cut off a view of the stage from more than half the gallery.

Sir Gilbert's account of this incident and his review of the play caused Rignold to send for him and the result was that he was commissioned to write three plays. Two of these were highly successful, the other was a failure.

When Parker finally arrived in England he carried with him a bag containing the manuscript of twenty-two short stories. He asked Archibald Forbes, the war correspondent and himself a writer of note, to read them and give him a candid opinion as to their merit.

"Forbes asked me out to lunch a few days later," Sir Gilbert said. "He said nothing about the stories during the meal but afterward when we were walking down the street he put his hand on my shoulder and said, 'Parker, that is the best collection of titles I have ever seen.' I understood. That night I went home and burned them all. I saw that I had not yet learned my trade."

Parker had written a book of travel called "Round the Compass" that had not been altogether unsuccessful but he still clung to the idea that he could write fiction. One day as he was walking down the Strand he saw in a window a trapper's outfit. It carried his mind back to his boyhood home in Canada. He went to his lodgings that evening and started on a collection of short stories called "Pretty Pierre." These were successful from the start. In 1895 he wrote "The Seats of the Mighty" and in 1901 came his greatest success, "The Right of Way." One million copies of this book have been sold in the United States alone.

In 1902 he was knighted in honor of his literary fame.

"The United States has always been the largest purchaser of my books," he said. "It has a much larger reading public than England. I would have starved to death if I had depended upon Canada to purchase my books. It was the last to recognize me. Since then, however, it has been a constant and devoted customer."

Sir Gilbert had a narrow escape from losing the copyright of the first book to be published in the United States. When he landed at New York he had only two days to get a copy printed before the time limit expired. He had known Thomas Nelson Page when the latter was ambassador to England and he immediately sought his advice upon landing. Page gave him a card to a certain publishing house. The publisher threw up his hands and cried "impossible" when Sir Gilbert made known his desire. The card from Page altered matters, however, and within thirty-six hours the book was printed and bound.

Archibald Clavering Gunter, known as a writer of what was then termed yellow back novels—a term which implied a trashy character—had just established a publishing house of his own and he bid for Parker's first novel. Sir Gilbert sought Page's advice.

"It doesn't matter who publishes it," Page told him. "If the book has merit it will sell." Parker found this to be true as he had instantaneous and phenomenal success.

During the World War, Sir Gilbert was director of American publicity and among his duties was the task of reading some eighty American newspapers a day. Notwithstanding this punishment he is a devoted friend of America and all things American.

In speaking of England renewing the alliance with Japan I asked him in the event of war between the United States and Japan where England would stand.

"In the first place there will be no war," he said earnestly. "Japan is too shrewd to engage in war with a country of the proved power of the United States. But should such a thing come you will find England's fleet patrolling the Pacific with that of the United States. England wants a yellow race on the American continents no more than does the United States."

Changing the subject from politics, I asked Sir Gilbert whom he considered the greatest living American author.

He held up his hand. "No, you don't," he countered. "If you want me to tell you whom I consider the greatest dead American authors I will do so."

So I compromised.

He named Mark Twain, W. D. Howells and Henry James of the modern schools.

"What do you consider of the greater importance in a novel or short story, plot or character?" I asked, knowing that he was writing for the motion pictures where plot and action are the main objects.

"By all means, character," he replied. "No novel can live on plot. Given the character, it will make the plot. My two most successful books, 'The Right of Way,' and 'The Seats of the Mighty,' were built upon the characters of Charley Steele and Doltaire. The latter was a living character. If you will change the D to V you will perceive upon whom it is modeled. As for style that is the writer, himself. No one can successfully imitate style."

The Sunday Blues

Concluded from page 13

nor group of men, under any name or organization, has the right to say what kind of Sunday we must have. It is our American right and privilege to decide that for ourselves. Personally, I do not want the Lord's Day Alliance or any other alliance to dictate to me, through any means whatsoever, as to how I shall spend Sunday. I think I am quite as capable of deciding that as they are; so is every other American citizen, unless I have mistaken faith in my countrymen."

Meantime the crusaders are hard at work at the nation's capital where they are framing drastic legislation which they hope to get enacted.

They are not entirely unpractical or unbusiness-like in their methods at Washington—neither do they boast that they expect to be victorious at once. This is to be their initial drive, and if they are able even to bring about the passage of laws restricting the Sunday amusements of the District of Columbia, they will be quite satisfied. Other reforms will come later. Supporting their organization in the Senate is Senator Jones, of Washington, while in the House, Representative Temple, of Pennsylvania, is the champion of their viewpoint. Eventually, they hope to pass a twentieth amendment to the Constitution, including a code for Sunday and for divorces. Prominent in the movement at Washington is Dr. E. C. Dinwiddie, and Miss Laura B. Church, both noted for their aggressive work with the Anti-Saloon League.

However, the opposition is very strong even at the present, when, unlike the blue law believers, it is absolutely unorganized.

A prominent surgeon laughed at the "one day in seven" laws, and asked what would happen if such laborers as doctors and nurses were to consider such an action!

"Let us go slowly," warns Judge Mitchell May in addressing a grand jury recently, "before enacting antiquated, discarded and unnecessary laws that may bring down upon our heads a feeling of discontent, dissatisfaction and unrest, and which may fan anew the flames of Bolshevism.

"The man who is happy and contented," he continued, "is in a receptive mood for religion. He is most likely to offer thanks in his own way for the great benefits he receives, he is most likely to make a good citizen, for he understands what his government has done for him. Let us enact laws which command respect and let us support those enacted."

The evangelist, Elmer E. Franke, when asked his reaction to Puritanical Sundays, stigmatized blue laws as "the big stick of religious bigotry and intolerance."

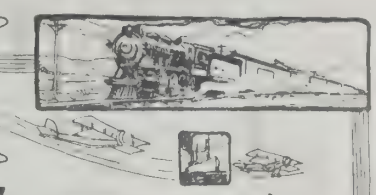
A Unitarian minister, the Reverend Dr. Charles Francis Potter, speaking recently at Columbia University on the "Relapse Into Blue Laws," declared the world had outlived the Ten Commandments and was no longer bound by the taboo of a small tribe in Asia promulgated 3,000 years ago; that no group of men and women should decide how other groups should live on Sunday.

The Reverend Dr. Wilbur F. Crafts, head of the International Reform Bureau, denies emphatically that his organization is supporting the Lord's Day Alliance, as has been represented in the press of the nation.

Massachusetts, judging from the results of the December municipal elections (practically the first elections since these laws have come into general discussion) doesn't want a blue Sunday, for a referendum taken in twenty-one cities generally supports the liberal view of the Sunday question. They want clean, inoffensive Sunday afternoon amusement.

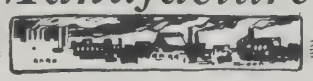
The famous Congregationalist minister, the Reverend Dr. S. Parkes Cadman, believes in a modification of the present Sunday laxity, in regard to commercial amusements, for example, but he does not favor extreme blue laws.

Just what the Sunday blues would mean can be imagined from the pen picture of Sunday in the city of Glasgow, Scotland, where Sabbath Day laws were very rigid some fifty years ago.



"Sunday morning was the most peaceful period of Sabbath Day observances. The window blinds were drawn. No self-respecting family ever allowed the sun to shine in its windows on the Sabbath. The husband, probably sleeping off his liquor of the night before, did not enter into the family life for the time being. The children and women of the household drew long faces and went to church.

"In the afternoon the family would assemble in the house behind the drawn blinds. This was the time when recriminations and family rows were the indoor pastime."



The Three Arts

Agriculture

Transportation

Manufacture

A sharp drop in fertilizer sales in the South is accepted as an indication that the southern farmer is in earnest in his campaign to reduce the cotton acreage next year.

Gas engine specialists of the Department of Agriculture urge those having trouble with engines to follow a definite system in locating the difficulty. Complete information on the systematic study of ignition and fuel systems and the effects of cold weather on motors can be obtained free from the department.

The sum of $1,012,000 has been asked for improvements in New York Harbor.

With the advice and assistance of the National Research Council the Crop Protection Institute has been organized. This is an association for studying insect and plant diseases. Improved methods of fighting the pests of agriculture are to be sought.

Japan is enlisting German skill as a means of saving her war-born industries. It is believed that the combination of German scientific and technical skill and Japanese cheap labor will work to advantage.

California lemon growers are asking Congress to keep out Italian lemons. The western growers claim they cannot compete with the price of the imported fruit.

An American firm in San Salvador, which recently imported a number of American tractors, held a very successful demonstration a short time ago in the presence of the president of the republic and a number of his friends.

More than twenty American steamships are idle because of the condition of ocean transportation. Only a marked revival in foreign trade, it is said, will prevent the withdrawing of many more vessels.

Arkansas passenger rates have been ordered raised to the level prevailing in interstate commerce.

Many southern states report that the Negroes are returning to the plantations. The high wages of the cities drew them from the farming communities during the war.

In an endeavor to assist American firms which desire to export their products to Mexico, the Bureau of Foreign and Domestic Commerce has collected a large amount of trade information which is available to interested manufacturers.

The October consumption of wool, the last month on which figures are available, amounted to 38,510,000 or about 31,000,000 pounds less than for October, 1919.

The total value of automobiles and accessories exported from the United States in 1920 will amount to at least $365,000,000.

A steamship line has been established out of Halifax for Brazilian and other South American ports.

The railroads of the country have been divided into three classes by the Interstate Commerce Commission. Class I includes lines having an annual operating revenue of more than $1,000,000; Class II, lines with a revenue between $100,000 and $1,000,000 and Class III, any carriers having revenues which amount to less than $100,000.

There are almost 2,000 farmers' mutual fire insurance companies in the United States. They carry a total risk of $6,000,000,000 at an average cost of 25 cents per $100 a year.

Kurt Lasswitz, a famous German engineer, claims that by subjecting coal to pressure and heat he has produced a liquid which, mixed with hydrogen gas, gives off far more heat units when burned than does coal. Experiments are being carried out for the purpose of determining whether the liquid fuel can be used successfully by large manufacturing plants.

Thirty-five patents were obtained by the Department of Agriculture. All of the inventions were dedicated to the use of the public.

The Director of the Census has announced the following facts concerning Maine farms: the count shows 48,227 farms, containing 5,425,968 acres of which 1,977,329 acres are improved land. Since 1910 the number of farms has decreased 19.6 and the improved acreage 16.2 per cent. There are 48,214 white farmers of which 43,-630 are native-born.

The former Russian transport Rogday has been purchased by the Pere Marquette Railroad and will be placed in service on the Great Lakes.

Governor Coolidge, vice president-elect, favors the consolidation of all New England railroads in one system.

The Farm Bureau movement is growing very rapidly in Texas. At the present rate of increase, the state organization will have 100,000 members before the end of its first year.

Packages for Mexico, with the exception of motion picture films and newspapers, will not be accepted when their bulk prevents their inclosure in United States post office mail sacks.

The Minnesota Experiment Station reports that there need be no hesitancy in using wheat of the 1920 spring crop which was affected by black stem rust, for seeding purposes. If the wheat is bright in color and the kernels average nearly as heavy as the small plump seed of a normal crop it is considered suitable for seed.

According to F. C. Shenehon, former dean of engineering at the University of Minnesota, the Great Lakes-St. Lawrence tide-water project would mean the saving to farmers of the Northwest of five cents a bushel on all grain shipped to over-sea markets by this route.

The Department of Agriculture has begun work on a census which will show the amount and value of farm equipment purchased during 1920.

The plant breeding division of the agricultural department of the University of Illinois has produced a new wheat, which outyields its ancestor, Turkey Red, by six bushels to the acre on a five-year average.

The Highways

It required a great national catastrophe to awaken the American public to the inadequacy of our transportation facilities and to the fact that we must depend largely upon our highways, in conjunction with motor vehicles, when a sudden expansion in transportation is essential.

Our experiences during the last three years have clearly demonstrated that the failure earlier to inaugurate a sound road improvement program has retarded the effective development of one of our most vital national requirements. The use of the motor vehicle for highway transportation has increased tremendously within a short period. In 1906 only 48,000 motor vehicles were registered in the United States. By 1914 the number had risen to 1,700,000 while the registrations now total nearly 8,000,000 exclusive of motor cycles. The actual vehicle-mile use of our roads, it is estimated, has increased more than 500 per cent in strictly agricultural communities and more than 1,000 per cent near the large centers of population. These figures indicate the extent to which community and short haul transportation will be served by better highways.—Department of Agriculture Report.

Texas led all states in November oil production. It brought in 9,489,000 barrels.

Kansas leads all states in the production of alfalfa. More than one million acres were devoted to alfalfa in Kansas last year. Nebraska was a close second, being only 17,000 acres behind her neighbor.

New Zealand farmers have found co-operative associations to be very successful. Two strong associations do an annual business of $34,000,000 and handle practically everything their members need, from agricultural machinery down to pins and needles.

The price of raw cotton has dropped 60 per cent in the last eight months.

Six hundred thousand topographic maps, showing the altitude of every part of the country, have been sold to the general public by the Geological Survey, Washington. Index sheets giving the list of maps published may be obtained free.

The Department of Agriculture publishes the result of a number of studies on the cost of producing milk. Those interested should ask for Department Bulletin 919, "Unit Requirements for Producing Milk in Western Washington."

Wholesale prices of commodities, says the Department of Labor, were lower in November than any time since the war.

The supreme court of the state of Washington has upheld the award of the state welfare board fixing the minimum wage for women employed in hotels and restaurants at $18 a week. It is said that this is the forerunner of a movement to raise the present average minimum wage of all women workers.

Western growers of sugar beets announced at a recent gathering that they would ask refineries to split profits with them on a 50-50 basis. Unless this is agreed to the growers say they will raise no more beets.

Missouri and Kansas farmers report a serious shortage of live stock. Farmers who have produced large amounts of feed find no market for the feed and have no cattle to consume it.

Poland hopes to be able to export 70,000 metric tons of sugar from its coming crop.

A Northern Michigan farmer reports a crop of 2,700 bushels of potatoes from 12 acres of new land. The land cost him $12.50 an acre and his first crop had a value of $2,160.

The annual report on mines and production in Alaska is under preparation by the Geological Survey. Accurate figures will not be available for four or five months.

Speakers before the meeting of the American Association of State Highway officials argued for limitation of the size and weight of trucks which are allowed to use public roads.

The freight traffic of the New York Central lines in 1920 was greater than that carried by all the railroads of England and France.

At the close of 1920 the United States had a trade balance in its favor of two and three-quarter billion dollars.

The United States Steel Corporation has announced the purchase of one of the largest manganese mines in South America.

Textile workers are preparing to urge a congressional inquiry of the whole textile business.

Information from Mexico is that instead of the 240,000 bale cotton crop which was hoped for, the yield will not run above 70,000 or 80,000 bales.

Kansas has adopted an amendment to its constitution which authorizes the state legislature to issue bonds or otherwise make appropriation for the purchase of land to be resold to farmers on long time. This is being done in the hope that thereby the tenantry of the farm lands will be somewhat lessened.

X-640
UNIV OF ILL LIBRARY
URBANA ILL

Briefly Told

A 500-ton mountain of peach stones was recently thrown upon the New York local fuel market as a substitute for coal. The stones were gathered by patriotic Americans in war time to be used in the manufacture of gas masks. They found a ready market at $1 a ton, and were distributed to the needy.

The annual cost of maintaining troops in Ireland is $250,000,000.

Villa has gathered about him all the old-time bandit and revolutionary elements which were identified with his campaigns. They are all welcomed but he does not tolerate idleness and every man is put to some kind of useful labor upon the hacienda.

Florence, Italy, is known as the "City of Flowers." Here the famous orris-root perfumes are produced from the roots of the large pale purple iris or flag which is grown extensively throughout the surrounding districts.

The employes of a clothing manufacturing company in Cincinnati recently decided voluntarily to surrender their jobs for one month, either January or February, to give employment to those who are out of work in other factories.

As a result of the protest of the German minister to Cuba the motion picture film portraying the execution of Edith Cavell was not shown in Havana as planned.

To guard liquor valued at two million dollars, the authorities of San Francisco are making requisition on Washington for a machine gun. Fear that the eastern crime wave may spread to the coast is the principal reason for the recommendation for a machine gun.

It is estimated that 50,000 of the 175,000 children brought before courts in the United States in a year should have been handled by some other method.

A new burglar alarm recently installed in a Newberg, Oregon, bank is in good working order. The vibration of an electric train passing by set it going.

In a recent hose test in Boston the water rushing through at a tremendous pressure resulted in the hose igniting from excessive friction caused by vibration between two cotton jackets.

There are only three ounces of radium in the world today. It is valued at $3,260,000 an ounce.

The name "D. Boone" was discovered chiseled in a rock at the mouth of a cave in Lincoln County, West Virginia. As the forms of the letters correspond with those found in the rocks of Kentucky it is thought that the famed hunter at one time made an expedition into that section of the country.

Abraham Lincoln's rail-splitting wedge with his initials cut in the steel has been placed in the United States National Museum in Washington.

More than 2,000 ships carry the American flag over 62 ocean lanes.

Ladies' shoes made of snake skin are now on the New York market.

Experiments have proved that various tree-like plants, bamboo and shrubby grasses, can be made into paper.

To warn miners of impending danger a strong-smelling liquid is injected into the main compressed air line at the surface. This liquid is quickly vaporized and carried to all parts of the mine where compressed air is used. Tests prove that an entire mine can be saturated in about eight minutes.

There is a fish which lies buried in the coral sand of the South Seas the spines of whose dorsal fin are hollow like the fangs of a rattlesnake. When stepped on it ejects a poison which kills or cripples the victim.

A tract of public lands in the northern part of Australia has been set aside by the government as a reservation for the tribes of aborigines of that country.

Conservative estimates place the rat population of the United States on an equal with that of the human population.

Baled cotton may now be treated with a chemical compound which renders it flame and spark proof.

The "short-circuit" bug is a beetle of California which is able to bore through wood and alloyed substances which are harder than lead. Hundreds of telephones are out of commission because of the depredations of this beetle which bores holes in the cables allowing the rain to enter.

The Ohio State University football team drank water from its home town when it played the University of California team at Pasadena. This action was taken to prevent possible sickness due to the bad effect of strange water.

The first kidnaping policy ever issued by an American insurance company was recently made out to an oil man in Oklahoma. This man insured his three daughters from kidnaping, each being insured for $5,000.

A noted German engineer states that coal, under 200 atmospheres pressure, heated to between 540 and 720 degrees Fahrenheit, and mixed with hydrogen gas, becomes liquid. As the energy is greatly increased he predicts that in the near future it will replace the solid coal.

A Paris physician is treating gassed soldiers with gases of balsamic bactericide composition. This antitoxic gas is forced into the lungs penetrating those parts affected by poisonous gas, spreading slowly over the wounds and healing them. There is not a single gassed man that he has treated who has not been completely cured.

Peyote, the dried flower of the mescal, a kind of cactus, is a powerful narcotic, with all the inherent dangers that are known to the use of narcotics. The Indians in the southwestern states use it in religious ceremonies but it is rapidly spreading to the North where some whites are using it.

The miners of Germany are wearing boots made of sheet-metal and solder.

Due to failure to receive full co-operation of its members and being unable to compete with the chain stores in the vicinity a co-operative store established by employes of the Treasury Department in Washington failed.

To prevent damage due to explosion the head of a Columbus, Ohio, firm has had the combination of his safe painted on the face of the strong box for the benefit of the crook who would otherwise blow it open.

A Danish physician has discovered a new fluid which removes all pain in wounds. It is a powerful disinfectant.

A new substitute for milk is now made from the common peanut. It was first produced in a southern university, and so closely resembles its prototype that it turns sour and curdles. It produces buttermilk and can be made into cheese but it still retains the peanut taste.

Colorado ranchers are advocating an open season on deer for the reason that the deer run with the cattle and consume the hay intended for the steers.

Chicago has a snow-loading machine which does the work of 12 trucks and 60 men.

Static electric sparks, resulting from friction of the folds of a silk dress being cleaned in gasoline, caused a fire in a cleaning establishment in Bend, Oregon.

Moonshine whisky received its name from the fact that it was first made by men who had stills in the hills and usually operated by moonlight. These distillers wished to evade the payment of tax and it was necessary that their operations be kept under cover.

Ex-presidents of the United States receive a pension of $25,000 a year after they retire by a provision in the will of Andrew Carnegie.

Farmers of New Zealand are complaining of the depredations of the Tasmanian opossums which were brought to New Zealand and released in bush areas. They had the reputation of being harmless, living quietly in forests, but they have multiplied exceedingly and are raiding orchards and fields.

The superintendent of the Fort Peck Indian agency in Montana has warned five small towns in the reservation that they must clean up the gambling and liquor elements before he will pay out the $166,000 allotment to the Indians on the reservation.

Many Men of Many Minds

Hamilton D. Mabie.—No man becomes great by accident. A man gets what he pays for in character, in work and in energy. The only road to advancement is to do your work so well that you are always ahead of the demands of your position. Keep ahead of your work and your work will push your fortunes for you.

W. G. Harding.—We are going to be called upon, nationally, collectively and individually, to renounce extravagance and learn anew the old lessons of thrift and providence.

Eugene G. Grace.—You must build up your body if you want to build up your brain, or build up your business.

Hiram W. Johnson.—We are all agreed, I take it, that if there is a real desire among the powers of the earth to prevent war, they can prevent it by disarmament; and if the five great nations of the earth, who constituted the five allied and associated powers in the World War, were to meet together and decide upon disarmament we would have taken the one great step toward the promotion of peace and the prevention of all future wars.

Disarmament Is One Great Step in Direction of Peace

Dr. Max G. Schlapp.—We forthwith should go back, under proper safeguards certainly, to the good old days when the schoolteacher was not afraid to administer "birch-medicine" to the refractory child; I believe a whole-souled spanking by his parents, administered at just the proper time, might have kept many a "bad boy" from coming up to me for psychological examination after he had gone so very wrong that a criminal or at least a practically useless life had been virtually assured to him.

William Boyce Thompson.—I believe that ninety-nine out of a hundred persons who fumble success may charge up their failure to a lack of foresight, or patience, to get all the facts about the thing they were undertaking. Show me a man who doesn't guess—who *knows*—and I will show you a man who is climbing.

John J. Pershing.—As we contemplate the causes of the World War and realize its horrors, every right-thinking man and woman must feel like demanding that some steps be taken to prevent its recurrence. An important step would be to curtail expenditures for the maintenance of navies and armies.

Major-General Von Seecht, of Germany.—We will keep our sword sharp and our shield untarnished. Inspired by such a true conception of honor and of patriotism and by this feeling of responsibility, the new army will be able to rival the old in efficiency.

Josephus Daniels.—If there is no League of Nations and no association of nations, then there ought to be a conference of all nations solely on the question of armament, along the lines of the provisions of the naval bill of 1916, which provided for a three-year program.

David Lloyd George.—Europe is standing in front of our shop windows. It wants to buy, but it is in rags and its pockets are full of paper. In the Good Book there is a great story of men who reconstructed a broken city with a trowel in one hand and a sword in the other; but Europe must set to work with both hands.

Carlyon Bellairs.—My final conclusion is that the League of Nations has already failed to stop the fresh race of armaments. The United States holds aloof from the League because of its European drift. It is time to try what the English-speaking peoples can do in combination.

Daniel Willard.—I believe that the railroads with the existing facilities could handle all the business likely to be offered during the twelve-month period, provided it came uniformly all during the year.

Hjalmar Branting.—After the revolutions which have overturned the military monarchies, it would be absurd to fancy that the practical, silent wish of the toiling masses for peace and international understanding will be helpless against the little minority who cling to the old system of armed peace.

Roger W. Babson.—The religion of the community is really the bulwark of business and of our investments. It means the real security for the stocks, bonds, mortgages, deeds and other investments which we own. The steel boxes, the legal papers and the other things that we look upon as so important, are the mere shell of the egg. The value of our investments depends not upon the strength of our banks, but upon the strength of our churches.

Frederick A. Wallis.—On three steamships which I inspected recently there were 1,100 persons with only $1 in their possession. During Christmas week 8,000 arrived with less than $20, and 4,000 with no money at all.

Floyd W. Parsons.—The uses of aerial photography are too numerous even to be imagined. It is a new industry, with a future that has limits as yet unknown. While commercial mapping will be one of the important fields of the new art, advertising specialists, construction engineers and others will use aerial oblique pictures extensively in the practice of their professions to show finished developments and construction progress.

Edmund B. Chaffee.—There ought to be an international opium board to find out the measure of the world's need of the drug and to aim at limiting the world's production to meet that amount and no more.

A. P. Johnson.—Don't fool yourself about being right because you are one in the crowd. Be a man and do what your conscience tells you is right. The world has always paid for industry, brains and efficiency and always will. Curtailment spells loss. Doing as little as you can will never get you anywhere. Doing as much as you can will.

Warren G. Harding.—No one has ever come to the presidency with more sincere desire than that which I hold for winning the concord of all the southern citizenship of America and having the people of the South understand how our American interests are in common and that only in complete concord can we hope to go on to the destined American fulfillment.

Paul S. Reinsch.—What is needed in the United States is a freemasonry of thinking men and women who will at all times keep their attention on foreign affairs, who will insist on publicity, and who will in turn point out to the greater public, mostly busy with other affairs, whatever deeply concerns our welfare and interest in foreign relations.

Thinking People Must Insist on Open Diplomacy

Dr. James Foster.—Civilizations which have risen to power in the past have crumbled when, in their moments of madness, they have forsaken Nature. By tomorrow, as the world moves, we shall have nothing but barren places to remind us of the animals and birds that used to be—nothing, unless we act promptly and without selfishness.

Walter Dill Scott.—The greatest asset of America today is not its fertile fields, its rich ores, its completely equipped factories or its millions in currency. The greatest asset in America is the American people.

Judge Willis B. Perkins.—No other country in the world gives such freedom to the activity of its people as the United States; on the other hand, no other country is so insistent under its laws that all men should perform their duty. This fact is too often overlooked.

General Tasker H. Bliss.—The nation that comes to such a conference and refuses to agree to any proposition looking to disarmament or at least a reduction in its military establishment could be written down as the next Germany and the United States could make plans accordingly.

William H. Anderson.—The liquor interests cannot believe their own eyes and ears and the evidence of their own senses. Although, since the advent of national prohibition, 236 distilleries, 1,090 breweries and 177,790 places holding licenses to sell liquor have been put out of business, they still believe they can "come back."

Representative George Huddleston.—I object to the system that has grown up of butchering a President of the United States to make a Washington holiday. These inaugural ceremonies have become so tainted with a low order of commercialism as to be unworthy of our great country. The whole scheme is to get as many people as possible to come to Washington so as to make good business for the hotels, boarding house keepers, and people who have something they want to sell. It is not for the purpose of inaugurating our Chief Executive in a becoming and dignified manner, but to draw a great mob, to get everybody who will to come to Washington to stare open-mouthed, from a distance, at the inaugural exercises, then to shiver around the streets for a few hours preliminary to giving up to the cormorants, profiteers and highwaymen that we have around this city what money they have in their pockets.

Inaugural Ceremony Has Been Feast "for the Profiteers"

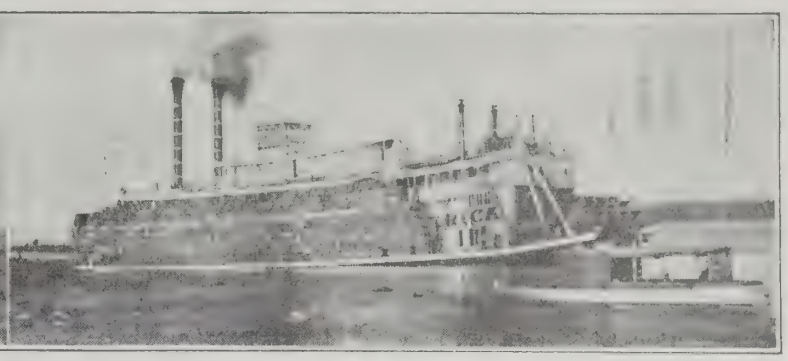
William Gibbs McAdoo.—The country is sick of political slanders and controversies. It wants domestic as well as international peace and it wants restoration of that fine spirit of co-operation which made America invincible in war.

Victor Sincere.—Opportunities are everywhere. The trouble is that folks don't recognize them. Why, it is an opportunity just to have a job where you can express yourself! Punctuality, veracity, willingness to work, loyalty, reliability, and readiness to take responsibility—all create opportunities for advancement; especially readiness to accept responsibility.

Leonard Wood.—We must drop the idea that singing the national anthem and carrying our national flag on patriotic occasions is all that is necessary for Americanization.

Jeremiah W. Jenks.—Perhaps no other country in the world, with the possible exception of India in earlier days, has been so afflicted with flood and famine as China. The Yellow River, "China's sorrow," alone has been responsible for the loss of millions of lives from floods and perhaps for the loss of even more lives from famine, because the famines have been brought on at times by the destruction of crops by floods, although at other times by lack of rain.

Woodrow Wilson.—The burdens of war are not lifted when the fighting is lifted.



Mary Garden.—I don't believe in a star regime. I believe in making the opera the thing and not the artist. I would have an understudy for every rôle and if one artist were ill, another would fill the place and there would never be a change of opera, even if all the principals were sick, as there is no one indispensable in the world.

Edward N. Hurley.—When you take personal initiative and responsibility out of business and substitute for it a kind of impersonal communal irresponsibility you are well on the way to bureaucracy.

Senator William S. Kenyon.—If the whole American people have been robbed on coal as the government has been robbed, the theft will amount to hundreds of millions of dollars.

One of the smaller inland packets, the "Lafourche," battling a storm on Lake Salvador, near New Orleans. The packet has been forced to proceed stern-foremost. She is towing first a house-barge, then two barges of crude oil and a crippled tug

The largest packet on the Mississippi River, the America, owned and operated by Captain L. V. Cooley, of New Orleans. She is shown here moored to the bank of the Mississippi and about two-thirds loaded with cotton bales.

The Mississippi Packet Comes Back

By HARRY H. DUNN

WAR seems sometimes not all bad in its results. It took a war—away back in the sixties—to put a great fleet of passenger and freight carriers to their task of opening the water-fringed lands of the Middle West, a fleet which a decree of the government under which it worked and prospered put out of business. Yet another and greater war is putting that fleet back on the rivers and lakes, the bayous and the bays and sounds and canals of the Mississippi Valley, just as it tried to put the fleets of the Stars and Stripes into every salt water port of the world, and failed, because the people of the Stars and Stripes seem to have forgotten the channels of trade when they lead beyond the terminals of our own railroads.

But within the past two years there has come from the hidden creeks, the smaller rivers, the old boat-houses, the broken landings of a hundred riverside inland ports, and even from the mud at the bottom of lakes and bayous, another fleet, the materializing ghosts of that once rich and powerful argosy that made the names of "Robert E. Lee," and "Natchez," and "America" and a score of others famous from MacGregor to New Orleans, and from the Sabine River of Texas to the east coast of Florida.

For the packets, once floating palaces, racing at full speed up and down the Mississippi, the Ohio, the Red, the Atchafalaya and a dozen other rivers, have returned to their work; to their mighty task of handling the north-and-south, and, to a lesser degree, the east-and-west traffic of a section which supports nearly 75 per cent of the population, 80 per cent of the industry, and fifty per cent of the wealth of this nation. Today, the New Orleans water front seldom shows less than a dozen of these steamers, boats of their own kind, peculiar to the waters they once made famous; more often there are a score in port, their heavy stern paddlewheels chopping the river into heavy foam, in contrast to the silent, ripple-less passage of the deep-sea tramps and liners as they go up and down the endless river.

This year alone, 43 steamboats, better known to the old-timers as "packets," came back to the streams of the lower Mississippi Valley. Where did they come from? No man can tell. Some were newly built, but the majority, of which the writer has been able to count 31, came from small inland ports where they had been tied up for the past fifteen to thirty years, waiting, waiting, almost hopelessly, against the time when they could again compete with the iron horse in freight and passenger traffic. From Memphis and Vicksburg and Greenville and Cairo; from the sheltered waters of the Bayou St. John, at New Orleans; from little towns on the Atchafalaya, the Red, and the Mississippi rivers; from fishing villages on Barataria and Lafourche and Vermillion bayous, and even from the far Sabine River of Texas, they were brought back, when railroad rates went to a height which made water hauls profitable.

The Interstate Commerce Act of 1887 put the great packets of the old days out of business by allowing the railroads to charge less for a long haul than for a short haul, provided the rail competition was with water carriers. For 33 years the work of the packets has been confined to the small interior streams of the South, and one could count the number of them plying into and out of New Orleans—once the greatest packet port in the world—on the fingers of one hand. Small motor freighters, which could be operated by two men at less cost than the packets with their expensive steam power and their larger crews, took their place almost as soon as the internal combustion engine came into common use, but now the packet, with its greater carrying capacity, is coming back, and battling with the power boat fleets for supremacy on the inland waterways of the South.

But there is one difference in this return of the packet: It is coming back as a freight carrier. It is coming back as a business proposition, not as a palatial pleasure boat, operating up and down the streams for the benefit of wealthy planters, of cotton and rice and sugar and cattle buyers and sellers, for the packet cannot compete with the passenger train, either north or south or east or west. But with railroad freight rates 20 to 40 per cent above the costs at which freight can be handled profitably by water, other people besides the waterways department of the Federal Government have learned that their average of 175 miles a day freight haul, as compared with the 24 miles a day of the average freight car, is a profitable investment of firewood, water, Negro labor and hulls which for these freighters seldom cost more than $25,000 to $30,000.

Realizing the size and importance of this back-to-the-water movement of freight, and that the packet owners and builders are going into it seriously, many cities along these rivers are investing large sums in terminals and cargo-handling facilities to meet the needs of the steamboat lines. New Orleans has assured the packet owners that a considerable part of the $6,500,000 which the board of commissioners of the port is to invest in harbor improvements within the next year, will be invested in such a way that the packets will have ample landing and freight handling facilities. Already the Bienville Landing, which is some 1,500 feet along the river, with a steel shed nearly 300 feet wide running its whole length, is overtaxed with the cargoes of these packets and of the motor freighters.

Lake Charles, a town in Louisiana 200 miles west of New Orleans, is preparing to put $4,000,000 into a navigable channel, nine feet deep and 60 feet wide at the top, which will give these boats access to the Gulf, and also free connection with the Intercoastal Canal, the link of which from New Orleans to the Sabine River is now being completed. Memphis is putting in floating terminals, rising and falling with the river, so that the landing stage always will be at deck-level of the packets. Vicksburg has commenced work on similar landings, and the new terminals on the river at St. Louis have been described at length so many times that it is useless repetition to more than mention them here.

Biloxi, Mississippi, is moving Congress and everybody else to get an appropriation for her Back Bay's development into a harbor for packet and motor freighter traffic. Mobile is putting several hundred thousand dollars into port improvements, including a large coal tipple, in which the Federal Government also is interested. Morgan City, 100 miles west of New Orleans, and located on the Atchafalaya River, one of the important north-and-south streams of the lower Mississippi Valley, is planning a bond issue for similar improvements, and seeking government aid in the dredging of a channel through Atchafalaya Bay to deep salt water. Greenville, Arkansas, which is one of the centers of packet traffic of the upper part of the lower valley—if you know what I mean—has developed lines up and down and across the river, and now has six packets operating in and out of the one little port.

Thus it goes all up and down the Mississippi River, as far north as the mouth of the Wisconsin River, and south to the Gulf, for some of these packets, even the smaller craft—of which more later—go out the mouth of the Mississippi, and other north-and-south streams, and become virtually coasting steamers in their work through Mississippi Sound to the east, and west through the hundreds of miles of bays and lakes and bayous of the great Louisiana marsh. But the romance of the old packet days, the wild life on board, the parties of one to two hundred planters and their wives and sons and daughters, gathered on board one of these old-time river steamers for a 1,000-mile trip on the Father of Waters; the mystery of the gamblers and the other adventurers who followed the frontier by water rather than by ox-train or on horseback, and even the races between the packets, which once were events of national interest, are gone forever. No more will any modern namesake of the "Lee" or the "Natchez" race from New Orleans to Memphis, or from Vicksburg to St. Louis.

And the answer is, according to Captain L. V. Cooley, of New Orleans:

"It doesn't pay."

Captain Cooley should know, for he has been for fifty years closely connected as owner, captain and mate, with the "Great White Fleet" of the Mississippi Valley, and today he owns and operates the largest steamboat on the river, the "America," more than 35 years old, and the last of the old-time passenger carrying packets. There in her wheel house, the huge ball room which still occupies virtually all of her upper deck, and surrounded by rooms which once would have made the stateroom on the average transatlantic liner seem small and poorly furnished, he outlined to me the new platform of the packet, why the river steamboats came back, and what part they are filling and will fill in the handling of the nation's commerce:

"The old-time packet was a pleasure boat," he said. "She carried freight it is true, but her main work was the transportation of passengers, before there were any north-and-south railroads, and even after there were such land lines, but before the Pullman car became as comfortable as it is today. People who traveled on these packets then lived just as if they were in a first-class hotel, but no hotel keeper today could afford to handle traffic as it was handled then, in competition with the railroads. As passenger carriers, the steamers never can compete with the

(Concluded on page 12)

The "half-way" packet, which as to size stands between the small inland waterways packet and the big Mississippi River steamboat. This one operates on such streams as the Atchafalaya, the Sabine, the Red, the Warrior and the Ohio.

The small boat-yard follows the packet just as rapidly as the packet follows the inland waterway. Here is one such yard, out of more than a score which have been established in different sections of the South during the past year.

Avoid This Poison Gas

THERE is being spread throughout the country a subtle propaganda which is gradually smothering the lately aroused sentiment in favor of restricting immigration. Whether it will succeed no one can say, but there is no mistaking the fact that it promises to come dangerously near such a result. Even the most credulous cannot trace the developments of the last three months without coming to a realization that there has been a strong, directing hand at work.

As late as three months ago immigration authorities were protesting vigorously that something must be done to shut off the stream of immigrants.

"The exodus of these Jewish people," said Commissioner Wallis last October, "amounts to a stampede. They are coming too fast for their own good. . . . I am convinced that a serious mistake has been made in letting these people come over in such a panic-like stampede as this."

The public press carried columns of news concerning the rush to America and chronicled very fully the fact that the bulk of those at our gates were of a character that made them practically unassimilable. The response of the public was what might be expected. A strong current of sentiment developed in favor of legislation which would restrict immigration and save the country from a plague of economic parasites. This tide of thought reached its flood at the opening of Congress when the majority of the House Committee on Immigration made its remarkable report in which it called a spade a spade and, after boldly declaring that the largest percentage of the immigrants were of Jewish extraction, went on to state that not only were they without funds but that many of them were incapable of earning a livelihood.

Further than this, the committee said that in general these immigrants were wasted by disease, poorly educated if not illiterate, suffering from dullness and stultification and wholly without any conception of national spirit. The House acted commendably. It passed the bill and sent the measure on to the Senate.

Then it was that the opposition began to show its cunning. First came the news in the press of the country of the organization of Jewish societies to fight the immigration law and statements began to appear in the press which ranged all the way from flat denials of the facts so carefully collected by American investigators to mere suggestions for delay.

The public was informed that there was absolutely no truth in the statement that thousands of Jewish immigrants were headed for America, and that Jewish aid societies would care for all those who arrived without means. There were promises that the objection to the congregation of these immigrants in the cities would be met by placing them on farms. There were cries that America would be untrue to her traditions if she barred those fleeing from religious or political persecution—an exception which, if granted, could immediately be interpreted broadly enough to admit every Jew in Europe.

And thus the process of unsettling the public mind was carried forward by denials, recrimination, charges of persecution and by a series of contradictory statements until the public mind, once so clear, grew befogged.

Now while the Johnson immigration measure is held in the Senate Committee its opponents have employed their resources so successfully that press associations are carrying news articles to the effect that immigration is falling off and that there is no emergency which justifies the passage of new laws.

"No Peril Seen of Alien Flood," read the headlines.

So in three months the situation, under the hands of skillful propagandists, has changed its aspect entirely. First and foremost, there is no flood of immigrants; second, they are not penniless nor undesirable; third, if they are penniless, funds will be provided for them when they arrive; and fourth, it is un-American to keep out these thousands upon thousands—who are not coming—because they are all the victims of religious and political persecution.

The one question remaining is whether this flood of poison gas was launched in time. It seems to have been let loose a little late but it may perform its work even yet, if the Senate is slow enough.

Who'll Add 'em Up?

THE United States is to have a navy larger than either Britain or Japan. But Britain's navy, says another report, will still be the larger. And Japan has plans which may challenge both, says another.

The simple truth is that the United States is spending a whale of a fortune on the navy; that Britain is spending another whale of a fortune on the navy; that Japan is ready to spend a third whale of a fortune on the navy.

The United States is contemplating more than $750,000,000 for the army; Britain's army estimates are so near a billion that the nation is staggered; Japan is sheer militarist.

France has a political fight, in the course of which her minister for war has resigned, on the issue whether France must maintain a very large or a superlatively large army. Greece has the largest army in its history. Throughout the Balkans the number of men in the army practically equals the number of men in each state.

Now, where is the man who can sit down and total up just how much the world is spending on armaments? How does the total being spent after the "war to end wars" compare with the expenditure before the war came?

It would be an interesting study. And how would this vast sum compare, for example, with the world's plans for agricultural development? In the United States we know that as much is asked for the equipment of the National Guard alone as for the whole Department of Agriculture.

If the figures for the world's army and navy expenditures today could be focused in one place, Christendom would be stunned.

Capturing the Copra

ONE little-noticed result of the war which will gain steadily in importance with time is the ascendancy of the United States in the Pacific. American and Japanese commerce has leaped, and at the expense of the British activities.

The United States had long possessed a lucrative connection with the Philippines; the war took British efforts elsewhere, and practically the entire copra trade fell to America, which gradually gained new commercial territory south of the line.

The actual situation today is that British trade in the Pacific is set back; Japan's aggressive plans have begun to dwindle; America's trade there is strong and growing, and already much advanced.

The phenomenon of Japan's failure to keep pace in what looked some time ago as a desperate trade struggle between that country and the United States, is due primarily to her domestic chaos and the puncture of the speculative bubble which was the most sensational result of her inflated war prosperity. She had engaged in ventures far exceeding the capacity of her resources, and when the vast war earnings were poured into wild speculation, the result was inevitable.

Japan has made great headway among the islands which she claimed and received, north of the Equator, under the Versailles Treaty; and the future will see the vast commercial benefits she will receive from them. But the sound financial position of the United States and the impregnable character of its business operations made competition, at the time, from the harassed Japanese an impossibility. Thus, in British Polynesia and other important but slightly known spots of the Pacific, American commerce is supreme.

A Threadbare Claim

EVERY now and then someone bobs up in Washington with a demand that the United States pay the Republic of Colombia $20,000,000 for the alleged theft of Panama. The proposal was advanced strongly during the early part of Mr. Wilson's administration and there have been indications that it will confront Mr. Harding after he takes office.

The proposal has not a leg on which to stand. Panama broke away from Colombia of her own volition and after repeated attempts to live amicably with her neighbor and maintain one governmental establishment. The revolt was precipitated by the fact that Colombia decided she could hold the United States up for more money than had been agreed upon and refused to ratify the treaty stipulated. Panama, a part of Colombia, felt that her only hope for the future lay in the building of the canal and she refused to surrender that hope to satisfy Colombia's greed. Therefore she struck for freedom, and Roosevelt, acting with characteristic promptness, recognized her claims and the result was the Hay-Varilla treaty between Panama and the United States providing for the canal.

Roosevelt, Hay and Root have all testified that the United States was legally and morally within her rights in the matter. "No one connected with this government," said Theodore Roosevelt in a message to Congress, "had any part in preparing, inciting or encouraging the late revolution on the Isthmus of Panama."

As for the charge that the United States acted hastily in recognizing Panama, Elihu Root summed the whole matter up and disposed of it in one sentence when he said, "If a thing is right and proper to do it does not make it criminal to do it promptly."

German Debts

A GOVERNMENT may have one idea, and its people another. The Great War proved that. In a general way, as the world understands it now, the ideas of the people are increasingly important, and the ideas of government lack force these days unless they express the desires of the people.

One of the straightest roads to international comity today as it has been always, is an understanding between peoples; this understanding does not rest on diplomatic exchanges, nor on the covert explanations of revolutionary societies. It is the confidence and understanding begotten of mutual publicity and appreciation.

On the whole the world realizes that in Germany are many millions of individuals, to whom war is a horror, and who have a well defined desire to live in peace and honor with their neighbors. The European press stresses perpetually the "Germany" of states; the nation which the treaty holds responsible for obligations still in dispute. But the quickest and clearest road to that world sympathy which must preface any genuine return to normal confidence is a direct study on both sides of the peoples concerned.

In this connection it is at the least interesting to learn, from an obscure item in a European newspaper, that private German debts to the number of 25,000 have been paid to foreign firms and individuals; and that these payments amount to $50,000,000. Of this amount no less than $45,000,000 actually came from within Germany itself, a fairly clear evidence of the good faith of German citizens and an open effort on their part to achieve honorable business rehabilitation.

These are facts that the plain people everywhere must consider before making judgments based solely on state issues as presented by foreign governments.

Our interest primarily is with the people, of Germany as elsewhere.

Commendable Simplicity

THERE is some quiet fault-finding with Mr. Harding over his decision to make the inaugural ceremonies as simple as is possible. Some quarters profess to believe that the request was needlessly penurious and that the total expense would have been nothing to a country as rich as the United States.

In this connection it may be observed that the actual practice of thrift is never popular because it means denial and those who dislike the present arrangements for March 4 are probably being denied either pleasure or profit.

The public at large, however, will have no objections to Mr. Harding launching his administration as simply as is possible, nor will it quarrel with him and accuse him of penuriousness because he was not above saving the nation a few hundred thousand dollars in government and private expenditures.

Mr. Ford's Page

THERE is nothing more condemnably mean than the habit of saying, "Everything is all right," when everything is not all right; or the habit of saying, "This is only a temporary flurry," when it is not a temporary flurry. The curse of false optimism! Ever since the day when some one said that a certain period of business uncertainty was "a psychological condition," there has been a belief that the way to deal with economic disturbances was just to smile and ignore them.

The newspapers try to do this. Directly the business thermometer goes down, the cartoonists and editorialists get on the job of graphic camouflage, until the hard, cold facts begin to force their way to the front on the news pages. No one is thought worth quoting who does not prophesy roseate times for all. The sound business prophet who tells the homely truth is not welcomed.

It is becoming a national weakness with us, that we shrink from unpleasant truths. Granting that a great deal of harm can be done by "calamity howling" and that there really is a psychological element to be considered at all times, it is nevertheless a greater thing to face the facts at their minimum of pleasantness, face the truth at its coldest, and build on that. This is what Americans dislike to do.

The weakness is not only American, of course; it is human. Governments know all about it. No government dares to trust its people with the truth at all times. During the war, the American people were treated in this respect just as the others were—some truths were not entrusted to us, for fear that, receiving them as a people, and thinking of them all at once, we could not bear them.

Now, the purpose of this page is not to make out that things are bad. It may be said at once that things are not nearly so bad as they might be, and they are soon going to be better than they now are. But there has been a narrow squeak. Conditions would be much worse if certain parties had their way. There are some people who rejoice to throw a country into helplessness, but this is a country which cannot very easily be handled that way.

If we are to become wise and be able to do our part in restoring and maintaining healthful conditions, we must face a few facts.

There are a goodly number of people in this country who ought to begin this moment and use their memories. They ought to recall the counsel that was given to them last spring. But more important than even that, they ought to recall how they took that counsel.

Some who thus call upon their memories will recall that the most reputable bankers of the country forewarned the people months ago—almost a year ago—of what was likely to come, and bade them get ready. But that warning was largely unheeded. Why? Because for years there has been an assiduous campaign, waged by voice and print, to discredit the counsel of bankers. Why? In order that the public might some time plunge headlong into disaster. And why wish the public to meet disaster? Because there is a class of people whose "times of prosperity" are other people's times of adversity.

There are, of course, bankers and bankers. But there are "white" bankers whose business is to assist business, and there are other "bankers" (falsely so named) whose business it is to mulct business of all it can. The former will come out clean from a very severe scrutiny of their conduct during the period in which this present period of slackness has been incubating.

They *did* advise the people rightly. They *did* take such means as would safeguard the people's real interests in the approaching storm. And they have maintained themselves in a position to be of assistance in restoring activities.

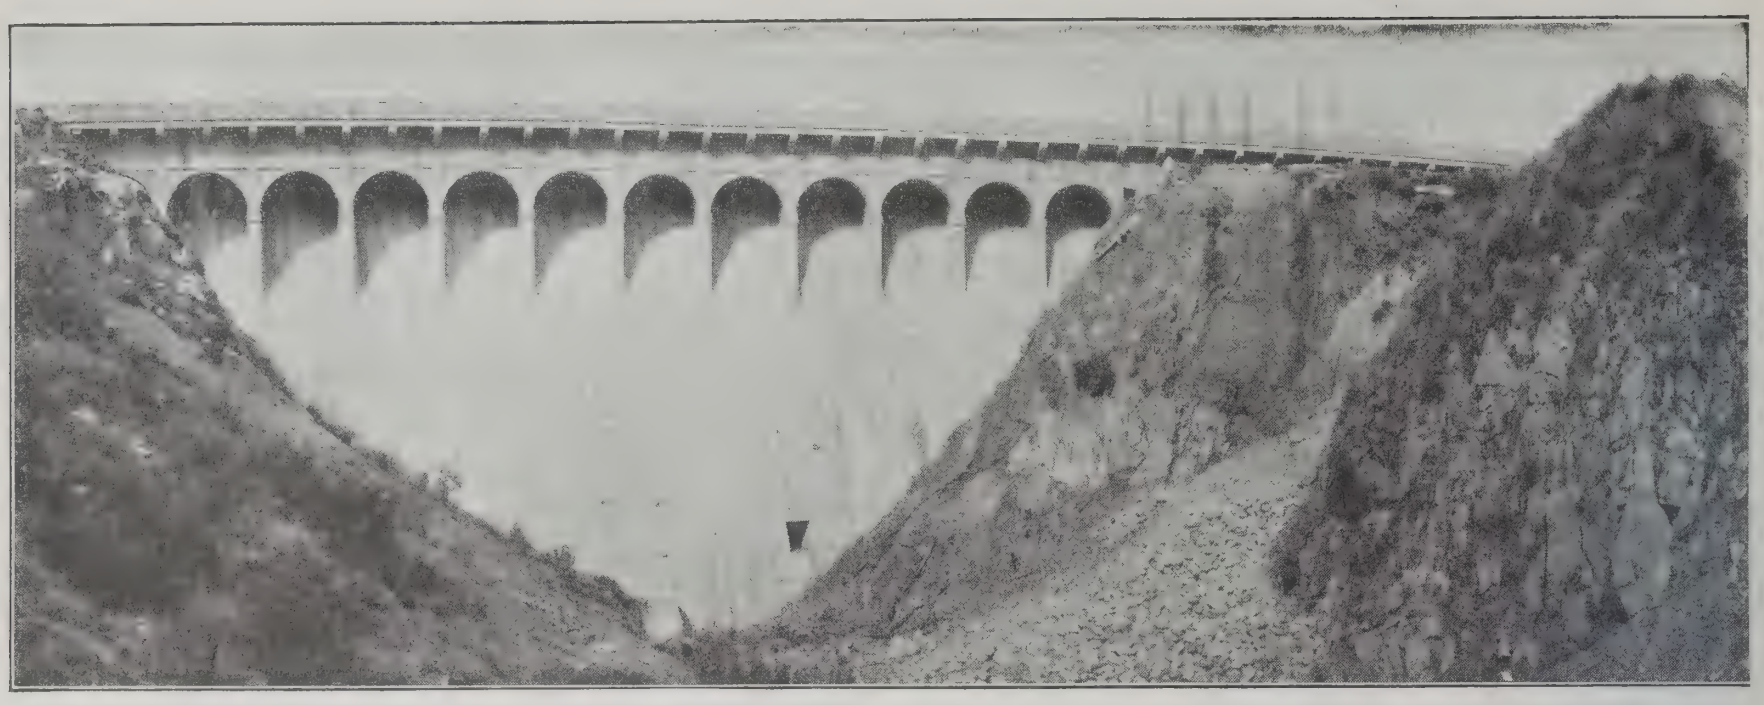
Credit where credit is due! When bankers advise thrift, they are looking to the soundness of the community. Of course, all the money that is spent eventually finds its way in the natural course of business into and out of the bank. The banker handles just as much money one way as the other. But with a thrifty people, while business may not be so full and flashy, it is sounder; and the banker's whole mission, if he be true to his profession, is to promote soundness.

Now, that advice was sound. It was given by sound men. But it was not largely taken. Some did take it, to be sure; many more did not. They were led along by the interests whose only business is to "get the money," perfectly indifferent as to whether "getting the money" spelled prosperity or stringency for the community at large. If the advice was not taken then, maybe a bit of counsel may be heeded now—inasmuch as all of us have had time to think. And this is the counsel: the advice given last spring when the present slackness was foreseen is just as wise and practical when the slackness begins to pass away. One objective of personal management ought always to be this: enough laid aside for a month's lay-off, a two-month's voluntary or involuntary idleness; enough to constitute a margin of time for a man to turn around.

We may say what we will of the High Cost of Living, there are few families that would not acknowledge, upon thinking about it, that they did not make the best use of the period of high wages. Many did, to be sure, and they are reaping the benefit of it now. But many did not, and they are able now to see how they might have done so.

The point is this: the people were educated to a point where they distrusted the men who knew best of all what the economic signs portended. People believe the doctor and the meteorologist; it is just as sensible to believe honest and informed men when they speak about the signs of the times. These men will usually be found to be among the "white" groups.

This in no wise whitewashes the wrongs that exist. It means only this: as long as we live under a system where such things occur, it is wise to avoid as much of the trouble as possible. And this must always be true: no system can ever be devised that will be so perfect as to shield us from the legitimate results of our own extravagance, idleness or waste.



Work will never be abolished. Limited means will never be abolished, because unlimited means is simply an impossibility. Division of toil will never be abolished. There are certain things which we have now, which we shall always have, and it is time we were getting ready to live with the Fact about these things.

We have been flirting too much with dreams and illusions. We have invited all the influences which deal in pride, contempt and discontent to make us their prey. Family life has allowed itself to be remodeled on what is without, rather than on the natural basis of domestic relations. We lived on the streets too much. The clothing trades caught us in their nets, making $5 neckties and $10 shirts almost a necessity for the young fellow who wanted to "keep up," until it came to pass that many a boy invested more on his feet than he did on his head. A man is worth what he carries in his head, and in that respect many of our young fellows were bankrupt long before the slack period came.

There has been a great return to common sense. The regrettable part is that the condition included many who did not personally need the lesson.

It is to be hoped that Memory will remain active for a long time to come. If you must fling money away, wait until you are not earning any, then spend your surplus: don't live up to the margin every week. A man is rich only to the extent that he can survive difficult times. And this right to survival he buys bit by bit, by industry and business views of spending, during the easy times. We are ready to blame this and that, but if we knew how much we ourselves as ordinary individuals contributed to the whole wrong situation, we should blame ourselves.

ALL the sober thoughts you have had recently are true thoughts. The watchers told many things last spring that the people did not believe, and now they have come upon us. If "prosperity" consists in thoughtless extravagance and a wild orgy of profiteering all along the line, we are better off without that kind of prosperity. It is not enriching financially, and it is impoverishing morally. That is over now. The hand of economic retribution has descended suddenly, and under its shadow millions of people who have no consciousness of affairs beyond their own pleasure, are now thinking soberly. Their thoughts will do them good. But that hand has not descended as crushingly as it might. It is just a warning. It will be lifted again. And we shall all be more sensible for having seen it.

Panorama of the rear of the Devil's Gate Dam as it appeared

Saving the Water for

By JOHN B.

THE county of Los Angeles in Southern California has just completed the first unit of the greatest water conservation plan known in the history of the world. The project embraces six great dams, one to be the highest in the world and another to be larger than even the famous Roosevelt Dam.

The entire project will cost between twenty and thirty million dollars. The expense it is expected will be borne jointly by the county of Los Angeles, the state of California and the government of the United States. One dam known as the Devil's Gate Dam was completed this winter. The second dam at San Dimas Canyon is in course of construction and plans are now drawn for the third and fourth dams to be located at Live Oak and Pacoima canyons. The plans for the other two dams at Tujunga and San Gabriel canyons are being drawn but are not yet completed, although the latter site has already been approved by A. P. Davis, director of the United States Reclamation Service, who built the Roosevelt and Arrowhead dams.

The history of flood control and water conservation dates back to the twelfth dynasty, or some 4,400 years ago. Joseph, that Israelite, who was captured by the Egyptians and later rose to be a ruler among them, was the first great flood control engineer of recorded history. He harnessed the Nile by a system of great levees, made the river thirty to forty feet deeper and created a storage basin known as Lake Moeris. Thus in time of drought he was enabled to feed not only the Egyptians but his own people, the Israelites. And thus is explained the seven lean and the seven fat years spoken of in the Bible.

Other efforts at flood control were made in early times on the Euphrates River in Mesopotamia where the river was leveed near Babylon but on one side only. In China, work done on the Yellow River shows that in ancient times the Chinese had engineers of marked ability. In France there has been some effort at flood control and the Italians have done work along these lines in endeavoring to control the River Po. Flood control in Germany has been largely a failure, the Teutons losing some twelve dams. Thus the work to be undertaken in Southern California will—owing to the diversity of the problems encountered—be largely pioneering in this field.

The San Gabriel Mountains—a United States forest reserve—form the watershed of the fertile coastal plain lying between them and the Pacific Ocean. This plain has a southwesterly drift and embraces practically all of Los Angeles County. Included in it are many thousand acres of the most fertile and most highly priced lands in the world. Included also are the cities of Los Angeles, Pasadena, Long Beach, Venice, Santa Monica, Pomona and many smaller towns with a total population of a million persons.

Two rivers, the Los Angeles and the San Gabriel, neither of them more than forty miles in length, drain this plain. Both of these rivers are dry streams part of the year but are raging torrents in flood time.

Southern California is known as the land of sunshine. The greater part of the year Old Sol is on the job. It is seldom that a drop of rain falls from the middle of May until the latter part of September. During the late autumn and early winter months there are occasional storms but most of the rainfall comes in the months of January, February and March.

The rainfall varies from 8 inches in extremely dry years to more than twenty inches in wet years. The average for the different sections of the county is between 12 and 14 inches. This rainfall would be sufficient for the land now under cultivation if it could be distributed properly but unfortunately the greater part of it descends in tremendous rain storms and not only is lost to the farmers and orchardists but on its way to the ocean it washes out thousands of acres of valuable land.

As more and more land has come under cultivation the problem of water supply has become increasingly serious. Because of lack of rain during the summer and autumn months the farmers and orchardists must depend upon irrigation. When there were but a few citrous groves and alfalfa ranches in the valleys there was plenty of water for all. Flowing wells were common and where it was necessary to install pumps they had only to go down a few feet to strike water. But now with thousands of acres of oranges and lemons, both of which use a tremendous amount of water during the dry months, the water level in the wells is steadily going down.

This condition is duplicated throughout the district and the ranchers are becoming alarmed. Will these valuable orchard lands ranging in value from $800 to $5,000 an acre be allowed to revert to the sagebrush and cactus covered land of the original desert for lack of water? Eminent engineers say that the country is already over-developed for the amount of water supply and yet every year there is more land being set out to citrous trees.

Some idea of the wealth thus endangered by lack of water conservation in Los Angeles County may be had when it is stated that the property value alone is more than one hundred billion dollars. The assessed valuation of property in this county five years ago equaled the assessed valuation of the states of New Mexico, Arizona, Nevada, Utah and Vermont.

Neither the county, the state nor the nation can allow this wealth to be lost through lack of assistance even though it entails the expenditure of thirty millions.

The orchardists and farmers have resorted to all manner of expedients to conserve and distribute equitably the water. Two hundred and twenty co-operative water companies have been formed and wells are being sunk deeper and deeper. Much litigation has been engendered by the effort of some men to corral the water in certain districts and then charge a prohibitive price for it. Bitter feeling has been aroused between neighbors and injunctions against sinking new wells are not uncommon. But nothing alters the fact that the supply is continually becoming lower. Like the gasoline situation it is not so much that there is less water than in previous years, but that there are more consumers.

It is only quite recently, following an especially dry season two years ago, that the situation has begun to excite general alarm.

Previous to that it was more a matter of flood control than water conservation but now the latter phase has become the more important.

The matter of flood control and the necessity of doing something along these lines was brought forcibly to the attention of the people of Los Angeles County in 1914 and in 1916 when two disastrous floods caused an actual property damage, in loss of bridges and washing out of land, of ten million dollars.

Business was practically at a standstill for two weeks causing a further loss that could not be estimated in dollars. The board of supervisors of Los Angeles County, responding to the pressure of public opinion, appointed a commission of five eminent civil engineers to investigate the situation and to prepare plans for flood control.

One of the members of this commission was James W. Reagan. Reagan had been a railroad engineer most of his life. He had done hundreds of miles of railroad location work. For thirty years he had done railroad construction work in the United States, Mexico and South Africa. He had been a professor of engineering in St. Paul's College in Kansas. He was thoroughly grounded in all branches of his profession but he had had but slight experience in problems that related to flood control work.

From the moment of his appointment upon the flood control commission, however, he delved into research work. He wrote to the experts of foreign governments and procured all the obtainable data relating to flood control work in this and other countries. He read every book upon the subject he could procure.

When the report of the commission was turned in there was a difference of opinion. Four of the engineers had agreed upon a plan. Reagan turned in a minority report. He stood alone. Yet Reagan's plan was adopted and he was made chief engineer of the Los Angeles County Board of Flood Control.

This board consists of five members who are also members of the board of supervisors. The flood control district was organized independent of the county boundaries and does not take in quite all of Los Angeles County. This was done to get around the state law which provides that in all bond elections held in counties there must be a two-thirds majority returned to carry the bonds while in districts especially organized it only requires a simple majority of all the votes cast. The district can also spend money outside of the county and outside of the district where it is necessary for flood control and water conservation within the district.

A bond issue of $4,450,000 was voted by the district, the state contributed $1,080,000 and the government a like sum. In return for the government appropriation the county bound itself to maintain the channels, build the bridges and find the right of way.

Devil's Gate Dam showing lake, spillway and boulevard over top of dam as it will appear when filled with flood waters.

Check dam in foothills of San Gabriel Mountains, showing type of construction and height of same. This dam costs about $40 and is designed to help prevent erosion as well as conserve water. It is one of several thousand used for this purpose.

before the flood waters filled up the canyons and formed the lake.

Our California Fruits

WALLACE

As Reagan explains it, his problem was simple. It was to provide as easy and direct a route as possible for the flood waters to reach the ocean. The Los Angeles and San Gabriel rivers, both known as torrential streams, must be straightened, the channels deepened and their course directed around the harbors of Los Angeles and Long Beach so that they would not fill them up with silt.

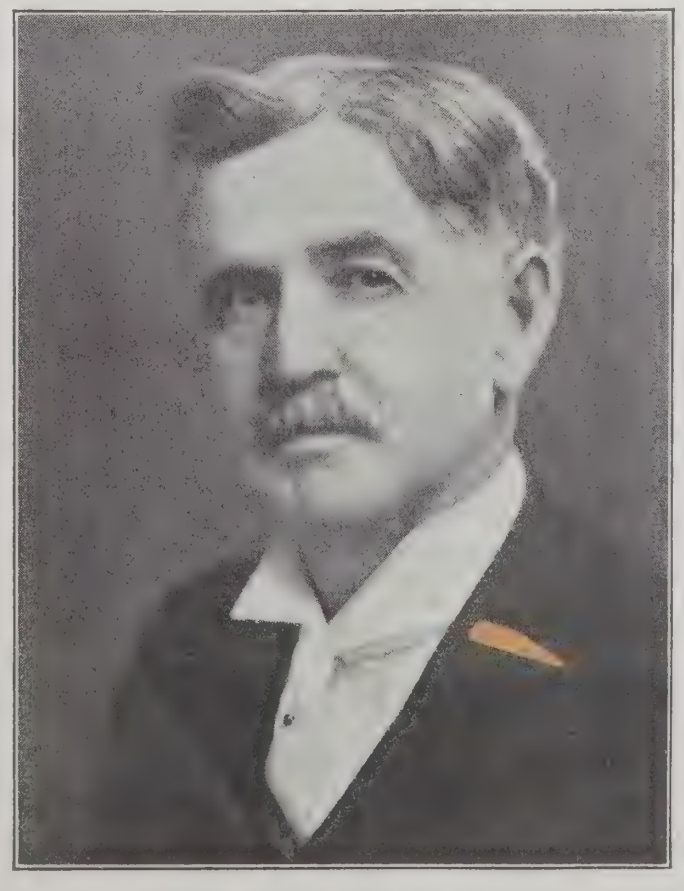
Because of a forest fire that burned a considerable area of the timber and underbrush in the mountains two years ago there has been a great deal of wash during flood times and the streams have been full of silt and boulders.

Through the use of iron pipes and fir pilings, Reagan has managed to straighten the channels of the rivers. More than thirty miles of this material has been used. A revetted channel takes the water around the harbors into the ocean.

Reagan has proceeded on the theory that water will seek its load of detritus along the lines of least resistance and by placing double rows of piping and piling at the bends and other places where past experience has shown that in flood time the water has a tendency to spread out and overflow farm and orchard lands, he has managed not only to confine the flood to the natural channel but to cause the rivers to deepen their own channels by taking the load from the river bottom instead of from their sides.

Before beginning upon the work of straightening up these meandering streams which in the floods of 1914 and 1916 had taken out and dumped into the ocean harbors of Los Angeles and Long Beach some 14,000,000 cubic yards of valuable soil, Reagan put two men upon research work among the older inhabitants of the district to obtain a history of great previous floods. They managed to get a record as far back as 1847 and discovered that since 1864 the San Gabriel River had cut more than 60 miles of new channels, a mileage equal to its entire length from its headwaters. Through the data obtained and by tracing some of these old channels, Reagan was greatly guided in planning the new courses he had determined to make the river follow.

But to the practical mind of the engineer this work seemed strangely futile especially as the importance of water conservation began to be realized more fully. With the whole country in need of water it seemed a shame to allow these great torrents to rush to the ocean through a thirsty land. How to hold it back in the mountains and foothills was the problem that occupied Reagan's mind from the beginning. But with a country already taxed to the limit Reagan knew that it would take a long campaign of education before the voters of the district could be led to view with equanimity such a tremendous expenditure of money as the construction of the dams necessary to real water conservation would entail.



Although the first bond issue carried by a large majority there has been from the start bitter opposition from a small but determined minority of property owners. This is the same element which always in every community oppose public improvements unless they can be shown that the improvements will be of direct pecuniary benefit to themselves. Much of the opposition, however, comes from ignorance of the vital necessity for water conservation. Through the newspapers which have almost as a unit supported the plans of Mr. Reagan much of this opposition has been dissipated with the result that the first great dam known as the Devil's Gate Dam has already been completed and is ready to receive and store the winter and spring floods of 1921.

One of the measures which has received the ardent support of those opposed to the great dams has been the building of what are known as check dams. These are small dams built on the hillsides, and in such other places as the contour of the land will permit, to catch the rainfall and hold it back until it can sink into the ground and replenish the supply for the wells. The district has constructed some 3,800 of these check dams at a cost of $125,000. They are built of stone and cement, most of the material usually being found on or near the spot where they are constructed.

In times of ordinary rainfall they serve to retain the water and allow it to seep into the ground and in times of flood they are of some value in catching and holding back detritus especially in the burned over areas.

But like the work being done on the river beds, Reagan considers them to be but a temporary expedient. With the completion of the big storage reservoirs in the foothills there will be no necessity for check dams and the river beds of the San Gabriel River may be planted to gardens and orchards.

The Devil's Gate Dam built in the Arroyo Seco near Pasadena is a gravity type dam built of high grade concrete. It might be mentioned at this time that all the concrete used in these dams is furnished by the county to the contractor. By thus making his own cement, Reagan removes all temptation for a contractor to furnish inferior material and he has entire control of every bit of material that goes into the construction of the dams.

JAMES W. REAGAN

Chief engineer of the Los Angeles County flood control district.

The Devil's Gate Dam is 200 feet wide at the bottom and 310 feet wide at the top with a thickness of 87 feet and a height of 130 feet above bed rock. It cost $370,000 to build. In addition to the spillway which will carry an enormous volume of water the dam is further protected by a tunnel bored through solid rock and through which the water in the dam can be drained when necessary. Two radial gates operated hydraulically guard the entrance to the tunnel. A wide driveway forms the continuation of a boulevard across the top of the dam which when it is filled with water will combine great scenic beauty with utility. The dam is capable of storing at its fullest capacity 6,700 acre feet of water.

The dam at San Dimas Canyon now in course of construction is to be 100 feet wide at the bottom and 350 feet wide at the top and 140 feet above bed rock with a thickness of 95 feet. It will store 3,500 acre feet of water and will cost $600,000. A lake will be formed about three miles long.

The Live Oak Dam, the smallest of the six, will also be of the gravity type. It will be 40 feet wide at the bottom and 250 feet wide at the top with a height of 50 feet above bed rock and a thickness of 30 feet. It will hold 400 acre feet of water.

The Pacoima Dam when completed will be the highest dam in the world, being 24 feet higher than the Arrow Rock Dam in Idaho or 375 feet above bed rock. It is to be of the type known as a constant angle arch dam and will cost $1,500,000. It will be only 40 feet wide at the bottom and 450 feet wide at the top with a thickness of 100 feet. It is to be built in a gorge in the mountains above the town of San Fernando and the rich valley of that name. It will hold 12,000 acre feet of water.

The San Gabriel Dam will be an enormous affair larger than any dam in the world and will cost between fifteen and twenty million dollars. The site tentatively approved by A. P. Davis, director of the United States Reclamation Service, is just below the junction of the two forks of the San Gabriel River in the San Gabriel Canyon. The dam will be 1,000 feet long at the bottom and 1,600 feet long at the top with a height of 400 feet above bed rock. The lake formed by this immense dam will be six miles long with a surface area of three and one-half square miles and a storage capacity of 200,000 acre feet. It will have a drainage area of 130,000 acres and will be capable of retaining two floods of the size of those in 1914 and 1916.

The Tajunga Dam which would control the waters of the Los Angeles River is as yet but a project of the future. Mr. Reagan has found a perfectly feasible site for a dam in the Tajunga Canyon but has not yet drawn any plans.

These great dams will not only store the flood waters in the mountains for use for irrigating purposes and prevent the yearly damage to land and property caused by the floods but will also provide great fishing and amusement resorts within easy riding distance of the cities. It is anticipated that the government will stock the lakes thus formed with fish. Already choice sites for building summer cottages about the lakes to be formed in San Dimas and Pacoima canyons are being sold by enterprising real estate companies and various amusement enterprises are being planned.

It is anticipated that it will take several years to fill these great reservoirs but once filled they can be kept to a certain capacity which will permit the gradual withdrawal of the waters and keep streams which are now dry most of the year alive throughout the summer seasons. This water will seep into the ground on its way to the ocean and fill the great underground reservoirs from which the wells are supplied. In this way it is hoped to raise the water lever in the wells or at least to maintain the present level.

How Jews Capitalized a Protest Against Jews

When the Public Revolted Against Jewish Theatrical Trust, Other Jews Came in as "Independents" and "Reformers."

(Continuing the series on Jewish Control of the Theater, begun in the issue of January 1, and continued in the issue of January 8.)

THE American Stage is under the influence and control of a group of former bootblacks, newsboys, ticket speculators, prize ring habitues, and Bowery characters. At the present writing the most advertised man in the world of theatrical production is Morris Gest, a Russian Jew, who has produced the most salacious spectacles ever shown in America—"Aphrodite" and "Mecca." It is reported that the scent of nastiness has been so strongly circulated among theatergoers that tickets are sold a year ahead for the Chicago exhibition of one of these shows, the patrons being, of course, mostly Gentiles.

Now, it is a fair question, who is this Morris Gest who stalks before his fellow Jews as the most successful producer of the year? It is nothing against him to say that he came from Russia. It is nothing against him to say that he is a Jew. It is nothing against him to say that although success has favored him, his father and mother are still in Odessa, or were until recently. Yet, in a recent interview, in which the professional note of pathos was obtrusively present, he lamented that he was not able to bring his parents to America.

The story of Morris Gest is the last one in the world to use as a "success story" of the type of "the poor immigrant boy who became a great theatrical producer." He is not a great producer, of course, although he is a great panderer to the least creditable tastes of a public whose taste he has been no mean factor in debasing. Gest sold newspapers in Boston, and became property boy in a Boston theater. In 1906 he was a member of a notorious gang of ticket speculators who were the bane of the public until ticket-peddling on the sidewalks in front of theaters was suppressed by the police. There are still other stories told about him that link his name with another sort of traffic, but whether these stories are true or not, there is nothing in Gest's career to indicate that he would ever contribute anything to the theater's best interest. He is the son-in-law of David Belasco.

The Genesis of Our Drama Masters

THEN there is Sam Harris, long the junior partner of the firm of Cohan and Harris, who began his career in the arts by managing Dixon, the colored champion featherweight pugilist, and the redoubtable Terry McGovern, champion lightweight prize fighter. With tastes formed at the ringside, he launched into theatrical ventures, allying himself with Al Woods. He catered to the lower classes and made a fortune by producing atrocious melodramas in second and third class houses.

And yet this is the Sam Harris who commands the patronage of hundreds of thousands, yes, millions of theatergoers, some of whom go on innocently believing that when they invade the theater they also enter, by some mystical process, "the realms of art."

Al H. Woods has but one good eye. It is not this personal loss that matters, but the history of the misfortune which goes back to the time when Al was a member of an East Side gang. The common report was that he used to play the piano in a downtown place, east of Fifth Avenue. Mr. Woods is also a distinguished patron of dramatic art—he presented "The Girl From Rector's" and "The Girl in the Taxi," two of the most immoral and pointless shows of recent years. Several times has secured the rights to certain Viennese operas which were bad enough in themselves from a moral point of view, but which were at least constructed with true artistry; but even these he marred by an inept infusion of vulgarity and blague.

The public, of course, does not see and does not know these gods before whom they pour their millions yearly, nor does the public know from what source theatric vileness comes. It is amusing to listen to the fledgling philosophers discuss the "tendencies of the stage," or expatiate learnedly on the "divine right of Art" to be as flippant and as filthy as it pleases, when all the time the "tendency" is started and the "art" is determined by men whose antecedents would make Art scream!

The American Theater is a small group of Jewish promoters and a large group of Gentile gullibles, and it is only the latter who "kid themselves" that there is anything real about the matter.

It is perfectly natural, therefore, that the complete Judaization of the Theater should result in its being transformed into "the show business," a mere matter of trade and barter. The real producers are often not culturally equipped for anything more than the baldest business. They can hire what they want, mechanicians, costumers, painters, writers, musicians. With their gauge of public taste and their models of action formed upon the race track and the prize ring; with their whole ideal modeled upon the ambition to pander to depravity, instead of serving legitimate needs, it is not surprising that the standards of the Theater should now be at their lowest mark.

As theatergoers are noticing more and more, the Jewish manager whenever possible employs Jewish actors and actresses. Gentile playwrights and actors are steadily diminishing in number for want of a market. At times the employment of Jewish actors has been so obtrusive as to endanger the success of the play. This was notably the case when the part of a young Christian girl of the early Christian Era was given to a Jewess of pronounced racial features. The selection was so glaringly inept, ethnically and historically, that it militated strongly against the impression the play was intended to produce.

Jews in the Stage Profession

THE "cover-name" conceals from the theatergoing public the fact that the actors and actresses who purvey entertainment are, in large and growing proportion, Jewish.

Some of the more prominent Jewish actors, many of them prime favorites, are Al Jolson, Charlie Chaplin, Louis Mann, Sam Bernard, David Warfield, Joe Weber, Barney Bernard, "Ed Wynne, or to mention his real name, Israel Leopold," Lou Fields, Eddie Cantor, Robert Warwick.

Among the prominent Jewish actresses are: Theda Bara, Nora Bayes, Olga Nethersole, Irene Franklin, Gertrude Hoffman, Mizi Hajos, Fanny Brice (wife of Nicky Arnstein), Bertha Kalisch, Jose Collins, Ethel Levy, Belle Baker, Constance Collier. The late Anna Held was a Jewess.

In addition to these there are others whose racial identity is not revealed by their names or any public knowledge about them.

The Jewish press claims for the Jews, aside from the commercial control of the stage, the control of the fun-making business. "The greatest entertainers, vaudevillians and fun makers are Jews," says an article in the Chicago *Jewish Sentinel,* commenting on the extent to which Jewish actors monopolized the Chicago stage that week.

Among the composers we once beheld Victor Herbert and Gustav Kerker in honorable places; but now the Irving Berlins have forced themselves into places hewn out and established by Gentiles who had a regard for art.

There are no great Jewish playwrights. Charles Klein wrote "The Lion and the Mouse," but never repeated. There is, of course, much commonplace work turned out for the stage; a commercialized stage needs a certain amount of "product." Among those engaged in such work are Jack Lait, Montague Glass, Samuel Shipman, Jules Eckert Goodman, Aaron Hoffman, and others.

The Jewish claim to exceptional genius is not borne out by the Theater, although the Jewish will to power is therein amply illustrated.

Belasco's name comes to mind, perhaps, oftener than any; and Belasco is the most consummate actor off any stage. To understand Mr. Belasco is to understand the method by which the "Independents" fought the Jewish Theater Trust, and still retained the monopoly of the Theater for the Jews.

The Revolt Against the Czars

THE old Trust was bowling along merrily, smashing everything in its way, thrusting honored "stars" into obscurity, blocking the path of promising playwrights, putting out of business all actors who would not prostitute art to commercialism, and there occurred what always occurs—for even the Jews are not superior to natural law—a bad case of "big head" was developed.

Klaw, Erlanger and their immediate associates felt themselves to be kings and began to exhibit a few supposedly royal idiosyncracies.

There were some protests, of course, against the arrogance of the Czars of the Theater. The Vanderbilts and other New York millionaires embodied their protest in a movement toward a national theater which was erected at Grand Central Park, and for which $1,000,000 was spent. One of the members of the Trust proved his birth and breeding by saying that this attempt to cleanse the theater was really only a plan to provide a place of vice for the benefit of the millionaire backers. The remark inspired deep rancor, but was more revelatory of the Jewish Trust's essential conception of the theater, than anything else.

Belasco came from San Francisco, where he had done various stunts, including those of an itinerant recitationist, illusionist and actor. James E. Herne took an interest in him as a youth and discovered him to be adept in helping himself to dialogues out of printed plays. Under Herne, Belasco learned much about stage effects, and soon became very successful in touching up defective plays. Coming to New York, Belasco fell in with DeMille, a Jewish writer for the stage, who only needed Belasco's "sense of the theater" to make his qualities effective.

Belasco became a factor in enlarging the Jewish control of the stage, in this way: he was connected with the Frohmans, but was unable to persuade them that Mrs. Leslie Carter, who had been the center of a sensational divorce suit and who had placed herself under Mr. Belasco's professional direction, was a great actress. The making of a star out of Mrs. Carter, and the gaining of public recognition for her, proved a long task. The Frohmans were unsympathetic.

Then, among the managers there was dissension too. The Shuberts had been compelled to take the leavings of the other Jewish magnates, especially the leavings of Charles Frohman, and the Shuberts revolted. The Shuberts were natives of Syracuse, and their preparation for the theater was not promising of their devotion to art. They were program boys and ushers. Then the haberdashery business claimed them as possibly a speedier course to wealth. Samuel Shubert eventually became a ticket seller in the box office. In due time, having learned a few marketable secrets of the theater, he launched a frivolous burlesque and comedy show. With this he floated into New York, and continued with his musical shows of a shallow kind, until the name Shubert has come to be descriptive of the productions. The Shuberts, of course, booked in Trust theaters.

About the year 1900, the Shuberts quarreled with the Trust and Belasco quarreled with the Frohmans, and the two hailed each other as fellow belligerents and proceeded to see what could be made of their belligerency. The public was showing signs of disgust with the Trust. That was the cue!—the Shuberts and Belasco would appeal to the public to help in the fight against the Trust. Belasco and the Shuberts would play the part of injured independents; public sympathy would be aroused, and public patronage would boost the "Independents" into the strength of a new Trust. That is exactly what occurred.

How Mr. Belasco Did His Part

BELASCO'S theatricalism helped to this end. He is an actor off, as well as on the stage. He affects the pose of a benevolent priest, and dresses the part, wearing a priestly collar, with clerical vest and coat. Although of Portuguese-Hebraic origin, Belasco dresses after this manner to honor, as he says, a tutor of his early days. Anyway, the costume is very effective, especially with the ladies. He has a tremulous, shy way about him, and he sits in his sanctum with the lights so arranged that his priestly face and splendid shock of silver hair seem to rise out of an encompassing and shadowy mystery. It is very effective—very effective. One woman declared, after being admitted to the presence and gazing on the face that rose out of the shadows into the light—"I have a better understanding of the divine humility of Jesus Christ since I have been privileged to meet Mr. Belasco."

Thus, "the master," as he is called, was well equipped to appeal to public sympathy. And he did appeal. There was no end to his appeal. He told stories of personal attacks made on him. He wrung his hands in desperate grief against the Trust's menace to the stage. His own productions, however, were not all immaculate. There was one, "Naughty Anthony" which brought the police censor down upon him. But there was a very clear conception in the public mind as to what the Trust had done to the stage; Belasco said he was against the Trust, and the rest was snap judgment.

The Shuberts and Belasco thus found themselves in a very favorable combination of circumstances. Their first financial aid came, strangely enough, through ex-Congressman Reinach, a Jew, "Boss" Cox, of Ohio, and others who were interested. These supplied the first money; the Shuberts supplied the management; Belasco supplied the wonderful impersonation of a Daniel come to call the Jewish Theater Trust to judgment. The campaign succeeded and wealth rolled in. For a time Belasco did prove to the public that he could pro-

duce better plays than the old Trust had given to the public, and to that extent he justified public confidence in him.

The end of the old Trust came in a natural way. The Shuberts became rich and powerful, and the Trust was then willing to do business with them. Some of the Trust members died, and about 1910 the old Trust ceased to exist as the dominant factor in American theatrical affairs. But the rise of the "Independents" did not bring relief; it only captured for Jewish enterprise that part of the theater which might have become the prize of a legitimate body of protesters against the old cheapness and vulgarity. The pretended protest won. The Theater was saved to Jewish control.

Jewish managers had created the public disgust in the first place. They knew what the public reaction would be, so they prepared to capitalize the reaction, and thus control the theatergoing public both going and coming. This they did with admirable strategy.

During the outbreak there was some genuine feeling of independence on the part of a few non-Jewish managers. John Cort organized a western theater circuit. Colonel Henry W. Savage swung loose from Klaw and Erlanger, as did also William A. Brady. But independence of the Jewish control has never flourished. Wherever it did keep up an independent front, it stood for the theater in its best sense, and served as the only channel of expression for the remaining few stage artists. The coming of the motion picture, however, gave true independence its quietus. The motion picture "industry"—and it is rightly named an "industry"—is entirely Jewish controlled, and as it is pushing its way into the legitimate theaters and crowding out human players for long periods every year, theater managers have to bow to it more and more.

It remained for the Shuberts, however, to give the theatrical business a most original twist. They made it a real estate speculation. Readers of this article may recall that recently they have read that in their own or a neighboring city the Shuberts are going to build one or two theaters. In one city, the announcement was made that two theaters were to be built. That particular city happens to need almost everything else but theaters. However it cannot get anything else that it needs, and there is no doubt it will get the theaters.

The Shuberts learned this trick when they were supposed to be "bucking the Trust." They went after any building they could get, and because of the public enmity to the Trust, they got better terms than otherwise could have been possible. An old riding school in New York became the Winter Garden. The great Hippodrome, the materialized dream of a non-Jew, Frederick Thompson, was taken over by the Shuberts. It soon dawned on the Shuberts that there was more money in theatrical real estate than in theatrical art.

The Theater a Real Estate "Spec."

TODAY, the Shuberts, while nominally theatrical managers, are really dealers in theatrical leases and buildings where theatrical productions are made. A theater, as a real estate proposition, pays amazingly well. Figure up the amount of space you occupy at a show, the length of time you occupy it, and the price you pay for it. It is Rent raised to the *nth* degree; then the offices which make the bulk of the structure, and the stores in front. Really, "the show business" is the minor consideration.

What does it cost the Shuberts? Very little but the use of their name. When it is the matter of a new theater, outside capital supplies three-fourths of the money, but the lease and the control are vested in the Shuberts. That is a rather handsome arrangement.

In the matter of producing plays, the same arrangement is often followed—the author, the star, or their backers supplying the larger part, sometimes all of the capital, while the Shuberts lend their name to the management and take their share of the booking fees and the rental of the theaters where the show is produced.

In October of last year (1920) a serious slump hit the theatrical business. Even in New York the theaters were experiencing the worst depression of years. More than 3,000 actors were idle and managers were compelled to resort to the cut-rate ticket agents to sell their seats. And yet, in the midst of it, Shubert announced six new theaters for New York alone. At the same time they announced the production of forty plays.

Forty plays! If a man announced that he was going to build six new art museums in one city and fit them up with the requisite number of oil paintings produced under his own direction, he would be considered crazy, especially if it were a matter of common repute that he knew nothing of art and was having the pictures painted merely to give value to his real estate!

It indicates how thoroughly accustomed the public has become to "the show business" and the "motion picture industry," that the announcement of these former haberdashers is taken so complacently. Forty plays!—when anyone can count on the fingers of both hands all the present-day American and English playwrights even remotely deserving of notice!

It is said that the Shuberts do not expect more than three out of forty plays to succeed. The success of a play, in the artistic sense, is not their business. To maintain enough plays on the road to keep alive their real estate investments is really the thing.

Thus it is now not strange where theatrical slang comes from. An actor who wins success is said to have "delivered the goods." An approved actress is "all wool and a yard wide." An author "puts it over" his audience. A girl of no particular class is a "skirt." A young chorus girl is a "broiler" or a "chicken." An actress who plays the part of an adventuress is a "vamp." A very successful play is a "knockout." Taken all together, it is "the show business." This is the effect of Jewish control of any profession—as any American lawyer will tell you.

There is now a non-Jewish generation which is totally ignorant of stage traditions and which accepts the modern stage as being what it always was and always will be. That generation is a product of Jewish management. The only protest now being offered is by the small dramatic clubs which, whether or not they know it, are the strongest "anti-Semitic" influence on the theatrical horizon.

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

"A Gem From the Talmud"

"Three who lament and no one can help them: he who lends money without witness; he who holds his business in the name of a Gentile; and he who lets his wife rule him."

Hurrah for Revolution!

"Russia has shown us that when the people have conquered their rulers and oppressors, also the Jewish people can be free continually and have equal rights."—Chicago *Forward.*

Goy Stupidity

"Unclean hands of slanderers are endeavoring to throw upon our black veil of mourning the red garment of an executioner. We who are tortured by the thirst for peace and rest, are proclaimed by obdurate and ignorant people the principal promoters of the world unrest . . . . Had we been malignant, how haughtily we would have derided the *stupidity* of our enemies, *the hopeless inanity of their brains,* and their humiliating *fear* of our exaggerated strength . . . ./In this third anniversary (of the Bolshevist revolution), the saddest of all our sad anniversaries, we repeat the sorrowful query: 'Watchman, how old is the night? how old?' "—*Jewish Tribune,* Paris. A typical Jewish appraisal this, of *Goy* brains and character. It is quite in line with references throughout the "Protocols" to Gentile stupidity, inanity, bovine dullness and cowardice.

One Probable Outcome of Bolshevism

Captain Francis M'Cullagh, who recently escaped from Bolshevist Russia, writes, in the *Fortnightly Review*: "The most probable outcome of this Russian experiment will be a successful military reaction involving the extermination of half a million Reds and perhaps another half million of 'inoffensive Jews,' after which the pendulum will go on swinging . . . . until it finally comes to rest at a constitutional monarchy or a bourgeois republic."

The Ranking Jew

Rear Admiral Joseph Strauss will shortly be promoted to be admiral and appointed commander-in-chief of *our* Asiatic fleet. We believe he is the ranking Jew in the Navy today.—Chicago *Jewish Sentinel.*

Hushing It Up

Replying to a question by Sir Frederick Hall in the British House of Commons the other day, Cecil Harmsworth, under foreign secretary, said the official report concerning the Easter riots in Jerusalem was still in the hands of the new administration (Sir Herbert Samuel), and that in any event its publication was unlikely, since it would serve no useful purpose and might only revive feelings which were now happily settled. Mr. Harmsworth is a son of Lord Rothermere, owner of the *Daily Mirror* and the *Sunday Pictorial,* and a nephew of Viscount Northcliffe, owner of the *Times,* the *Daily Mail* and a score of other publications.

Erlanger Buys Taft Theater

A. E. Erlanger, one of the big chiefs among New York's Jewish theatrical magnates, has now purchased from Charles P. Taft, brother of the ex-President, owner of the *Times-Star,* a 99-year lease of the Grand Opera House, the principal theater in Cincinnati, of which Erlanger takes immediate possession. The transaction is reported as involving some five million dollars. Extensive improvements are to be made, including the erection of a sixteen-story office building over the present theater lobby.

Honoring Taft

"We shall henceforth link the name of Taft with John Reuchlin, Gotthold Ephraim Lessing, Thomas Macaulay, Zebulun Vance and other distinguished men who defied public opinion and defended the Jewish people."—Chicago *Jewish Sentinel.* For which rich reward, it would seem that the ex-President might have given a little better value for his lecture fee.

Moving Them Along

Messrs. Polny and Banoth, leading Hungarian Jews, are attacked in a Jewish paper of Vienna on the score that they have been playing into the hands of the "anti-Semites" by using relief funds received from America to aid the government in deporting wretched refugees from Eastern Galicia.

As Much a Fable

We do not say that the Jew is a fool in business but . . . . the belief of so many Gentiles that Jews are the ablest and shrewdest business men is one of the most grotesque superstitions imaginable, and it is as much a fable as the fact *(sic)* that the Jews aspire to world domination."—Chicago *Jewish Sentinel.*

Star of David

New chapters of the Red Mogen-David, a Jewish fraternal order, have been formed in various sections of Philadelphia during the past month. The red Mogen, or star, is the insignia of the Zionists, which with slight modification has been adopted by the Russian Bolshevists and is worn by soldiers of the Red Army.

Palestine Mandate

The acceptance by Great Britain of the mandate for Palestine was announced on Christmas Eve in the king's speech to the Houses of Parliament at Westminster.

Was Bethman-Holweg a Jew?

A curious example of Jewish claims is the one made recently at the time of Bethman-Holweg's death. The Jewish press claimed him as a Jew. The Cleveland *Jewish World* claims that he is the grandson of a Jewish banking family of Von Bethman of Frankfort. In Germany the claim has always been refuted as false.

Private Advices From Abroad

"There is a constant stream of American Jews passing through Berlin to Poland and Galicia. These people are agents for the movement of Jewish forces to America.

"Last week, a certain Mr. S——— came through Berlin on his way back to America after a visit to Poland. He had with him just exactly 17 Polish Jews whom he was deputed to bring to America by the jewelry firm of ——— & Company, ——— Street, Philadelphia. These 17 people are alleged relatives of this American jeweler.

"I spoke to an American ex-officer who came from Krakau last week where he had observed the American consular officials. The stream of emigration, according to his statement, is carried on under such conditions that it defies description. The American passport regulations are absolutely set aside when it comes to expediting the passage of a Jew. When the flood started last year, the consuls would, off and on, refuse a passport to a Jew, when they found that it would be absolutely contrary to the laws and their oath to maintain these laws, to grant such a passport.

"In every case of refusal, however, the consuls were later instructed by letter or cable to grant the pass, so they have by this time given up the idea of refusing anyone."

News From Jerusalem

Jewish police force very inefficient; night travel unsafe. No building being undertaken to meet the house shortage. Prices are dropping, one to 10 per cent. No work for the people, except on the roads. New arrivals forced to live in tents of which there is a scarcity. The wine-workers have gone on strike. Jerusalem is taking on a Russian aspect from the Russian and Polish Jews. On November 10 the anniversary of the Bolshevist Revolution in Russia was celebrated with more life than has been seen here since the Easter riots. There were many signs—"Long live the national proletariat; the socialistic-federative Soviet Republic in Russia; the Third Internationale; the Socialistic Land of Israel!" Religious Judaism languishes, the Socialists and Bolshevists apparently absorbing all the enthusiasm.

Picturesque Cataracts Give City Its Power

Views of the Spokane River and the great spans that bridge it

SPOKANE, "City of Sunshine and Power," occupies a definite and important place in the interior economy of the great Pacific Northwest. Located approximately midway between the crests of the Rockies and the Cascades it is the logical and de facto commercial and financial center of the Inland Empire, a sweep of 150,000 square miles of country rich in agriculture, timber, minerals, live stock and fruit. Within this area are the largest stand of white pine extant, orchards that produced more than twice as many export apples as the next largest producing state in America, the principal silver-lead mines of the world, wheat fields that yielded 43 million bushels in 1919, and ranges that support ever-increasing bands of cattle and herds of sheep.

Through the very heart of the city dashes the Spokane River. Its picturesque cataracts with their immense power potentialities unquestionably had much to do with Spokane's genesis as a community and exercised a potent influence on the city's growth and development. Already 172,000 electrical horse power has been developed with further hydro-electric enterprises in process of formation. Power is sold cheaply with the valuable accompaniment of genuinely efficient service. Electric current generated at Spokane is carried to the Coeur d'Alene mining district for the operation of its great mines, and the Chicago, Milwaukee & St. Paul Railroad hauls its transcontinental trains over the Saddle Rock Mountains with Spokane power utilized in the largest electric locomotives ever constructed.

Spokane's climate is one of its strongest recommendations. The altitude is 1,891 feet which makes for moderate temperatures—dry bracing summers, mild winters, cool nights. The city is admirably built, possesses charming residential districts and has a high percentage of single homes which has its reflex in an exceptionally low labor turnover. The park area is the largest in America in proportion to population.

Immediately adjacent to Spokane, and conveniently reached by the six transcontinental and 12 branch and interurban railroads that pass through or radiate from the city, is the "Green Summer Playground of America," a charming district of mountain lakes teeming with trout and foothills abounding in game. Spokane may be said fairly to typify the West at its best. It is a busy bustling community, hospitable and optimistic, proud of its record and confident of its brilliant future.

Take Off the Blinders

MRS. BROWNING, who was herself a keen observer and who appreciated to the utmost the beauty of life which is everywhere apparent to discerning eyes, dismayed by the lack of appreciation and shortness of vision of those around her, once gave vent to her feelings in the lines:

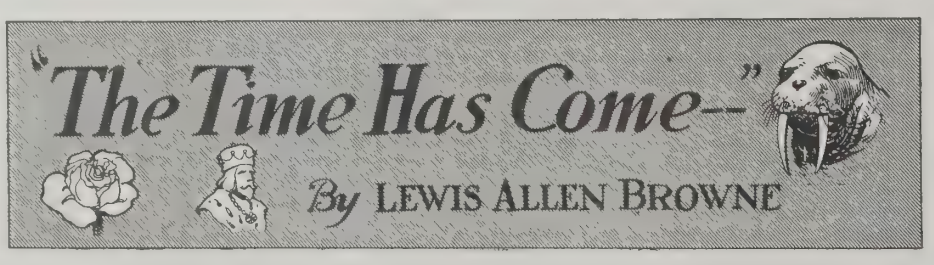
> "Earth's crammed with Heaven,
> And every common bush afire with God;
> But only he who sees takes off his shoes,
> The rest sit 'round and pluck blackberries."

The description is that of thousands of men and women today whose mental vision is blinded, whose moral sight is obscured, and whose perception has been made dull through daily contact with that which is sordid, and association with those whose visibility is of low range, and never rises above the level of their own interests and desires.

They are the people who, in the country, see nothing of the beautiful. They complain of the dust from the road which soils their shoes, and the heat of the sun which wilts them, or of the rain which brings them discomfort. The city to them means nothing beyond an aggregation of thousands who push and jostle them, a motley mob always seeking to thwart their purposes.

Get rid of the cataract which impairs your vision, oh man, oh woman, and see what a wonderful world it is in which you live! Look with open eyes at the sun, the trees, the flowers, the blue sky, the rain drops, all breathing of life and immortality! Hear in the song of the birds, and the purl of the brook and the buzz of the insects, the voice of God. Do not despise the throng which jostles you as you walk the city's streets. To your cleared vision the crowd becomes a thousand individuals, each of whom is a living being. You can see that their desires, and ambitions, and disappointments, and sorrows are the same which you yourself experience. Look into their faces and see there the reflection of God's image, and feel the throb of their emotions as they press you. If you can do this, then you are "seeing things" in the way that Mrs. Browning saw them.

"Give me a chance," said a young man, "and I'll show you what I can do." But he never did "show," for although there were opportunities all about him, he could not see them. If you would succeed be ever on the alert to see the opportunity when it comes. Tear the blinders from your eyes, young man, young woman, and see the chances for advancement which throng you daily, and are to be had for the asking. Reach out your hands and grasp them, and do not let them slip away unnoticed, or else some day there will come a time when it is too late.



John J. Ingalls in his immortal lines on Opportunity says:

> "Master of human destinies am I.
> Fame, love and fortune at my footsteps wait,
> Cities and fields I walk; I penetrate
> Deserts and seas remote, and, passing by
> Hovel, and mart, and palace, soon or late
> I knock unbidden once at every gate!
> If sleeping, wake—if feasting, rise before
> I turn away."

Cultivate the habit of seeing the things that are all around you. Take the veil from before your eyes, and look with undimmed vision upon the common things of life which are "afire with God."

Learn to brush away the mists of doubt and distrust which sometimes rise between you and the "burning bush," and obscure your sight.

If you will do this, you will experience the real joy of living, and will never again be content to "sit 'round and pluck blackberries."

To be really popular you must allow people to tell you things that you already know, as if you had never heard of them.

There are times when it is important to speak, but more times when it is most important not to speak.

Half the men fall from their high places from speaking their thoughts.

If we were as satisfied with our fortunes as we are with our judgment, what a contented old world it would be!

No couple ever married without disappointing somebody, and they are fortunate if they don't finally disappoint everybody.

The man who is down and out may get lots of sympathy—but no praise.

If you have nothing much to say you will probably make a hit on the lecture platform—provided you say it well.

Most of our sins of omission are those we didn't have opportunity to commit.

Brevity, being the soul of wit, may explain the "funny" skirts the women are wearing these days.

Money is the root of most family trees—generally somebody else's money.

Leave fatuity out of our conversation and we would be talking in monosyllables.

Half the world doesn't know how the other half lives—or care a hang!

A laugh, a sigh; a smile, a tear; a giggle, a sob; a joy, a pain; a gain, a sacrifice—that is the synthesis of Love.

A good talker can always find a job, but a good doer is paid ten times as much.

With Truth in a well, Patience on a monument and Cupid with a bow and arrow, no wonder there are so many unhappy marriages.

When you are about to complain, pause and reflect on how little heed you pay to the complaints of others.

There are many mortal goddesses—they are all mothers.

Ideals are the bull's-eyes of life that should direct our aim.

Don't you recognize that lonely old woman weeping over there in the corner? She is the woman who, not many years ago, declared she would not be bothered with children.

It's a short lane that echoes no blowout.

The lover who speaks but says nothing never faces a breach of promise suit.

A man's logic is good—but a woman's "hunch" is frequently better.

Many a so-called love match is only the meeting of a woman with wiles and a man with conceit.

A man gets on his knees to an heiress that she may put him on his feet.

Don't ignore the man who gets ahead of you. Study him with care and learn how he did it.

A committee formed of the representatives in Congress from California is holding meetings in Washington in an effort to bring about some solution of the Japanese immigration question. The members of the committee from left to right are: Representatives John E. Raker, Chas. Hiram Randall, John Arthur Elston, Julius Kahn, chairman, Henry Zenas Osborne, Clarence F. Lea, Henry Ellsworth Barbour and John I. Nolan.

Japan's Side of the California Question

By K. K. KAWAKAMI

THAT the passage of the land law at the recent election in California failed to settle the Japanese question in that state is admitted by all. It was voted because of the intense agitation that preceded the election and the newspaper support, unreasoning support, that was extended. Today it is admitted that new legislation must be approved by the people because of the fact that the treaty modifications by the Federal Government will vitiate the California law. This discussion of a question that is occupying more and more columns of space in the press of the country is written by a Japanese living in California.

THE election in California has brought into distinct relief two important facts.

First, Senator Phelan's decisive defeat has proved that anti-Japanese agitation is not so good a card in the political game as he had thought.

Second, although the anti-Japanese land law was adopted by a considerable majority, this majority was not half so large as the proponents had expected. This again proves that anti-Japanese feeling is far from universal in California.

James D. Phelan, the senior Senator from California, pinned his hope for re-election to his anti-Japanese activities. For two years he has been marshaling formidable forces arrayed against the Japanese. He has had the solid backing of the Hearst papers, with other "metropolitan" papers throwing their weight on his side of the scale. "Keep California White" was his campaign slogan. During the month or so preceding the election, the state was flooded with huge posters, all bearing those three words in large letters. In the southern part of the state, this slogan stirred the ire of the Negroes, and the Senator altered it to "Keep California American!"

And yet the Senator's catechism has failed to re-elect him. He had underestimated the intelligence of his voters, and tried to scare them with the bogie of the Japanese menace. The people of California took this performance rather as an affront to their intelligence, and rebuked the performer by voting for his Republican opponent, Samuel Shortridge. Of course, Shortridge is no friend of the Japanese, but he did not make anti-Japanism his main campaign issue.

On the eve of the election it was generally predicted that the land law would be adopted by 9 to 1. But returns on the vote, though yet incomplete, have revealed a remarkable pro-Japanese sentiment, latent in the hearts of the Californians. Six hundred and sixty-three thousand four hundred and eighty-three voted for the anti-Japanese law, and 222,086 against it. The majority is less than 3 to 1.

When California submitted the Chinese question to the vote of the people in 1879, only 880 votes were cast in favor of the Chinese. Those cast against the Chinese numbered 161,405.

The friendly sentiment toward the Japanese disclosed at the polls is little short of a miracle, considering the formidable campaign waged against the Japanese during the last two years. The Japanese were given no hearing at all. The avenue of publicity was completely closed to them. They made no attempt to present their side before the public, for they knew that such attempts were futile. It was only during the few weeks immediately preceding the election that the Japanese Association sent out a few documents, giving authentic facts on the question, and that a number of sympathetic Americans began to realize the seriousness of the situation, and, with no solicitation from us, came to our rescue.

During the week preceding the election, it was an agreeable surprise to us to see in the newspapers a series of advertisements signed by many prominent Americans, presenting strong arguments against the Alien Land Initiative Measure. In one of these arguments we notice the following expression:

"This Initiative is an affront to the American tradition of honor and fair play. Our innate sense of justice revolts against it. It should be defeated because it insults the American people, rather than because it works hardship for the Japanese."

It is also pleasant to recall that the president and professors of Stanford University published a statement against the measure. In that statement we see the following utterance:

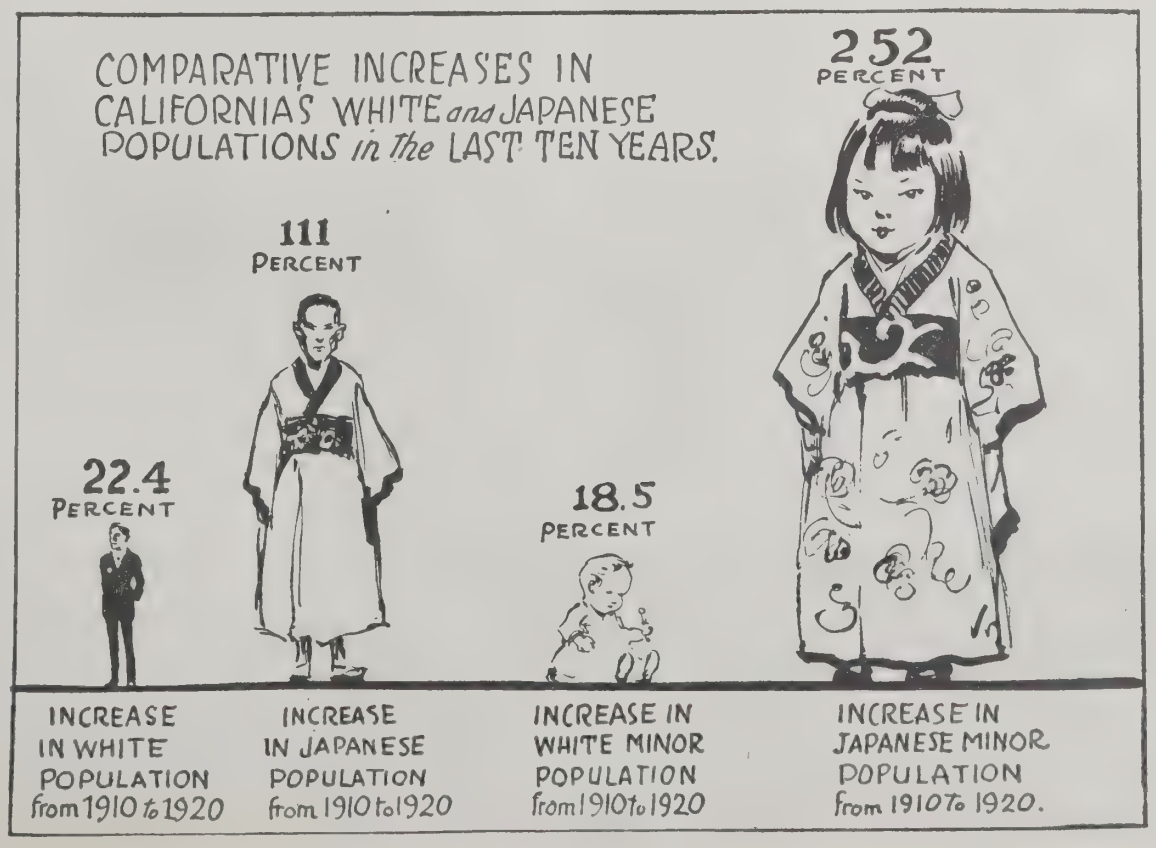
"The proposed measure is contrary to the whole spirit of our institutions. Every one must recognize that the nation has the right to scrutinize carefully every alien whom it admits to its shores. But once admitted, the nation should see that all aliens are treated with absolute fairness and impartiality."

When we read such dignified statements as these, we are convinced that the American tradition of fair play is still a vital force in American life. Our respect for Americanism and American institutions has been deepened by the experiences we have passed through in the strenuous weeks preceding the election.

At the same time, we are proud that the Japanese Association and all individual Japanese have all along maintained a dignified attitude toward Senator Phelan and other gentlemen who have been advancing the anti-Japanese movement. We have examined every document that has been sent out by the Japanese Association, and we have never come across a single remark or criticism about the Senator or his associates. The Japanese have faced the crisis with self-restraint, and acquitted themselves with dignity and calmness.

I have referred to California's attitude toward the Chinese as revealed in the popular vote of 1879, and its significance in comparison to the recent vote on the Alien Land Law directed against the Japanese. The treatment of the Chinese between the sixties and eighties of the last century was atrocious. Compared with it, the treatment of the Japanese is but a mild form of abuse. No Japanese has suffered physical attack at the hands of "hoodlums." No property owned by Japanese has been destroyed by the "riffraff" elements. Only once or twice yellow journals reported alleged cases of rough treatment meted out to the Japanese, but upon investigation such reports proved groundless, and nothing but the usual trick of newspapers to incite animosity against the Japanese. Thanks to the intelligence of the people of California, the yellow press has failed, and failed ignominiously, in its vile tricks. Everywhere the Japanese are getting along amicably with the Americans. Japanese are employing and being employed by Americans. Americans are glad to employ, and work for, Japanese. In cafés and restaurants, at hotels and theaters, there is no disposition to discriminate against the Japanese.

That no bitter anti-Japanese feeling has developed is partly due to the fact that the Japanese, in their mental outlook and temperament, are essentially Occidental, and are capable of adjusting themselves to western environments. But the stronger reason lies in the fact that, despite all the hue and cry raised by politicians and the yellow press, the Japanese are not a real menace in California. Says the American Committee of Justice, organized to oppose the Alien Land Initiative Law:



"Only 2.2 per cent of California's total population is Japanese. In 1919 more white children were born in California than all the Japanese children born here in the ten years preceding. We should not be placed in the ridiculous position of 97.8 of our population being in fear of 2.2 per cent. We would be confessing ourselves weaklings and fools if we were to think that our institutions and civilization were endangered by the presence of such a small number of Japanese, unobtrusive, law-abiding, minding their own business, and bothering nobody.

"The state board of control reports that Japanese cultivated 458,056 acres last year. California has an area of 96,617,280 acres, of which about 28,000,000 is farm land. Of this vast farm land only 1.6 per cent is cultivated by Japanese. Upon this 1.6 per cent they produce 13 per cent of California's total food output. Their produce is valued at $67,000,000, of which 35 per cent is paid landowners as rentals and 45 per cent to labor as wages. The balance of 20 per cent is the reward for Japanese tenants and contractors. The Japanese have taken up much of the worst land and made it fertile, thus helping to reduce the cost of food for the city worker."

The failure of Senator Phelan is due to the fact that he tried to make the people of California believe that the Japanese were a very grave menace. Governor Stephens, of California, made this plain when, in January, 1920, he said:

"In my opinion the present agitation in Cali-

(Concluded on page 12)

"Council Tree" with a spread of more than 125 feet.

A whole city loves this tree.

The Elms That Are Loved by a Whole City

By ARTHUR F. McCARTY

IF YOU have been fortunate enough to grow from childhood to manhood or womanhood within the shadow of some such tree as either of those pictured here, you can appreciate the value, both sentimentally and in dollars, placed on these trees by the owners of them. It might be harder for you to understand how practically the entire population of a city of 16,000 shares with the owners the love for the trees and the appreciation of their beauty.

Less than fifty years ago several hardy souls founded the town in the valley of the Smoky Hill River, in Central Kansas, not far from the geographical center of the United States, and named it Salina. It is known as a city of attractive homes, well paved streets and a fine civic spirit. And it is celebrated for its trees, especially the huge elms which are to be found in this town growing where planted by nature.

These original trees grew in scattering fashion over the town site. As the streets were paved, some of the trees had to be sacrificed, but wherever possible the original trees were saved. Houses were planned and erected to permit the trees to stand, and the citizen who is fortunate enough to have one of the original trees in his yard is a subject of envy.

The specimens pictured are all of the species *Ulmus Americanus,* or American Elm, of the spreading variety, which is without a superior as a lawn tree. The areas shaded by some of these trees are quite remarkable.

The tree called the "Council Tree" stands just inside the sidewalk line on East Iron avenue, which at that point is 100 feet in width. The tree has a span of more than 125 feet, the part over the street reaching well beyond the center. There is a legend that before the white man came to disturb their council fires the Indians resorted to this tree in large numbers, and that here the tribal councils were held. The truth of this is not vouched for, but it could easily be true, for the tree is certainly old enough and was a large tree at the time the town was surveyed.

The "Jury" tree is younger, and its span is but a little more than 100 feet, but it is a very beautiful tree and known to every person in the city. Its name does not come from any legend, but is that of the owner of the property on which it stands.

There are other specimens of these widely arched trees in Salina, probably a hundred or more, many of which equal in beauty and spread of branch the ones illustrated, but unfortunately cannot be portrayed with the camera because of buildings or other trees preventing an unobstructed view. Every one of them is an object of affection, bestowed impartially by every neighbor, and if fire or other destructive force were to menace one of them there would be an army ready instantly to fight for the tree. Some time ago a runaway automobile mounted the curb and collided with one of these trees. The car was reduced to junk, parts of it being driven into the tree nearly a foot, and the bark was stripped from a space five or six feet high and half way around the tree. The daily newspaper carried a story of the accident, but instead of featuring the damage to the costly automobile, played up the injury to the tree. A week later there was another story in the paper, describing how the tree had been wrapped and patched in an effort to save its life. The owner of the property had many telephone inquiries about the tree and how it was standing the injury; the name of the owner of the car was forgotten in twenty-four hours, but there are few persons in that whole city who would be unable to tell you in what yard the injured tree stands. Automobiles, it seems, can be replaced, but a tree that has been fifty or more years in the growing is priceless.

The Mississippi Packet Comes Back Concluded from page 3

rail lines, but as freight carriers, under the new freight schedule of the railroads, they can handle freight on long hauls at 35 to 40 per cent cheaper than the rails, and on short hauls at 20 per cent cheaper, and still make ten to fifteen per cent on the money invested.

"Yet if the romance of the passenger list is taken from the packet, there still remains that factor of romance which has helped to bring the packet back—those men, and their sons, and their sons' sons, who have been brought up on the river, to whom the packet was home and food and clothing and business and industry, and who have brought back the packet, at the first opportunity. For it was these men, and not new blood seeking a new industry, which began bringing out the steamboats which have laid tied up in many a tiny 'port' throughout the lower Mississippi Valley for the past ten, fifteen, twenty, and some nearly thirty years.

"To these old men and their sons and their grandsons, the packet has never left the streams; it has merely retired, until the time came for the revival of river transportation, and, as they have worked, some of them at uncongenial and unloved tasks, they have hoped and waited and prayed for the return of their beloved steamboats. And because commerce follows the line of least resistance, the packets have come back. The restless pioneer who came across the Alleghenies and settled in the valley of the Ohio was likewise the pioneer in water transportation in the United States. He flatboated and barged his cargoes down the Mississippi, to market at Memphis or Vicksburg or New Orleans, and then sold his flatboat or his barge and walked or rode on horseback all the return journey to his home. Often his walk was 2,000 miles back from New Orleans to his log hut in the wilderness of the western slope of these mountains, and when the steamboat came in 1812 to carry his cargoes of merchandise back, and his cargoes of produce down, this pioneer called together others of his kind and towns sprang up on the banks of the streams, all because, in the beginning, it had been easier to raft his lumber and furs and other products down the valley than to pack it back over the mountains to the markets of the Atlantic seaboard.

"The flatboat and the raft passed out, and steamboats increased by scores until the Civil War, but the blockades of this conflict broke down the lines of travel of the packets, until about 1866, when they began to revive again.

"I went to work on the river in 1869, and for the next eighteen years, these river steamboats grew in number, size and wealth until they became real floating palaces. I doubt if there ever was a stateroom on a transatlantic liner which compared in furnishings and equipment with the magnificent apartments which were called 'cabins' on these huge old packets. So large did this industry become that in 1870 there were 41 separate and distinct companies operating packets out of New Orleans on the Mississippi and its tributaries as far north as St. Louis, and 25 others operating north of St. Louis, all of which connected with the southbound lines at the Missouri port. New Orleans was then the third city—and the first port—in the United States.

"For nearly two decades—up to 1887—this fleet, numbering, if I recall it correctly, some 300 boats, made the Mississippi River one huge artery of trade, travel and communication for all its 1,200 miles from New Orleans to St. Louis. But, in 1887 came the Interstate Commerce Act, putting the balance of traffic power in the hands of the railroads, and the river fleets at once went into a decline, from which they are just now reviving. As an example of how rapidly this traffic is coming back, let me point out to you that 50 years ago, when I went up and down the river in the first 'America,' a packet of the same size and type as the one I now have, I used to get 2,000 bales of cotton a trip. This year, I will get 2,000 bales on one trip from Greenville, Arkansas, southward to New Orleans, ten times as great a load of cotton as my 'America' has carried on any one trip in the past 25 or 30 years. But passengers? Possibly you, possibly your friend or my friend, but not more than two or three. The rates are not what they used to be, and steamboat operation today is a business not a profession, a pleasure, or a gamble."

There is another difference in the packets of today from those of yesterday which Captain Cooley, being of the river, a river man, did not notice, or chose not to mention. That is, that we are getting a type of packet for every type of work to be done. In the old days, the type of the packet varied only in size, depending on the width and depth and crookedness of the streams on which it was to be operated. But shortly before Christmas the writer, in a four-day trip on a packet, met five different types of packets, virtually all of them rebuilt from old hulls which had been in operation for some years, but all re-designed, specialized packets, as it were, intended for special work.

There are the large river packets, the large excursion packets, the large freighters of the smaller rivers, bays, lakes and bayous, seldom of more than 100 tons carrying capacity; the "slaveys" among the packets, the "maids of all work," which tow barges, haul crippled schooners, carry loads of freight or may be chartered for hunting expeditions, and the little passenger packets, scarcely larger than good big motor boats, which furnish often the only connection remote dwellers in the great marsh have with civilization. But they have all come back. The packets are again on the job, with their singing firemen, their whistling exhausts, their screaming whistles, their endless stops to cut firewood from some cypress swamp, and their great ability to deliver cargo where no other form of transportation can deliver it, bayou-side in the midst of the 12,000 square miles of swamp, where live nearly 300,000 apparently contented people of the South.

Japan's Side of the California Question Concluded from page 11

fornia was inspired by candidacy for office. It is true that many worthy citizens have now allied themselves with it with laudable purpose. The fact remains, however, that the dominant factors in the movement are actuated by their desires for political preferment."

The statement was lengthy and spared no words in criticising the gentlemen who were candidates for various offices.

Between last January and the present moment the Japanese situation has undergone no change. All the essential facts about the Japanese were known to the governor eleven months ago. And yet the same governor, a Republican, made public, on the eve of the Democratic Convention in San Francisco, a lengthy letter addressed by him to Secretary of State Colby. Since then he has visited Washington and made a pilgrimage to Mr. Harding's front porch, taking pains to let the world know that he and his party were just as anti-Japanese as the Democrats.

The inwardness of California politics centering upon the Japanese question can be appreciated only by those who live here and have closely followed the tortuous course it has taken.

A significant fact in the present agitation against the Japanese is organized labor's apathy toward it. At the time of the San Francisco school incident of fifteen years ago, organized labor was the motive power of agitation. In the movement leading to the enactment of the anti-Japanese land law of 1913, organized labor played the most prominent part. But in the present movement labor has been a follower, not a leader.

This modification of attitude on the part of organized labor is mainly due to the fact that the Japanese no longer compete with American labor. The Japanese workers are getting as much as, and in some cases even more than their American fellows. Moreover, in the past several years Japanese farmers have become employers of American labor. Thus American laborers have come to know that the Japanese are considerate and generous employers.

In discussing California's anti-Japanese land bill it is pertinent to consider Japanese laws relative to the property rights of foreigners in Japan. In 1910 the Japanese Diet adopted a law extending landownership to aliens, but this law has never been sanctioned by the emperor, and remains pigeonholed. Under the existing laws, quite independently of the 1910 law, the property rights of foreigners are fairly well protected. True, they as individuals cannot own land, but corporations organized by them are permitted to own real property. Again the Civil Code of Japan allows aliens to lease land of any description for fifty years, and to hold the right of superficies for unlimited periods. Furthermore, foreigners in Japan still enjoy the benefit of perpetual lease, a peculiar prerogative established in the days of exterritoriality.

A Pen Picture of Elinor Glyn

Not the Flaming Vampire Her Writings Depict

By JOHN B. WALLACE

HOW seldom do persons whom you have never seen look like you expected them to appear—especially authors. For instance, take a story of buccaneers, pirate gold, buckets of blood and weeping victims walking a plank. You would naturally picture the writer as a big, husky, upstanding specimen of humanity with beetling brows and thews like an ox. Yet nine times out of ten he will be an anemic, pale-complexioned youth, hiding watery-blue eyes behind a pair of horn spectacles. Hints to the lovelorn, so popular in our daily papers, are only too often hacked out on a typewriter by a black-whiskered, tobacco-chewing individual who ought to be digging ditches.

Mind and matter seldom synchronize in the writing game.

Thus it was with my conception of Elinor Glyn. I had pictured her as a long, languorous creature with all the characteristics of that modern siren known in our terse patois as a vamp. Where I obtained that conception I do not know unless I thought she had incarnated herself in the heroine of "Three Weeks."

ELINOR GLYN

I found Madame Glyn to be a brisk little Englishwoman with gray-green eyes—more green than gray — and brick red hair—red not auburn—at least what I could see of it for we were out-of-doors and she had her hat on. Her manner is more French than English although she can trace her English ancestry back for many generations without a break. Her accent, however, is decidedly English.

She reminded me oddly of Becky Sharp, the clever little heroine of Thackery's masterpiece, "Vanity Fair." Not that I would imply that Madame Glyn is of the adventuress type. Far from it. She was a devoted wife for many years, her husband dying five years ago and she is the mother of two grown daughters. Her vamping has all been done in her mind and projected via her pen into her novels.

Madame Glyn is still an attractive woman but her attractiveness is rather of personality and mentality than physical pulchritude. She talks in epigrams. Her powers of observation seem to be exceptionally keen and she has no hesitancy in voicing her opinions. Perhaps that is why she is so popular as a speaker at club luncheons. Our society women like to be told the truth about themselves provided, of course, that the teller has the required social qualifications. The fact that Madame Glyn has been presented at nearly every court in Europe leaves no doubt as to her eligibility.

To the discovery that she had the gift of writing Madame Glyn ascribes the fact that she is alive today. Born on a country estate in England she was married to a neighboring country gentleman, known in England as a squire, while in her early twenties. At twenty-five she was in ill health and life held out little promise to her. She was an intimate friend of her nearest neighbor, the Countess of Warwick, of Essex. One day in rummaging through some old trunks she came across an old diary which she had written when a schoolgirl. Through her family connections she had been a constant visitor at the houses of the great and near great. Many of her impressions she had recorded in this diary. While glancing through it she suddenly conceived the idea of writing a story giving these impressions through the ingenuous eyes of an innocent schoolgirl.

The result was "The Visits of Elizabeth." She read the story to her husband and he thought it very amusing. He was a friend of the publisher of the London *World,* a weekly magazine, and one day he happened to mention that his wife had written a rather clever little story.

The publisher expressed a desire to see it.

"I'll never forget the day I received a telegram from that man saying 'Elizabeth will do,'" Madame Glyn told me. "I was lying in a hammock on the lawn reflecting on how long I would have to live. That message seemed to revive me and from that day I began to recover my health."

The story was published in the *World* as a serial but its immediate popularity caused it to be withdrawn before its completion and published in book form. It had been published anonymously and Madame Glyn had a great deal of amusement listening to the comments of her friends. They wondered who on earth could have written it as many of the anecdotes and experiences told in the story could have been known only to one who moved in the inner circle of society.

Madame Glyn knew nothing of copyright laws and failed to protect her copyright on the book. She therefore got practically nothing for it except the knowledge that she could write. Soon after its publication she went to Egypt for her health and while on this trip wrote her second book, "The Reflections of Ambroisine."

"Three Weeks," her greatest success, was her fifth book. She had always been interested in the character of the Slav, especially the Russian women. While on a visit to a friend's country house in Scotland she became attracted by the clean-cut, innocent minded appearance of a young man who was also a guest there. She pictured him under the spell of a Russian siren. The result was "Three Weeks" which took her six weeks to write and has brought her a fortune in royalties. "Three Weeks" has been translated into every known language except Spanish and still sells in the United States at the rate of more than 25,000 copies a year. Strangely enough it has also been extremely popular in Japan. "Three Weeks" also brought an invitation to the Russian court where she remained six months as a guest of the royal family, who were later murdered by the Bolsheviks. It was her sympathetic interpretation of the Slav woman that won her this honor. While at the Russian court she wrote "His Hour."

This is Madame Glyn's fourth visit to America. She likes this country very much and thinks she understands Americans much better than do most Europeans.

I found that Madame Glyn and I had one thing in common and that was a hatred for snobs. Madame Glyn thinks that most American women whom she has met are snobbish.

"The American spirit is this," she epitomized, "I am as good as you but no one beneath me in station is my equal."

She says that most American men, no matter what their walk in life, are naturally gentlemen but she believes that they allow their women to dominate them too much. Being a man, I did not dispute her. However, there are worse things than petticoat tyranny.

Although she has written a score of novels Madame Glyn seldom reads fiction. Her idea of light reading is a copy of Gibbon or Stern with an occasional dip into the classics of which the "Letters of Lucian" is her favorite.

Madame Glyn came to America, this time, under contract to a big motion picture concern for which she is to write scenarios. She is enthusiastic over the possibilities of the new medium of expression but knowing the ways and wiles of motion picture directors I fear that there will soon be a clash of that intangible yet only too real thing known as artistic temperament.

The Wood Hollow Papers

By ROBERT PAGE LINCOLN

AS I was chopping wood in the afternoon I heard twitterings in the air above me and looked up. It was a merry crew of goldfinches coming apparently from nowhere and alighting in the field to feed upon the weeds. They always seem to drop from the very clouds, even like the snowflakes themselves, with a lightning-like glimmer, and then, before you are aware of it, they are busy close to the earth picking up the seeds that make up their daily fare. For all the lamentable gloominess laid at the door of winter; for all the uncomfortable attendances that are said to rise out of the ice and snow, how then shall we interpret the presence of the goldfinch whom even winter cannot drive to cover? January days or February days at their blackest are no bar to this little fellow. His rise and dip through the air and his twitterings en route are music to the soul. One is forgiven going into rhapsodies over it. No song of hermit thrush in the summer or lyric outburst of a thousand associated harbingers in the spring or early summer can equal that one song of the goldfinch, fragrant memory as it is of the liquid music that flows from that same throat in the summer. While our wintry doors creak grimly shut, like the sound of chains and bolts being fitted into place, who shall listen and hear across the immensity of the bleak fields one happy voice, rising, rising, and then fading, rising and fading until these little ones are lost over a hill or down in a snow-covered swale? While the snows come out of the frozen North and while these heralds of its coming ride downward out of the unvanquished wastes, let us not mourn over our own petty chills and misfortunes, for here we have wintry happiness represented in the very atoms.

The bird that people know in the summer as the "wild canary," so familiar to our woods and lanes, is none other than the goldfinch as it is technically termed; yet how many people are aware of the fact that the so-called "wild canary" stays with us the year around and that in the winter it changes to another color and so escapes attention. Birds that stay through the winter change plumage color with the coming of cold weather. The goldfinch or "wild canary" is yellow in the summer with a black cap on its head. In the winter it takes to itself a sparrowy coloration, with whitish underparts, a yellow throat, and, as though it would follow the fashions, it obtains for itself a yellow winter cap.

The tree sparrow is also with us in the North in the winter. This specimen and all the other sparrows, of which there are thirty varieties in this country, belong to the finch family. The tree sparrow, *Spizella monticola,* destroys vast quantities of weed seeds, and government estimates have it that in one state alone the tree sparrows destroyed in one year close to nine hundred tons of weed seeds. Of course this is an estimate and like all estimates it must be taken on its face value. I do not know how such estimates can be made, but the system of examining the stomach contents of the birds no doubt has led to the basis for such reckonings. Thus if one bird is found to have such and such an amount of seeds in its stomach this amount is no doubt multiplied by the number of possible tree sparrows in a state, thus a daily figure of seed consumption being obtained. A well-known ornithologist has stated that a scarlet tanager has been seen to consume thirty-five gipsy moths a minute for eighteen minutes at a time. To which an exceedingly shrewd observer remarked:

"According to this estimate that is 630 gipsy moths in 18 minutes. I have never measured or weighed gipsy moths but I believe that 630 would weigh a pound and would fill two quarts. Nor have I accurate figures of size or weight of scarlet tanagers, but believe them not over two ounces in weight. Here we have, then, a two-ounce bird eating two quarts, 630 moths, each a possible three-quarter inch in length, eight times its own weight in eighteen minutes!"

The seed-consuming birds have surely not the value of the tree-working birds which destroy parasitical life with such finality, but in the wisdom of her course nature has set them to their duties and the tree-working birds to theirs. A flock of seed-consuming birds alights in a thicket of weeds and while they pick a few seeds from the tops it must also be remembered that hundreds upon thousands of seeds are scattered on the snow. These seeds attract the rays of the sun as any dark surface will that lies on the snow. Soon the seeds sink into the snow and by their own heat are preserved. In the spring they fix themselves in the earth and rise as a new generation. Unconsciously the birds sow broadcast the seeds that nature produces—that is part of the infallible Great Design. Is it a bird working among the pine cones in the forest? Where a few seeds are consumed a hundred fall to the earth below. These seeds are washed away to new places and so new pines arise to beautify the land. Does not the bluejay cleave to the shelter of the oak trees, nesting in them, staying by them, winter or summer? The oddest trait in the bluejay is its strange passion for burying acorns; thousands of them; and they never return to consume them. Men who have studied deeply cannot explain it. Then there is only one solution: the bluejays are set to plant the oak trees. We scoff at this because it appears a poetic fancy; we are blind to the working of the Great Scheme of things; rather we spend the major portion of our one-hour existence probing into gigantic theories, attempting to set them to work, forgetful of the natural processes, the avenues to which are so near to us and yet so far away!

(Continued next week)

The Eighteenth Amendment—One Year Later

By C. COURTENAY SAVAGE

WHEN three judges presiding on the Domestic Relations Board met September last at Norristown, Pennsylvania, to consider cases of desertion and non-support, they found that not a single case was listed for their attention.

The Anti-Saloon League goes on record as stating that they estimate that prohibition has reduced crime forty per cent throughout the United States.

Since prohibition has come into effect, insanity has decreased sixty per cent, according to no less an authority than the president of a Missouri sanitorium.

In New York State 6,131 physicians held Federal permits to prescribe alcoholic liquors for medicinal purposes in 1920. Less than 1,000 applied for similar privileges for 1921.

An interesting research apropos of what prohibition has done for a typical American city was carried on in Grand Rapids, Michigan, by representatives of the *Survey,* a magazine dealing with welfare. Grand Rapids is a city of 137,000 inhabitants, approximately one quarter of the population being foreign-born. Two years before national prohibition went into effect, state prohibition closed the city's one hundred and sixty saloons and 40 or 50 halls equipped with private bars. The wholesale liquor houses went out of business, and the three breweries began the manufacture of soft drinks.

The result of this, possibly coupled with the manufacturing impetus brought on by the war, has seemed to be better wages, steady employment, the decline of two great indexes of public health, tuberculosis and infant mortality; a lack of poverty, and a growing demand for recreation; coupled with an awakening value of thrift. Crime certainly decreased, for in the year 1916-17, the total number of crimes and misdemeanors numbered 2,926; in 1919-20 the number was 877.

One of the most interesting results of the survey was a study of what became of the saloons. It was found that 57 of these were now used as soft drink parlors, 37 of them being used for soft drinks only, the others having a pool or billiard parlor in connection. There were 79 stores where saloons had once flourished, now devoted to restaurants, candy stores, barber shops, four branch banks, one pawnshop, two five and ten cent stores, two drug stores, the rest being miscellaneous retail and wholesale stores. Of the 160 saloons that were closed, but nine spaces were vacant when the survey was made. Of the rest, the buildings had either been torn down, or were in the process of renovation.

Crime Record Shows Drop

ANOTHER witness in the cause of prohibition is the commissioner of public safety, of Rochester, New York, who reports crime in his city below the average, though he admits a marked increase of crime of a more serious character. He says:

"Study of the monthly police reports show, with the exception possibly of the last few weeks, a marked decrease in the number of arrests for intoxication but an increase in reports of crime of more serious character. Thefts and crimes of violence have increased here as in other sections of the country, and recent revelations of social conditions have directed attention to the part the automobile has played in sex offenses." (November 11, 1920.)

An optimistic statement is made by the head of the Chicago Humane Society. He says that since prohibition there has been a falling off of thirty-five per cent of the cases of wife-beating, family abuses and non-support, and that crime of all kinds in his city, coming under his society's attention, has decreased more than twenty-five per cent. The question has arisen on several occasions, however, as to whether or not prohibition has been the reason for this lack of domestic quarrel. Several judges have thought the high wages paid during the last three years may have been responsible for marital harmony.

The reports on petty crime, those coming in up to the last few weeks, when there seemed to be a serious disorder in the criminal world, have shown that in the small, as well as the large communities, the jails have been more or less empty during 1920.

Before the country went dry the Concord, Massachusetts, reformatory had from 800 to 1,000 inmates all the time; now they have but 382.

Prohibition was adopted by Nebraska in 1916, and a recent survey by the state board of charities discloses the fact that the poorhouse has been abandoned in all but 53 out of 93 counties in the state. Omaha, Nebraska's largest city, has but 205 indigents on its farm, and Lincoln, next in size, but 23.

In Boston, prior to prohibition, the healing clinics dealt with a large number of alcoholic and drug cases, but in the last year the alcoholic cases have dropped from sixty to six, and not a single drug addict applied for help. The Reverend Dr. Elwood Worcester declares that the dry laws have been rigidly enforced in Massachusetts, and that the effect is noticeable in every part of the state in the emptying of jails and reformatories. Insanity, induced by alcohol, has also decreased.

There is in Germantown, Pennsylvania, a noted institution called the Whosoever Gospel Mission and Rescue Home. Since prohibition went into effect, during its first year they report 1,487 applications for help as compared with 6,199 the previous year.

"These figures speak volumes for prohibition," says the mission's superintendent. "Our men have learned they can do without liquor and the larger credit for their finances and freedom belongs to prohibition. Plentiful work and good wages would not have produced their success and prosperity had the saloon been wide open. Prohibition has brought respectability among them."

In the District of Columbia crime is decreasing, according to the annual report of Charles C. Foster, general superintendent of penal institutions. During the last fiscal year only 833 prisoners were sent to the Occoquan workhouse as against 2,511 during the preceding twelve months. It is Superintendent Foster's belief that "continuous and more effective restriction of the sale of liquor, narcotics and deadly weapons will reduce crime almost to a minimum.

"No matter what the belief," he goes on to say, "it is a certainty that prohibition enforcement is something of a crime preventive and a crime cure. The record here shows it. It has reduced the population until now and then the number of prisoners resembles an assemblage responding to a call to donate money to an unpopular cause. While it has greatly reduced the working force here, it has, on the other hand, made the sun shine in many a home and put a smile on many a tear-stained face. Gloom around a workhouse because man power is lacking becomes negligible as compared to the contentment and happiness in places made desolate as a result of an unconquerable indulgence. When jails and workhouses suffer a census decrease the sum total of human happiness is on the increase."

Hospital Beds Released

FROM the Schenectady (N. Y.) jail, where 67 of 88 cells are empty, comes a very similar report, due to the "drouth," the sheriff says.

In New York City for the ten months of 1920, from January to October, 12,485 cases were handled by the sheriff's office, against 14,782 cases for the same period in 1919. And in this connection it must be remembered that in the metropolis prohibition is not—perhaps cannot be—thoroughly enforced. Liquor may still be had almost anywhere in the city, provided one has the price.

In June last, Charles L. Chute, secretary of the state of New York probation commission, gave figures showing a reduction in court cases of thirty-four per cent in seventeen large city and county courts of New York State. The opinion was almost unanimous among the probation officers that the dry law reduces court work.

Incidentally, to again quote from a New York figure, Frederick D. Green, secretary of the United Hospital Fund, claims that "thanks to prohibition, 7,000 beds have been released for the care of maternity, mental, tuberculosis and general cases. All the city's hospitals, within a month after prohibition, reported a heavy falling off of ambulance calls due to inebrity.

"Indications are," said Mr. Green, "that diseases and accidents due to alcoholism will continue to decline, that the general standard of health will thereby be raised and the duration of patients' stay in hospitals will be cut down, because an alcoholized system requires more time to throw off disease than a normal system. In this way the general usefulness and efficiency of all our hospitals will be increased."

Providence, Rhode Island, philosophizes on the economic effects of the Eighteenth Amendment. Captain Ahern says, "The mothers and children are getting the money the saloon man used to get. There is no longer any argument against prohibition." The police are prohibitionists almost to a man, for without liquor the work for policemen of all grades is "lighter and more agreeable." In the twelve months ending July 1, 1920, there were 1,883 arrests for drunkenness in Providence as against 10,175 for the previous year. All of which is ascribed by Providence police officials to the workings of prohibition.

Speaking before the Osteopath Association in Philadelphia, in November last, Dr. A. G. Hildreth, of Macon, Missouri, declared that insanity in the United States had decreased sixty per cent since alcohol has been scarce. His reason for the remarkable decrease is "that the people of the nation are leading a more quiet life and the over-exertion of the nervous system, which is caused by the drinking of alcoholic liquors, has been done away with. People are taking more care of themselves, and by total abstinence their body is kept at a normal condition.

No Increase in Drug Traffic

"ALTHOUGH there is a wave of crime sweeping over the country, this wave will subside gradually. The reason for the increase in crime is because men have not accustomed themselves to prohibition and will go out as bandits and rob and murder just to obtain money to pay the exorbitant prices asked for alcohol."

When in January, 1920, the national dry laws actually went into effect, it seemed to be the general opinion that, as it was enforced more and more stringently, the greater, in proportion, would be the number of drug addicts. But, according to Frank J. Fitzpatrick, head of the Federal Narcotic Squad of the Internal Revenue Department, drug addicts have not increased since the advent of prohibition. On the other hand, he declares that there is a marked decrease in many cities.

It was also predicted that without the laws the hotels could not exist, that many would be wiped out. This prediction has not worked out according to rule. There are more ice cream parlors, serving cakes and sandwiches, and the hotels and restaurants, the tea-room and the "dog" wagon all report big business. The people are drinking less, and eating more.

Alfred Amer, president of the Southern Interstate Hotel Association, believes that prohibition has been "of tremendous benefit" to hotel proprietors by making the operation of hotels easier, as to the handling of guests as well as employes.

There has, he claims, been a remarkable decrease in breakage, and a decided improvement in the reliability and efficiency of employes.

"In the year or more that has passed since prohibition began to go into effect," Mr. Amer explains, "hotel proprietors and managers have found the benefits of prohibition so materially real that of all the scores with whom I have talked in the past six months, not one would go back to the old days of unrestricted liquor selling, very few would care to see even the lightest of beer and wine come back, and even the most rabid proponents of liquor admit their business is much more easily conducted since John Barleycorn was laid to rest."

As to the revenue from liquor, Mr. Amer says it has been made up by "side lines" such as the barber shop, candy stand, souvenir stand sales, magazine and newspaper stands, taxi service, and Turkish baths. "The books show," he concluded, "that since September 30, 1919, these 'side issues' have returned twice as much net profit to the St. Charles Hotel, New Orleans, as was produced by the combined bar and wine and beer trade during the twelve months prior to the coming of prohibition."

Many claims are made that since "booze" became scarce the general health of the nation has undergone a marked improvement. Thus, for example, one of the great insurance companies whose policies in force total 21,770,000 reports a big drop—"almost startling"—in mortality during the past three months. From a death rate of 12 per thousand (1918) and a rate of 15.7 in the spring of 1919 (due to the influenza epidemic), the death-claim ratio during the closing months of the year fell to 8.8.

The president-emeritus of Harvard University, Dr. Charles W. Eliot, recently declared that prohibition is "in one bundle with thrift, frugality, regard for community well-being and thoughtfulness for posterity."

Dr. Eliot said, discussing drink from its social side:

"The advocates of prohibition are usually represented as ascetics or joy-killers. There is a rather common apprehension that the exclusion of alcoholic drinks will diminish cheerfulness and hilarity in all social gatherings and in general the gayety of human intercourse. It is a fact that alcoholic drinks used at any social gathering will increase laughter and other inarticulate noises in the company and will produce more boisterous merriment than 'soft drinks' will. This phenomenon results from the diminution of self-control, conscious or unconscious, which alcohol produces in the human subject. It has nothing whatever to do, however, with real pleasure or enjoyment in social intercourse.

Gangster Influence Wanes

"IT IS not a fact that total abstainers enjoy rational intercourse with their fellow beings less than those who use alcoholic drinks. They need, however, to be supplied by their hosts, or the company, with other sources of pleasure and satisfaction such as music, dancing, good acting, good talk, humor and wit. Modern civilization has much to gain by shutting out Bacchus and his devotees, but should at the same time give place and welcome to Minerva, Ceres and Diana, with all the muses and the graces."

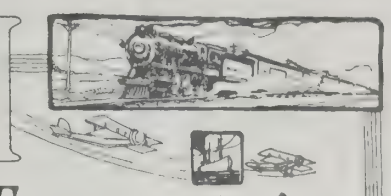
Whether one's attitude be pro or con on the question of the alcoholic liquors, it must be admitted that they have dealt a horrible blow at the youth of all countries, and if the men and women of tomorrow grow up minus the effects and temptations of strong drink, they must have been free from an influence that was not good.

"Removal of the influence of the saloon from the youth of this city," says a Chicagoan, "is already indicating an important economic effect. Hundreds of boys who were drawn into the various "gangs" fostered by contamination with the liquor traffic are being started on the way to useful and productive citizenship. In a district from which thirteen per cent of the juvenile delinquency of Chicago came last year a three-story brick building formerly occupied by a saloon and dance halls is being converted into a boys' club. Its aim, as explained by the manager, is to furnish some social life for the boys from seven to 17 who have heretofore had no wholesome outlet for their surplus energies. Some 80,000 people, he said, representing at least 15 nationalities, are crowded in this area of less than a square mile, and the boys, left to their own devices in the past, have drifted into criminal gangs. The boys' club will offer all kinds of athletic, entertainment and educational facilities."

Incidentally, another interesting note is the fact that prohibition is providing a better class of borrowers, in the opinion of the National Federation of Loan Associations. One of its members, D. S. Caffey, of St. Louis, is the authority for the statement that since the country went dry the business of loan companies had improved both in character of accounts and promptness of payments.

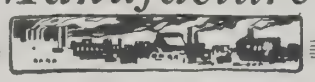
There has, too, according to the Legal Aid Society of Pittsburgh, been "a slump in lawsuits."

A representative of a newspaper of national reputation, just returned from a tour of observation through thirty-eight states, reports that the Volstead Law is widely violated, or ignored, and money assures drink in abundance.



His investigation covered seven-eighths of the United States, and disclosed the fact that "it is possible to get whisky and other intoxicants in any town in the country."

So much for the Eighteenth Amendment—one year later.



At the moment the Federal Government is losing two billions a year in taxes, plus a huge sum for enforcement. However, who can say that the law will not be enforced? One year is hardly a fair test for any national movement, and the man in the street, the employe, and the employer, men used to taking an occasional drink, will nine times out of ten admit that rather than see the return of the saloon, they prefer prohibition. Such an admission shows the non-alcoholic trend of the American mind—"one year after."

The Three Arts

Agriculture — Manufacture — Transportation

Alaska produced minerals to the value of $22,070,000 in 1920. These figures bring the grand total of the country's mineral output up to $460,000,000. The United States paid Russia $7,200,000 for Alaska.

The National Wholesale Grocers' Association has asked the Interstate Commerce Commission to fix rates which will wipe out the advantage the packers derive through shipping groceries in fast refrigerator cars.

The government has completed the field work on a survey of the effect of farm tenancy on the social life of rural communities. Twenty-five hundred farms and families, located in 20 communities, were studied. The findings are not ready for publication.

The National Chamber of Commerce estimates the shortage of houses in the United States at more than 1,250,000.

An American committee of 57 business men has been appointed to participate in the International Chamber of Commerce.

Representatives of wooden shipbuilding companies have informed the Shipping Board that unless there is a speedy settlement of all claims many companies will be forced into bankruptcy.

The Bureau of Safety and the American Railway Association will make extensive tests of automatic train control devices. The tests will be the most complete ever made under official supervision.

According to new statistics issued by the Director of Census, Florida contains 54,005 farms with a total of 5,846,693 acres of which 2,297,271 acres are classed as improved land. The value of all farm property in the state is $329,286,817. The value of the land and buildings is $280,450,504, of implements and machinery $13,551,773 and of live stock $35,284,540.

Arizona will reclaim another big desert valley. Eighty-five thousand acres in Paradise Valley will be brought under irrigation. This valley parallels Salt River Valley, in which Phoenix is located.

The Chinese Government is planning an air service between Peking and Shanghai with 80 landing grounds and three intermediate stations.

The National Consumers' League urges its members to support measures now pending in Congress for Federal regulation of the packing industry.

Reports from the agricultural sections of the country indicate that up to the early part of January weather conditions in the United States were favorable to farm operations.

The Farmers' Grain Marketing Committee of Seventeen will hold its next session in Kansas City, February 14. Reports from a number of economists will be heard.

The National Association of State Railway and Utility Commissions has presented a motion urging the Interstate Commerce Commission to set aside the order approving the consolidation of railway express companies.

Since the army introduced truck trailers in France, there is said to have been a growing demand for these adjuncts to highway transportation in many of the principal business centers of the continent.

The Iowa State Agricultural College and the United States Department of Agriculture have made an investigation of Iowa land which reveals that the price of land in many sections of Iowa is too high to justify returns. The average value of the state's farm lands increased $121 an acre between 1915 and 1920.

Iowa State College has recently completed tests which show that a wagon pulls easier when the load is placed over the rear wheels than when it is placed over the front ones. The difference in pull is said to amount to about 100 pounds.

The annual agricultural income of the state of Washington is estimated at $400,000,000, which amount represents half the total industrial income of the state.

Lady Victory, a White Leghorn owned by the Department of Agriculture, has laid 750 eggs in five years.

Road building experts are endeavoring to impress the public with the fact that the old methods of building roads no longer produce results equal to the demands for highway transportation. If the highways are to be developed to their capacity, there must be better and better highways.

Women of the state of Washington, working under the direction of the state college, canned 57 carloads of fruit, vegetables and meat in the fall of 1920.

The 1919-1920 apple crop in Australia was the greatest that orchardists there have ever known. A total of 960,110 cases, containing 401 pounds each, were exported.

The California Citrous League seeks an increase of three-quarters of a cent a pound on lemons.

Giant Water Power Development Seen

The Federal Power Commission reports that it has received 129 applications for licenses to develop water power under the terms of the Federal Water Power Act. The power developed if all these applications are granted will total more than twelve million horse power.

Applications have been made as follows:

	Number of applications	Estimated horse power
Alaska	10	69,000
Alabama	3	150,000
Arizona	6	3,613,200
Arizona and California	1	126,000
Arkansas	2	125,000
California	35	3,460,600
Connecticut and Massachusetts	1	20,000
District, Maryland and Virginia	1	50,000
Florida	1	4,000
Florida and Alabama	1	4,600
Idaho	7	119,700
Illinois	1	40,000
Minnesota	3	17,000
Mississippi	1	1,500
Missouri	3	32,000
Montana	10	506,400
New Jersey	2	205,500
New York	13	2,813,200
New York and Pennsylvania	1	206,800
North Carolina	3	5,900
Oklahoma	2	4,500
Oregon	2	385,200
Pennsylvania	1	20,000
South Dakota	1	(Transmission Line)
Utah	1	25,000
Virginia	2	68,000
Washington	12	1,081,000
West Virginia	1	30,000
Wisconsin	1	75,000
Wyoming	1	10
	129	12,259,110

Twelve million horse power would, it is claimed, furnish current sufficient to supply twenty cities like Chicago, and is forty per cent greater than the total present water power development of the United States to date.

California raises between 45 and 50 per cent of all the beans produced in the United States.

Traffic through the Panama Canal established new records during the year just passed. Tolls levied amounted to $10,295,000. More than eleven million tons of cargo were carried by the 2,814 vessels which used the passage.

In a report made to Congress the Federal Trade Commission reports: "An outstanding development in the marketing of grain in recent years has been the entry of the farmer into the elevator business as shown by the growth in the number of individual co-operative elevators organized by farmers and used by them in marketing their grain."

According to the Bureau of Markets the index figure of food prices in December was 3.6 per cent lower than the average of the past 10 years.

The selling price of farm land has increased 65 per cent in the last five years.

Thirteen hundred cars of boxed apples were frozen in shipment last year. The loss to the owners amounted to $1,000,000.

In reply to statements that the motor industry is approaching the point of "saturation," the Liberty National Bank of New York has published a study of the subject which points out that there are but 900,000 trucks and 8,000,000 motor cars in service in this country to supply the needs and wishes of 105,000,000 people.

Some conception of the effect which the slump in food prices will have on the buying power of producers may be obtained by remembering that the total value of corn, potatoes and cotton was estimated at about five billion dollars; that corn is now down more than 50 per cent, potatoes 40 per cent and cotton 50 per cent.

A boot and shoe factory which employs a large number of piece-workers permits its employes to come and go when they please so long as they finish the minimum daily stint between 7 a. m. and 5 p. m.

There has been introduced in the Minnesota legislature a bill which would compel wholesale clothiers to be licensed and to submit an annual report as to the amount of merchandise on hand or be subject to a fine of $500 to $1,000.

The Michigan Agricultural College has designed a two weeks' course of study for truck gardeners.

One of the largest and best known shirt concerns has cut the price of shirts 50 per cent.

Eight thousand telephones have been ordered for installation in Cuba this year. Five thousand were installed in 1920 and 4,500 in 1919. It is estimated that another year will find 40,000 phones in use on the island.

Yokohama, Japan, reports that thousands of cases of American footwear have been sent there by representatives of American importing firms and are being sold at bargain prices.

Traffic on the New York Barge Canal was 182,590 tons greater in 1920 than in 1919. The actual amount carried last year was $1,421,434 tons.

Chairman Benson of the Shipping Board urges operators of government vessels to give preference to American seamen even though they cannot be hired for as low wages as foreign tars.

Express companies have announced that they will attempt to raise the standard of service by inaugurating a "right-way" movement. The plan involves an educational campaign among express workers.

The first large shipments of Alberta wheat to leave for Europe by way of the Panama Canal were made early in January from Vancouver.

Reduction in ocean freight rates between Puget Sound ports and ports of the United Kingdom have been put into effect on three Pacific lines. The rates affect canned salmon, canned milk, tallow, fish, oils and lumber.

Briefly Told

In Buenos Aires there are nearly nine thousand children under 16 years of age employed at an average wage of 46 cents a day.

Because of the absence of crime in Huntington, Utah, the jail has been turned into a public library.

On February 22, two airplanes of the War Department will attempt to fly from coast to coast in 24 hours. The distance is 2,079 miles, between San Diego, California, and Jacksonville, Florida. Only two stops will be made during the flight.

It is said that Yellowstone National Park contains more geysers than are contained in the entire remainder of the earth's surface.

Motion pictures showing criminals in action have been barred in Chicago.

The wine cellar of the Waldorf-Astoria hotel in New York City is to be made over into a gymnasium.

The war reduced the French population by 4,000,000.

Philadelphia has established a separate court for dealing with bandits.

A Wichita, Kansas, minister sent his sermon to a half dozen cities recently by wireless telephone.

Mine timbers covered with a coating of magnesia cement are insured against fire.

A Nevada man while excavating for a large gasoline tank in his garage uncovered a ledge of gold quartz at a depth of six feet running $137.50 a ton.

Cotton seed was considered useless twenty years ago. Now it is the basis of a trade of three-quarters of a billion dollars.

Wireless apparatus with amplifiers will be used to transmit the voice of President Warren G. Harding to all parts of the United States and to ships at sea when he delivers his inaugural address March 4.

Asserting that the wealthy fox-hunting clubs of Philadelphia have imported foxes which have propagated so fast that thousands of dollars' worth of poultry is killed annually, the farmers in that vicinity intend to petition the legislature for action against the hunting clubs and foxes.

A seat in the New York Stock Exchange recently sold for $90,000.

The Pennsylvania State College will inaugurate a course in cooking for men beginning with the second semester, February 1.

There are 500,000 college students, about one to every 212 persons in the United States.

The French Academy of Science has proved that the age of a picture can be infallibly calculated by use of X-rays. The old masters used mineral colors which can be penetrated by the rays while modern painters use vegetable colors which are impenetrable.

Canada is discussing the possibilities of the musk ox as a source of wool. In the Arctic region, east of the Mackenzie River, millions of these animals are to be found foraging and thriving on a pasturage which no other animal but the reindeer could live on.

The cost of running the government last year amounted to $5,064,000,000, compared to $11,728,000,000 the previous year.

To save several trains of cars from destruction from fire at the winter quarters of a circus in Bridgeport, Connecticut, recently, three elephants were pressed into service. The animals quietly pushed the trains out of danger and then returned to their quarters.

Bounties paid by Montana stock growers in the last seven years for the killing of predatory animals amounted to $722,453.

The Chamber of Commerce of San Jose has adapted the motion picture to the need of impressing the people with the variety and importance of its activities and achievements during the past year.

French and Belgian military authorities are testing a super-long range gun which is estimated to be able to fire a shell two hundred miles.

Los Angeles has passed an ordinance prohibiting rentals in excess of 11 per cent of the gross investment on real estate and 16 per cent on furnishings.

A young man from a point near Harrisburg, Illinois, recently walked fifty miles to enlist in the United States Army.

The wild rubber plant is now the subject of experiments in Southern Arizona. It is hoped the ultimate result will have a decided effect in reducing the market price of rubber.

France plans to make over army material into civilian clothing to find work for 1,000,000 unemployed.

A man who recently died in Wheeling was rejected by a recruiting officer when he sought to enlist for the Civil War because of his advanced age at that time.

Ninety-seven per cent of Americans die without making a will.

Public school records indicate that at least four persons in every thousand stutter.

In Madison, Wisconsin, a motor truck delivering five hundred gallons of gasoline crashed into the curb and burst the tank. The gasoline flowed down the street and into the basement of a house where the flames from the furnace ignited the stream and following it back to the street, destroyed a motor car parked near by.

More people are killed and injured by tripping, slipping, and falling than from any other cause of accidents.

A bill has been introduced in the Senate to prohibit smoking in all government buildings in Washington.

Two herds of elk have been preying upon the farmers near Newry, Pennsylvania. A party of sportsmen under direction of a game warden are driving them back into the mountains.

Investigation has proved, it is asserted, that one in every dozen prohibition agents is open to bribe. The investigation was undertaken by the Federal prohibition agent for the division of the southeast which embraces several of the southern states.

The territory of Hawaii will produce enough motor fuel for its own needs within two years. They would also be able to supply the requirements of the army and navy forces there, should their bases of supply be cut off. Commercial manufacture of fuel alcohol from sugar molasses has been made practicable on a large scale on the island of Maui.

Reports from the American consul in Belgium show that at the end of the first nine months of 1920 about 61,775 acres out of 148,260 acres of war-swept soil had been put into condition fit for cultivation.

The gas masks used in the United States Army are useless for mine rescue work and despite the warnings issued from Washington to this effect, miners and persons engaged in mine rescue work persist in using them, in many cases with disastrous results.

Statistics of women's colleges show that for a period covering sixty years the average college girl of today is an inch taller than the college girl of 1860. Statistics also prove the modern girl is about seven pounds heavier.

A Cincinnati bank has installed a target range in the basement. Bandits will find the employes ready to receive them should they decide to visit the bank.

About 12,500,000 acres of the new Czecho-Slovak republic are given over to forest cultivation. This is approximately 30 per cent of the republic's whole area.

The Present Status of the Jewish Question

The lamentable failure of American Jewry to meet a single issue.

Under the Congressional Library Dome

The third greatest collection in the world is available, but few know of it.

Many Men of Many Minds

Kenneth MacGowan.—Of all the personal ineptitudes of the screen, none is more powerfully sinister than the exhibitor, the man who owns and manages the theaters where the photoplays meet their public. It is the exhibitor, ignorant and naïve when he is not vicious and corrupt, that accents and perpetuates every fault, banality, and vice of the photoplay producers.

Lynn Haines.—The whole world is staggering under the accumulated load of governmental mistakes. Here and everywhere the entire economic structure faces disaster, perhaps dissolution. Our civilization even seems threatened because governments have become prostituted by politics, imperialism and commercial greed.

General Robert Georges Nivelle.—France is in a practical situation. She asks no favors now of anyone; she only asks consideration such as a friend may properly expect. She asks no loans; she asks good will. She does not decline help from her friends; she begs from nobody on earth.

John J. Pershing.—Ours is not an aggressive nation. We want no territory, and we have no designs on other people. If other nations have the same attitude, it seems unreasonable not to believe that all would be willing to prove it by consenting to limit armaments. Unless some such move be made, we may well ask ourselves whether civilization does really reach a point where it begins to destroy itself, and whether we are thus doomed to go headlong down through destructive war to darkness and barbarism.

Without Aggression Armament Need Slight, Says Pershing

Edmund Gosse.—The ridiculous legend of the "frivolity" of France has been silenced forever. To become better and better acquainted with the real nature of French character and the actual conditions of French soil is to realize more and more clearly the logical seriousness of this marvelous race.

Josephus Daniels.—Unless we enter into an agreement with all the nations of the world we must be prepared to protect our great coast line and all our island possessions by a preponderance of naval strength.

Sir William Goode.—I do not wish to appear to be an alarmist, but if the Allies can hold out no prospect of means for continued existence, then I fear we must be prepared for an outbreak that would be beyond the control of any authority that might be left to Austria. It is common knowledge that the Bolsheviki have made elaborate preparations to utilize Vienna as a center of activity and propaganda.

A. P. Johnson.—Are you a man, a self-sustaining, self-rising, self-progressing man, or are you merely a weak link in the chain? Are you worth the credit you get for being a citizen, the pay you get for being a workman, the love you get for being a good father, or are you a part of the crowd which is surging to and fro and thinking because you are one among many that you are right?

Frederick A. Wallis.—The problem of the immigrant, both socially and economically, can only be met by scientific selection, intelligent distribution and broad assimilation.

General Leonard Wood.—We stand for Justice and Fair Dealing. This nation has not a predatory instinct or a thought of conquest. It has, however, a great responsibility for the maintenance, in conjunction with other nations, of Fair Dealing and in compelling respect for International Law and Order.

Aristide Briand.—Those who have been in France for many years understand that we are not a militarist nation. We have the warmest desire to be on friendly footing with the British and American nations, but there is a pact, signed at Versailles, which must be fulfilled.

David Wark Griffith.—The movie business may still be regarded as an "infant industry" and like any other popular baby everybody is trying to have something to do with bringing it up.

William George Bruce.—The experience of the world has established the fundamentals that must serve as a guide to port development and maintenance. In the recognition of these fundamentals the United States has made most splendid strides. It has had the example of the European ports, with the experience of centuries behind them, and has fully awakened to the great advantages of water intercommunications as a factor in world commerce.

Edward Hungerford.—The railroad is the servant of the land in the largest sense of the phrase. To be a good servant he must be well paid. That is fundamental. It is, again, merely the method of his paying that comes into question here; and that in turn is predicated upon the extra form and quality of service that he is expected to render.

Floyd W. Parsons.—Every American should seek to become informed of the division of ownership of the world's supplies of petroleum. In the years that are close upon us we shall need a clear understanding of the importance of the international oil situation, so that we may be prompt in taking the initiative when action is required.

Cicely Hamilton.—We cannot afford to leave idle and derelict any force that may control—however slightly—the impulse to destroy which is the natural expression of the mass-mind stirred to emotion. Half-a-dozen years of mass-emotion and mass-action have laid great parts of Europe in ruins and shaken the foundations whereon human society is builded—and the process of destruction appears likely to renew itself indefinitely.

Rear Admiral William S. Sims.—The world won't stand for another war. The world can't stand another war. And if we don't keep on nourishing the sentiment that was aroused for the Allies during the war, we are going to get into trouble. Personally, I believe in the initiative being taken by the English-speaking people.

Wayne B. Wheeler.—If liquor is on board a steamship or railroad, employes find access to it, and it increases accidents and decreases efficiency in the service. Eventually an American passenger service without liquor will outstrip the passenger service of any nation which thinks it must dispense a poison liquid to get the patronage of intelligent people.

John Barton Payne.—Our national parks are a heritage of beauty and natural wonder. We have set them aside and opened them to millions of visitors, and we have developed them to add to their beauty by making them accessible. It is not right that in the interests of a dubious utility we should risk the impairment of national lands which are the common property of the American people. Our national policy should be one of guarded and guarding opposition to the exploitation of these wonder lands.

Payne Urges That National Parks Be Carefully Guarded

John D. Guthrie.—The National Forests of Alaska are playing an increasingly important rôle in the development of that rich storehouse of the nation. Within a few years they will probably play the leading rôle. The timber resources of the Tongass and Chugach forests have served local development ever since the administration of these forests was taken over by the Forest Service in 1905.

C. F. Bley.—Our ancestors, the pioneers of the country, planted forest or shade trees when there was scarcely an argument for their planting—when they were hemmed in and surrounded by virgin forest. Today we are enjoying the fruits of their devotion, wisdom and forethought. Shall we do less—when there is so much more need—for the rising generations and for those yet unborn?

F. B. De Berard.—The condition of insufficient opportunities to ambitious men is inherent in all government departments. The opportunities are circumscribed, falling short of those offered in private organizations because of the rules and regulations which hamper the executives or the officials of the governmental organization from advancing men with a free hand.

Sisley Huddleston.—Conscription is a terrible thing for the individual. It is fatal for the nation, in present circumstances, to keep more than three-quarters of a million strong men from producing, to feed and to clothe so many idlers.

Levin L. Schucking.—German militarism has been a stream powerful enough to inundate nearly the whole of Europe. Who is foolish enough to think that it would disappear in a space of two years? The question is not whether anything of it is left, but if its sources are dry; and there is no doubt that they are drying up fast.

A. Lawrence Lowell.—The real desire for high scholarship depends upon the attitude of the alumni and the public. If the object of college is preparation for life by education, excellence therein ought to be better than mediocrity; but this the public fails to understand.

Honorable Arthur Meighen.—Never in the history of Canada has there been greater restriction on immigration than there is at the present time.

Gifford Pinchot.—In the matter of our supplies of forest products, we Americans are faced by a set of facts and a problem which, in gravity and far-reaching control over our immediate and remoter future, take their place fairly alongside the issues which center about the League of Nations. The essential fact is that we are not only destroying our forest supplies far more rapidly than they are being reproduced, but also—what is much more to the point—that we are using up the productive capacity of our forest lands. Not only is there less wood year by year and day by day in the United States, but there is less land growing wood. We are living beyond our income and destroying our invested capital at the same time.

Less Wood, Less Land Growing Wood, as Years Go On

Colonel Cyrus S. Radford, U. S. M. C.—This country is going through a period of deflation exactly in proportion to the inflation. Had the war been financed on a basis of the prices of raw material and labor existing in the spring of 1917, a great deal of the present deflation would have been avoided, and I believe I state it conservatively when I say that fully five billions of dollars would have been saved to the taxpayers.

William Butterworth.—If the attempt of the railway brotherhoods to impose national boards of adjustment upon the carriers is successful, the effect upon industry will be all-enveloping. It will mean the closed shop for all the railroads, as this is the goal of the brotherhood leaders.

William McClellan.—Certainly Europe needs all of her man power, and no clear-thinking American will even hope that the men and women of Europe will be willing to forsake wantonly their natives lands for the loaves and fishes which may possibly be for their taking in America.

Roger H. Williams.—When the public becomes convinced that business is giving it the advantage of falling prices just as readily as it took advantage of rising prices, public confidence will be reassured and buying stimulated.

John Foord.—In regarding China and the Chinese close at hand, the impression grows on the open-minded observer that we should make better headway in our efforts to help them if we brought to the business less of the consciousness of superiority.

Dr. Pearce Bailey, M. D.—As a student of Kraepelin, the most scientific and original of alcohol's enemies, I learned, years ago, how indisputable are the proofs, experimental and others, which show that alcohol, even in small quantities, impairs temporarily the finer intellectual qualities.

Herbert L. Stewart.—It is a fate of almost every original man to launch ideas whose merit is at first derided, whose scope is afterward exaggerated, and to which, when scorn and panegyric have worn themselves out, a calmer criticism is in the end forced to return.

The Latter-Day Lloyd George

By GEORGE F. KEARNEY

THERE is gradually forming in England a coalition against the Lloyd George Government. The issues are personal. As the champion of the rights of the English lower classes, Lloyd George had the backing of a huge, but then inarticulate majority. Now, however, he has passed through the camps, first of the Radicals, then the Liberals; the post-war Lloyd George evolves as a Conservative and even an Imperialist of the old order. The workingman now speaks of him in as angry a frame of mind as did the members of the House of Lords in 1910 when he crushed their power with his budget. The conservative elements have welcomed him, certainly, but only on grounds of expediency, and with little enthusiasm.

If Lloyd George were still the Welsh solicitor of Llanystmdwy fighting the landed gentry in the court room, or the Liberal M. P. from Carnarvon Boroughs, opposing the Boer War, or the chancellor of the exchequer, or even the minister of munitions, in wartime, or demanding old age pensions, the English people would be hailing him still as the prophet to lead them out of their present bewilderment. In all those phases of his career he extended hope to a weary empire. When, however, he appears in a rôle of Joshua, commanding the sun to stand still during an indefinite period until his diplomatic battles are won, his armies are depleted by desertions.

It is interesting to note the effect that the latter-day philosophy of Lloyd George has on his face. In those days before the war his face was an interesting study of a man with a soul on fire. His eyes burned like fiery coals while nowadays all light has disappeared from his dull eyes. His smile was once so contagious; now it is cynical and there are ugly lines around his mouth. He carries himself arrogantly, and the once un-self-conscious Lloyd George has now all the little mannerisms of an actor courting applause on his entrances and exits. From the latter-day Lloyd George the English people are turning in search of a new leader.

Lloyd George is the one man in all England who is most keenly aware of his decline in power. He has adroitly prepared his party for all emergencies, and every move is one, now, of self-preservation. By skillful manipulation he has fused all the leading elements of British political life under his leadership. Were he a prime minister in America, he would have scrambled both the Republican and Democratic parties into one coalition and then sat back with a challenge to, for instance, the Non-Partisan League to duplicate the strength of his political machine. By a careful system of patronage and by a liberal distribution of peerages he has checkmated opposition in his own ranks. He has been particularly careful that his Liberals shall not set themselves against his Conservatives lest a separation of his forces leave him a leader in neither camp.

His opposition, then, comes only from those who have deserted his coalition government for widely different reasons. Men like the two Cecil brothers, Lord Robert and Lord Hugh, lead a small group who oppose the Lloyd George policies on ethical grounds. The Cecils represent the passing race of Englishmen who cherish most the traditional attitude of John Bull as the gentleman among nations. Lord Robert sees in the League of Nations the playing of the game of world politics according to sportsmanlike rules.

Then there is a group of young Liberals, tolerating the leadership of Herbert Asquith, the ex-prime minister, who care little for England's traditional attitude but who are devoted more to a progressive school of English political thought for the development of a modernized England with a more sensitive system of representation and an extension, rather than a curtailment, of parliamentary powers. In this group one finds the younger ex-service men such as Captain Weywood Benn and Commander Kenworthy. For the present Mr. Asquith leads this faction but they are dissatisfied with their weary leader for he does not typify their progressive spirit. However, Lloyd George makes it a point to appear in the House of Commons whenever either Mr. Asquith or Lord Robert Cecil is scheduled to speak, for he still considers them his most formidable rivals, worthy of his closest study.

Lloyd George's chief opposition, however, comes from the British Labor party. They, too, have been clever in forming an unscramblable coalition to further their radical policies. The Labor party has within its folds the original Labor party movement, the Independent Labor party and the British Socialist party. The structure for their organization is the highly organized trade union movement to which they are rapidly attracting the more radical elements of the co-operative movement. They are even contemplating the admission of the newly-formed Communist party of Great Britain that takes its orders from the Moscow International. Their opposition to the Lloyd George policies is a formidable one and the seventy Labor M. P.'s in Parliament, headed by the Right Honorable J. R. Clynes, who was the minister of food in the war cabinet of Mr. Lloyd George, puts up a bold front.

To the British Labor party many otherwise Liberals have drifted, more because of their active opposition to Lloyd George than for their interest in socialistic aims of the Labor party. Thus the party finds Colonel Josiah Wegwood, a high-minded Liberal who could never be content under Mr. Asquith and who despises Lloyd George, a newcomer to its ranks. The Labor party has a strong faction within it which is at odds with the radical elements who favor the use of "Direct Action" and revolution to gain their ends. Were the political parties in England aligned differently, this conservative element would not be in the Labor party and their departure would divorce some of the support the Labor party now receives from the middle classes.

Thus the continuance of the Coalition Government strengthens the hand of the British Labor party, and gives it a false prominence as the most active opposition to Mr. Lloyd George. It is interesting to see how self-assurant the Labor party has become. They have established headquarters in fashionable Eccleston Square, near Westminster, with all the air of a party coming into power. One of the leaders, J. H. Thomas, president of the National Union of Railway Workers, has recently produced a book with the bland title, "When Labor Rules," in which he outlines what the British Labor party will do when it controls the government. Already there exists a three-cornered rivalry between J. H. Thomas, J. R. Clynes and Arthur Henderson as to who will be the Labor party's first prime minister. The average Englishman is inclined to believe that ultimately this party will take over the reins of government in England, and many of their opponents feel that it is perhaps a wise policy to allow them to do so, in the belief that governmental responsibility will tame their more radical theories.

The success of the British Labor party would be inevitable, at the present time, if the Lloyd George cabinet committed a diplomatic blunder that would plunge England into another war. The Laborites see in the failure of Lloyd George's present policy in Ireland and Mesopotamia a chance for their success, for the country is weary of the Irish problem and very critical of England's huge expenditures in "Mespot." On the other hand, the British Labor party has never appealed to the middle-class Englishman who has the greatest voting strength in England so that the success of the Labor party without the full support of the middle class would be probably temporary.

In the old days Lloyd George's strength lay in his power over the middle class. He was their greatest advocate, he talked their language and understood their political aspirations. The upper class reviled him but it was the vote of the little shopkeeper and his assistants that kept him in power. In Lloyd George's early career the laboring man also looked upon him as his friend and it has been very difficult for the agitators to break the faith the workingman had in Lloyd George's policies. Nowadays, the laboring man sees in Lloyd George an outspoken opponent and the middle classes feel that in him they have lost an advocate. Yet success in English policies of today can be gained only in the manner in which Lloyd George achieved it, by an assiduous cultivation of the confidence of the English middle class. Thus by evolving into a Conservative Lloyd George has cut himself loose from his lifelong constituency.

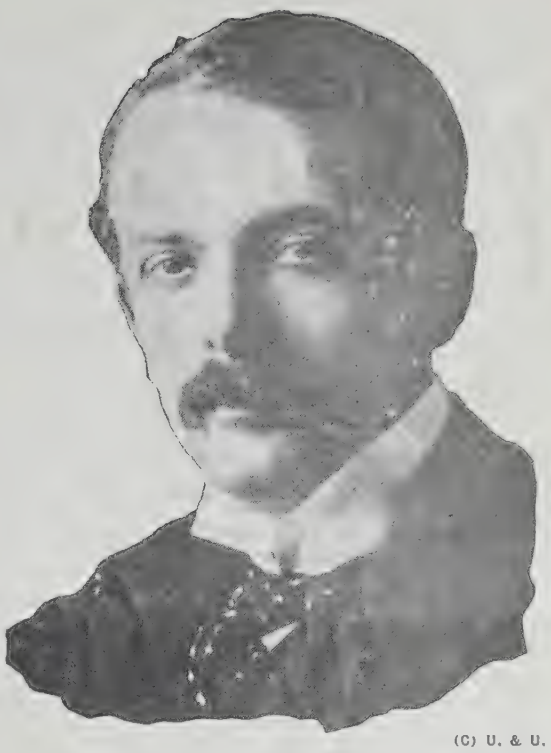
History will probably give the credit to Mr. Lloyd George for the assertion of the rights of the lower classes in English politics as opposed to the domination of the landed gentry. In the Welsh town of his birth the young Lloyd George fretted under the benevolent feudalism which required the villagers to vote for the candidates of the landowners of the neighborhood or be turned out of their cottages. His uncle, Richard Lloyd, was a shoemaker with a property of his own which allowed him to be the only Liberal voter in Llanystmdwy. It was this uncle who supplied the money for Lloyd George's law education and his hatred for the servitude exacted by the propertied class.

The young solicitor's early cases were mostly those in defense of a poor villager who took a rabbit from the game preserves of the rich. He soon realized that a man who took fish from prohibited waters was often a good deal more harshly adjudged than the drunken brute who beat his wife in some desperate fight. He differed from his associates by his lack of deference for the bench which he frequently charged with unfairness.

The story is told by Frank Dilnot of one case in which he worsted a court of judges by the exercise of sheer impudence. He was defending four men arrested for poaching which was looked upon by the presiding magistrates, all of them local celebrities, as a deadly sin. Lloyd George put in a plea that the court had no jurisdiction in the matter. In response the chairman responded grandiloquently that such a point must be decided by a higher court.

"Yes, sir," said Lloyd George, "and in a perfectly just and unbiased court."

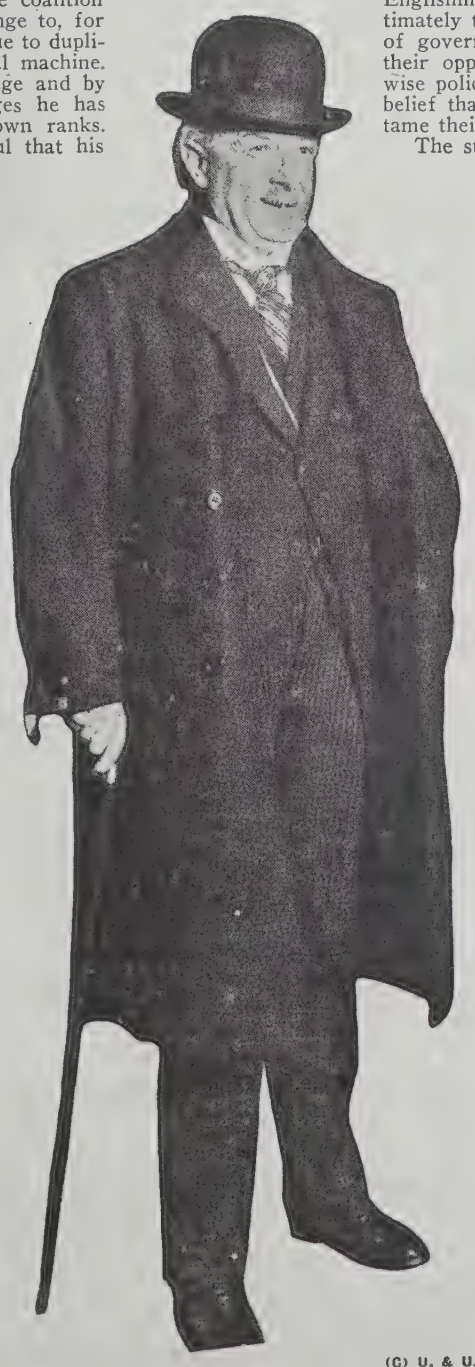
The remark created a sensation, and the presiding magistrate retired from the bench when the calm solicitor made the remark personal to him. A second magistrate withdrew as a protest against this unheard-of insult to his associate. A third magistrate remarked that he could not proceed with the case until Lloyd George apologized.



"I am glad to hear it," said Lloyd George imperturbably. Promptly another magistrate went out. One of the few justices remaining repeated the demand for an apology. Instead of apologizing Lloyd George replied, "I shall not withdraw anything."

This was really too much. All the magistrates went out. What happened, however, when the magistrates got together outside the court room can only be guessed. They must have had a painful discussion among themselves, because presently four of them came in and rather meekly said they would try the case.

Just this sort of fighting spirit, graced with stark originality, characterized all the struggles for the rights of the lower classes. Another story that gave him his first real prominence in Wales is worth telling. In a village at the foot of Snowdon an old quarryman died who expressed the wish to be buried in the graveyard of the Church of England. The clergyman would not consent to the Nonconformist rites being performed if the old man was placed beside his daughter's grave, but he yielded sufficiently to allow him a grave in a remote portion of the churchyard reserved for unknown persons and for suicides. This decision struck at the hearts of the Welsh people, who are Nonconformists, and who look upon the Church of England as the religion of the English upper classes.



The young solicitor's heart leaped to this case and he advised his clients to take the coffin into the churchyard by force, if necessary, and dig the grave for the old man by the side of his daughter. Lloyd George was present at the burial and then insisted that the case, when decided against him in a Welsh court, should be retried before the lord chief justice in London. The jury in England's capital reversed the decision of the country court judge and Lloyd George, then twenty-five years old, was known throughout Wales and England as a champion of the rights of the common man.

His next appeal for public attention was as an advocate of church disestablishment in Wales—that is to say, the separation of the English Church from state support and state endowment in view of the fact that the majority of the people were Nonconformists. It is interesting to remember that the Lloyd George of his youth actually headed a movement in Wales similar to the Sinn Fein movement. *(Concluded on page 12)*

The Eighteenth Amendment

THE Eighteenth Amendment has been in force for one year, and while there are literally thousands ready to proclaim it a failure, yet it is significant that no movement which fosters the return of the saloon or of the indiscriminate sale of intoxicants is able to gather headway.

If one confines his reading to the New York press he is very likely to become imbued with the idea that prohibition has been an utter failure in America. These newspapers say that it is and declare it will continue to be a failure. They admit complacently that they do not believe the laws regarding liquor will ever be enforced and in their comments on the subject and the encouragement which they give the lawbreakers make it very evident that they hope this lawlessness will prove to be such a problem that the United States will surrender in disgust to the criminal interests.

On the other hand, one may find in the smaller newspapers of the country the chapters of a far different story. From reading these it becomes evident that whereas all New York sees is the violation of the law, there are other parts of the United States which find that prohibition has brought many blessings.

No one, we think, will maintain that the law is perfectly administered or that it is being religiously kept by the public. Yet such a situation is not to be looked upon as proof that prohibition cannot succeed. It but parallels the history of the states which wiped out the liquor traffic years ago. These states did not find the enforcement of the law easy; some of them struggled for several years before they drove the bootleggers and the whisky runners to cover. Yet at no time during this period were the citizens willing to admit that prohibition was a failure. They found plenty of evidence to prove that it was a success.

Those who think that the United States is going to admit its inability to enforce its laws; those who believe that this great, proud country will knuckle to the dictates of the whisky ring and its followers from the underworld, may as well go to the foot of the class. They are hopeless.

Don't Let It Pile Up

NEWS from Washington brings the information that supply bills are not so far advanced as might be and that there are indications of another bill jam in Congress.

It is a habit with Congress to allow legislation to pile up until the last minute and then to rush it through with scant debate and only passing scrutiny. But it is a bad habit and it should be corrected.

Sometimes the jam is artificial. One of the worst of this type was created during the closing days of the last season of Congress when in the conflict between President Wilson and the Senate, the latter held up the general deficiency bill, the army and naval bill and the sundry civil service, agricultural, Indian, water power, oil leasing and immigration bills.

The purpose at that time was to force an extra session of Congress so that the Republican party, which had been returned to control at the last elections, would be in a stragetic position to fight Mr. Wilson's efforts to promote America's entrance into the League of Nations. Even those who sympathized with the Senate in its determination to oppose Mr. Wilson felt that it was taking the wrong tactics in holding necessary legislation. But the Senate went through with its plans regardless of criticism.

It is impossible to justify another such jam, or anything approaching it, on any grounds at this session. By earnest application Congress can winnow the wheat from the chaff and give necessary legislation the proper amount of attention. The time to begin, however, is now, and not two or three weeks from now. If Congress will do this there need be no such thing as a legislative jam.

Flags of the Past

WHEN in his Atlanta statement President-elect Harding called for the burial of all ancient grudges and the final wiping out of all section lines he was speaking to the North as much as to the South.

The present generation may not appreciate his remarks for it has well-nigh forgotten the issue which split this country and brought about years of terrible civil strife, but the older generation will understand. The waving of the red flag of sectional feeling is no longer a popular pastime in politics, but the incidents of 1861-1865 continue to rankle in many hearts. One of the traces of this sentiment is found in the museums of many states where battle flags captured from "Yank" or "Rebel" foes are displayed.

There have been spasmodic efforts made for years in favor of the return of these flags. Most of them have failed, yet what could be finer than a return of these tattered, faded but glorious emblems of the past to their original owners, North and South.

The thinning ranks of Blue and Gray are marching toward their last bivouacs. What act could be more gracious than for these enemies of old to perform the supreme act of courtesy and forgiveness; what tradition can they leave America that will be so priceless as the years advance?

Be a Gloom Chaser

SOCIETIES have recently been formed in the South and Middle West under the somewhat formidable name of "Noble Order of Gloom Chasers." The organization was first started among the employes of industrial plants, wholesale and retail houses and those engaged in clerical work, but the movement has now spread until it embraces almost every line of endeavor.

The object is to preach optimism at all times. The dues, it is stated, are "one smile a day," and each member is required to take the following obligation:

"I smilingly agree to support actively the constitution and by-laws, the purpose and intent of the Noble Order of Gloom Chasers, in letter and spirit, until gloom is banished. Old Man Gloom shall never enter my office or workroom again, so help me Gloom Chasers. I am a Gloom Chaser until death do us part."

It is a great thing to be a chaser of gloom. There can be no greater ambition than to make people happy. There is too much that is drab and doleful and melancholy in this world, at the present time. There are too many heartaches and streaming eyes and pitiful faces and thin, pleading hands. There are too many people who, for some unaccountable reason, make it their business to spread the thought of gloom and melancholy among their fellow beings instead of letting in the sunshine. The Noble Order of Gloom Chasers is a great institution, and its rapid spread throughout the country is an indication that the people want sunshine instead of gloom.

But you do not have to be a member of the N. O. G. C. to be a gloom chaser. Whether you belong to that organization or not you can do your share to help push the clouds away. Every one can get up in the morning with a smile, which not only will radiate throughout the day to their own good but to the benefit of all those they meet.

"Mirth is God's medicine," says a noted writer. "Everybody ought to bathe in it. Grim care, moroseness, anxiety, all the rust of life, ought to be scoured off by the oil of mirth. It is better than emery. Every man ought to rub himself with it. A man without mirth is like a wagon without springs, but a man who laughs and causes others to laugh, even though the days are dark and the causes for laughter are few, is like a chariot with springs in which one may ride over the rough roads and feel nothing but a pleasant motion."

The man or men who originated the N. O. G. C. are public benefactors. If there is such an order in your town by all means join it. If there isn't, start one, and if you cannot find enough people who would like to look upon the bright side of things instead of the dark, just appoint yourself the official Gloom Chaser of your locality, and begin today to push the clouds away.

Great Navies and Their Cost

WHILE Congress and the country are discussing the advisability of the United States making a proposal for a Naval Holiday among the world powers, there comes from government sources the news that the Panama Canal is not large enough to accommodate the next great dreadnoughts and that we must either limit the size of our fighting craft or send them around South America when we wish to shift them between our two seacoasts.

Battleships now being built are 105 feet in width and the Panama Canal is but five feet wider. So that if our experts cling to the theory of the big gun ship, as they show every evidence of doing, then the next ships of this class will be even larger than those building today. Manifestly, it will be absurd to build a navy which cannot pass from ocean to ocean via the Isthmus. To do so would mean the loss of the flexibility wherein lies much of our present strength and would present a situation which an enemy would pay a heavy price to accomplish—the division of our fleet.

Thus there is brought home to the public a lesson in naval costs of which experts have been long aware; namely, that the costs of greater ships do not cease with the initial cost of the vessels themselves. Bigger ships mean bigger yards, larger drydocks, deeper harbors, and increased overhead expenses. To say that whereas our first great battleship, built in 1910, cost $6,795,000 and battleships planned in 1920 cost $35,000,000, tells only part of the story. One gets a much more accurate idea by studying the record of naval appropriations and noting that while in 1910 our total expenditure on our navy was $100,336,000, Congress this year was asked for $695,763,767 to maintain our naval program.

The country, while studying the question of an agreement to eliminate competitive naval building programs, has received a timely and first-class illustration of the burden which will be lifted from the backs of the people of the world by the adoption of such a course. It is an illustration which we will do well to ponder, for there is much significance in its lesson. If we must build a second canal across the Isthmus of Panama, paying millions of dollars for the right to the land and perhaps a billion or more for the construction of the passageway, where else can our expenditures lead us except into a slough of overwhelming national debt?

Happily for the well-being of the world, present indications are propitious for an agreement between the United States, Great Britain and Japan. Certainly the public sentiment of these countries, if correctly expressed by the press, favors such an understanding. There are, of course, those who would have us believe we are being led into a trap. But their arguments do not impress one as being entirely disinterested. So long as our navy is the equal of any in the world, it is hard to see where a great navy will constitute any more protection than a small one.

Our Canadian Market

PROMISES by members of Congress to stop the importations of Canadian wheat by a tariff of 50 cents a bushel have resulted in an informal warning being delivered by our neighbor to the effect that if such a step is taken she will retaliate by placing a prohibitory tariff on American manufactured goods.

"What is sauce for the goose is sauce for the gander," and American Congressmen might have saved themselves the humiliation of this checkmate by considering Canada's position as a United States market before they talked so loosely of restricting her grain shipments to this country.

The Dominion of Canada is the best customer on our books. More than that, she will continue to be our best customer for many years to come. She came out of the World War with an indebtedness as small as her glory was great. Out of her enormous resources she will soon pay off this obligation and be able to devote her entire strength to internal development.

To lose this market would be to deal American business a knockdown blow and the loss would be so much greater than any gain accruing from the protection of our wheat that the policy which promoted such a move could fairly be dubbed "financial suicide."

Is it impossible to consider reciprocity with Canada instead of planning a tariff battle? And if so, why?

Mr. Ford's Page

STRONG efforts have been made to fasten upon the public mind the belief that newness and change spell progress. A state of mind has been generated in which the mere statement, "Oh, that is the way they did it years ago," is considered sufficient to condemn anything. A fever of newness has been everywhere confused with the spirit of progress.

For many years the learned men who were supposed to know more than anyone else about social tendencies, were of the opinion that there were mysterious seasons and wind currents in human life, and that these accounted for almost everything, but that these seasons were as unalterable and these wind currents as uncontrollable as those of the natural world.

This idea has largely passed away. Most of the manifestations which we see in human life today have been started and promoted by people who know exactly what they want and how to get it. Many of the so-called "social tendencies" are just as much invented and controlled by human wills as is the organization of a grocery store or an oil stock company.

Last year men wore hats of a certain color, a certain shape, a certain material. One year the tone is brown, the next year green. One year the material is velour, the next year felt. One year a slouchy, rakish form is affected, the next year a shape at once free and neat.

Why green hats last year? Was it just an unexplainable fancy of the public that it wanted the color green to predominate that year? Of course not. The public had nothing to say until the hats came on the market. And those who placed the hats on the market had determined a year before what the people should wear. It was a promotion scheme. If you are in the right circles it is possible for you to get a pretty accurate idea of what the crowds on our streets will look like for several years in the future. These are matters of engineering, not of free taste and tendency.

The reasons, of course, are commercial. Hats are no better than they ever were; materially they are not as good, except when special prices are paid. The purpose is that a man shall buy several hats a year—four or five. It is not planned that any of them shall last over the year. In case, however, the *quality* does outlast the year, the *style* is changed, and that, of course, with people who are easily influenced, puts a perfectly good hat out of commission.

So that the basis of more than one line of business, involving vast quantities of material and human energy, is built not upon the durability of that material and the serviceability of that labor, but only upon the decree of some interested parties that this is "old" and that is "new."

Next to the fiction that gold is wealth, this fiction of "style" is one of the most potent devices for robbing the public purse. Both fictions originated with and are propagated by the same groups and for the same purposes.

These remarks are only illustrative of what now follows: There is just as deliberate a plan to flood the popular mind with changed ideas, and thus bring it into a condition where it will not think anything that is not "new," and where it can easily be led away from any truth that may perchance be labelled "old."

This course is most successful among those who do not think—and whether these are a majority or a minority is left to the reader's own observation and judgment.

The effect, however, is harmful, and in time will prove ruinous. The jack-in-the-box thinker is not impressive simply because his utterance belongs to today instead of yesterday. Everything we have is yesterday's, even to the bread we eat—which is literally last year's; and even to the political ideals we share—which are literally last century's, and earlier. We are not such "smart folks" as we think we are. The world today is full of the sound of crashing failures built on fresh, upstart theories. The trouble with us today is that we have been unfaithful to the White Man's traditions and privileges. We have permitted a corrupt orientalism to overspread us, sapping our courage and demoralizing our ideals. There has always been a *White Man's Code*, and we have failed to follow it. It is natural for those outside the White Man's tradition to invent their destructive devices and ideas, but it is unnatural for the White Man to fall an easy victim to them.

Capital and labor are apart today, in spite of the natural tendency of the White Man's Code to bring them together, because an oriental idea has been thrust in between them for the poisoning of both.

The White Man's Code has always been to "do things"; the accomplishment of useful results is his highest satisfaction. For that reason the White Man has been throughout history preeminently the Doer. But an orientalism has crept in under cover of a social discovery, which has proved progressively destructive of everything it has touched—the professions, management and industries.

Industrial leaders have been poisoned to the extent that some of them look on their industries as "money makers," instead of plow-makers, or chair-makers, or clothing-makers. That is the new code: "Get the money." If you can get the money quicker by destroying the business, then destroy the business!

Professional life has also been infected with the same idea. Lawyers once had clients and doctors patients: now they have "customers." It is a sad drop, but it is precisely the condition desired by the orientalists who are busy injecting "new ideas" into the public mind today.

In industry, the man who still takes pride in his day's work, who really looks for satisfaction in the labor of his hands, is rated by his fellows as a "boob." He is a "back number." Even the American boy coming into life no longer believes that merit counts for anything; he is inoculated by the oriental virus which causes him to pull back, remain sullen and stupid, and give as little as he can.

At Ellis Island where formerly the immigrant used to come with shining eyes and hopeful heart, what do we now see? A horde of people who have been systematically educated beforehand in the thought that the United States is "a capitalistic country," not to be enjoyed but to be destroyed; and the very first literature put into their hands on American soil conveys the same idea. We read a great many touching stories in the fiction papers about the hopefulness and longing of the immigrant. The immigrants we have been getting for several years have no hopes nor dreams: they have a *program*.

All of these things come from the same source—a subtle orientalism that is breaking down the rugged directness of the White Man's Code.

We ought to go back to it. The type that made this country is still here, but its backbone needs stiffening. It needs to hear the call of its own race. It needs to seal its ears against the false cry of "Peace, Peace, when there is no peace." That which we used to recite in the village school—*"Eternal Vigilance Is the Price of Liberty,"* is more than a saying, it is a Truth; and its truth is being proved now, when Liberty is slipping away because of our lack of vigilance, not only, but our *impatience with anything that requires vigilance*.

The White Man's Code has three main points: Square Dealing; Fear of God and Absolute Fearlessness of Man; Unrelenting Vigilance.

These three points, if practiced today, would cleanse our country of every lurking foe. And the practice of the last point would keep it clean.

SEPARATE the ideas which constitute your mind-grist, and see how many of them are consistent with the White Man's Code. The enemy has slipped in a great many evil seeds, which have sprung up in American thought, and have borne poisonous fruit. Have you allowed any to grow in your mind? If you have, you are an outpost for the enemy of every nation that is founded on the White Man's Code. According to this Code a man must be Straight, Fearless of any man, Vigilant. When he fights, it is the enemy, and not his own kind. The enemy has been too successful in his constant effort to plant enmity among White Men themselves. "Divide and Rule," is the enemy's motto. "Together We Stand," is the White Man's pledge.

Overalls, Bloomers and the "New Freedom"

By UTHAI V. WILCOX

JUST across the street there is a modern public school. The building and grounds cover the entire block. It is a well-kept school in a community that takes pride in its progressiveness. There are shade trees in the yard, modern steel swings, slides, teeters, and all the expensive playground equipment that indulgent taxpayers could provide. Down the center of the rear yard there is a fence separating the boys from the girls.

While we are committed to a policy of coeducation in learning, voting, labor and professions, we still insist that the play hours shall be entirely separate, if not altogether different.

Looking down into this school's grounds during recess time and noon hours, it is interesting to observe the difference between the children on the opposite sides of the fence. The boys are having a strenuous time playing ball, darebase, tag, racing, boxing, leapfrog, snap-the-whip, and everything and anything that requires physical exercise. Everything is done with a spirit of intensity and the maximum of physical exercise.

A very different scene presents itself on the girls' side. Some of the smallest ones are emulating their brothers by playing tag, some are jumping rope, but most of them are walking about in twos, threes or fours, their arms about one another. Some are sitting in groups visiting; others are looking longingly toward the fence from which come noisy shouts and much vocal exercise. Some of the older girls show by their whole attitude that they are exceedingly self-conscious, and others try to attract the attention of the boys.

Now this community, even though prosperous, is not greatly different from all other communities in its treatment of the children's play hours. Why did not the girls run and race and enjoy themselves? They were still very young. The sophistication of the high school period was many years off for the majority of them. They were still *supposed* to be healthy animals. In their physical development sex had not as yet drawn any hard and fast lines of great difference. Had they been savages, or of the primitive nations, they would have been wearing no more clothes than their brothers—they would all have been treated exactly alike.

But with our civilization we lost some of the advantages of savagery. It is now painfully evident that our little girls become self-conscious as they enter the fourth grade. As for the pupils in the seventh and eighth grades, why, the girls would never think of romping and playing, racing and jumping at school. Absolutely shocking!

But why let the barrier that divides childhood from maturity interpose its stultifying influence while the children are still so young? The girls in that playground should have been playing any or all of the games played by their brothers. They would even find it better to fight with their fists than with their tongues. There is generally less harm that way and it is much more satisfying.

But the school authorities are not wholly to blame. The grounds on the girls' side are as well equipped as are the grounds on the boys' side. The fault lies at home. As soon as Mary or Jennie or Edythe or Ruth passes out of the primary grades she is told that romping or strenuous physical exercise is strictly taboo. Such is not done by *nice* little girls, you know! And from week to week, and month to month this admonition is given until Mary, Jennie, Edythe and Ruth will sit down to talk while the boys are exercising their muscles, with every natural impulse of the girls calling for them to join in.

We like to boast about the athletic American girl, yet comparatively few of them *are* athletic. Most of them cannot walk without tiring or suffering from sore feet; few can swim, still fewer can ride horseback, and the great majority will take no more strenuous exercise than an automobile ride. This applies to our American girls after they have been trained, lectured, and hardened in the "orthodox" mold of our modern civilization. As parents, we discourage out-of-door sports for the girls; if they are acquired in spite of us, well—we may or may *not* approve.

But back in the school grounds with the fence separating the husky boys from the robust girls is where we make more pronounced a difference that nature never intended. Later we try so very hard to prove them equal, although we have assiduously educated them along entirely different physical lines.

The boy's life is objective, muscle-making, vital; the girl's is introspective, sedentary and trivial. A few girls may defy precedent and lead a courageous tomboy youth, and a few others may go on to university and recoup to some extent their losses, physically, through tennis and basketball, but the great mass follow the line of least resistance, heeding custom's demands, and become the comfort-loving citizens of our nation.

A girl on our street has grown up, who when young was a daredevil little tomboy, much to the mortification, regret and chagrin of her parents. She was able to pitch a "curve" that was the admiration of every boy in her grade. She dared to match her speed on the paths, and there was no better runner in her neighborhood. In case of necessity she could fight as well, if not as scientifically as her boy friends.

To be sure, she was unpopular with the girls, whose mothers held her up as a "horrible example of depraved and misguided girlhood," but the boys of the community conferred upon her the thirty-third degree of loyalty and courage. She was the sole feminine member of a secret gang known to outsiders by the sinister abracadabra, "S. S. O. X." She never violated any secret and could always be depended upon.

But what a trial she was to her parents! From the minister to the keeper of the corner grocery store they all prophesied a very bad end. They did not hesitate to inform the parents that Barbara was a "problem" that ought to be "solved." Pleadings and threatenings were of no avail.

"If we could only get her to care for dolls," her mother once remarked, "we would feel

One is a boy and the other is a girl—but they don't know it! If you would put off the years where it makes any difference then let them play, really *play*.

safer about her. But she hates them. I'm so afraid that she lacks entirely the maternal instinct."

To cultivate this instinct her father brought home a large and beautiful doll for a present. When Barbara opened the box she found the doll dressed in long baby clothes. For just a moment her face clouded. Then as she caught sight of the hurt look in her father's eyes, she instantly changed her expression, and gulping twice, she threw her arms about his neck and said passionately, "It's great!"

If the parents had but understood the full significance of that little drama they would have interpreted that swift, passionate desire to shield the father from pain as the great spirit of motherhood. She never played with the doll, but she turned it over to her little brother, who was interested in its internal mechanism, with the admonition, "Now, don't pull it all to pieces, 'cause daddy gave it to me and I want it for a keepsake."

Now she is the mother of three children, and a more efficient and affectionate mother cannot be found. One of the three, a boy, said not long ago, "No matter what your trouble is, mother always gets it right away. All I have to do is to begin to tell her and she can finish it for me every time. Ain't it funny how she knows, when she's never been a boy?"

But it is because having grown up in a more normal way she understands human beings better. She had not become biased through a hothouse existence. Her life has been filled with normal, effective, physical action, and this physical action has stimulated and not dwarfed mental understanding. When her husband expresses a theory of life she does not immediately narrow it to mean certain personalities, even though such personalities may be obnoxious to her. Because of her early training she is able to follow through a course of action regardless of criticism.

"What is all this talk about the 'new freedom' of women?" she asked me the other day. "What special kind of freedom do they want, and why don't they take it? I've always been free; I never remember a time when I wasn't."

It is because women do not have freedom when they are growing and developing—physical freedom to a large extent, that will assist them to think clearly—that they realize when they have matured that there is something lacking. They cannot tell exactly what it is, so they term it "freedom."

The deprivation of this freedom begins when the boys and girls are first treated and taught differently in their play hours. To run or romp, tumble or fall is considered a disgrace for girls. Instead of independence that will make them self-reliant, they are taught and encouraged to be the passive recipients of favors. Maturity is thrust upon them before they know what it means or what it entails. Whereas our grandmothers remained "little girls" until they finished their education, the modern girl's social career begins when she enters the high school, and with some, it apparently begins while they are still in the grammar grades. Because of lack of other interests the sex impulse is prodded in a hundred different ways, and yet physically and mentally the child is unprepared for this change. Womanhood has encroached upon childhood and curtailed the days of hide-and-seek by several years. She lacks the wholesome, out-of-door objectives which the days of childhood should have developed. There is a woman in one of the large western cities whom the business men term a "live wire." She has good judgment, enthusiasm and mental alertness, and although in middle age, she radiates youth. Her early training came in the midst of privations supposed to rob life of its zest. Yet, in conversation with this woman one obtains an undeniable spiritual refreshment.

"How do you do it?" she was asked one day. "To what do you attribute your buoyancy and enthusiasm?"

"To overalls," was her startling reply, and she smiled good naturedly. "You see, I was a home missionary's daughter. We lived down near the Mexican border and we depended upon the little church back home for most of our clothes. These came in the annual missionary box. I suppose that the good ladies of the aid society did the best that they could; they sent us many things that it was more blessed to give than to receive. Always there were several pairs of clean new overalls, but never anything for a girl to wear. So mother, behind her tears, made a joke of it, and called me Bob and dressed me in overalls. I wore them until I was twelve. It may sound like boasting but I could do everything that my brother could do, and some things I could do better. I played with the boys, learning how to humor them when needed, when to discipline them, and when to fight them."

She smiled again. "The law of compensation holds just as true in childhood as in mature years, and I came to realize if I was to share in my brother's freedom, I must submit to his restrictions. The big lesson came one day when we had been playing 'robber' on the roof of our barn, and we made a rather dangerous descent from the roof by way of the branch of an overhanging tree. But the branch broke and we came to the ground pretty hard. We both ran crying to father. Me he took in his arms, soothing my fright, but to Jack he only said, '*You* can't cry, my son; you're a man!'

"The thing worked like magic. Jack looked at me and blurted out, 'Then Bob can't either if she's going to wear boy's clothes.'

"I could never forget that remark, for the logic was plain, and I have felt a severe contempt for myself when on rare occasions I have given away to tears. Overalls gave me a liberal education, and most of it I have never forgotten."

This rare woman *grew up* in the "new freedom" and today business men crave her judgment and women wonder why she has such an influence over their husbands. She understands life from a true angle—a vision acquired from a normal youthful development.

It may not be wise for all the girls of the land to wear overalls all the time, but the mothers of girls can dress them to permit a normal physical development. Simple, natural, normal development will produce among the women, as among the men, effective, efficient results. Such women are coming on the stage of action, but if we want more of them we must begin in childhood to train them.

Above, left—A study of these faces at the early school grades will prove that as far as the physical life goes there is no difference between the mentality of Mary and that of Jimmie. Then why should not their play be the same? Right—Tomboys all! In the country there is no difference. They all—boys and girls—play together.

Give the Girl the Same Freedom the Boy Enjoys!

In the oval—the lad and lassie are just as happy playing together as if they were both created the same; and why shouldn't they be? They should remain that way well through the grammar school grades.

Above—Posed? Yes! but a most natural pose. This is just the way they "sit around" at the very age that their brothers are playing "chase," hockey and baseball. An intimate knowledge of these girls and their conversation would prove to anyone that they too should be actively exercising—developing normally.

Left—Girls at this age should be romping, running, jumping and racing rather than merely playing with dolls. What is more they would prefer activity to passivity.

Right—They start right. See the girl in the middle with her "coveralls" on; she's really happy. See her attitude and expression.

The Present Status of the Jewish Question

The Jews Have Furnished Proof of Most of the Statements Made About Them. Their Defensive Action Is Practically a Confession

THE Jewish Question in the United States has existed for years, but until now in silence and suspicion. Every one knew that there was such a Question; the Jew himself knew best of all; but very few possessed the courage to open the Question to the sanitary influences of sunlight and speech. The mention of courage in this connection is needful to explain the silence. A few men of insight have attempted publicly to define the Question in the United States, and they have been so effectually dealt with by an invisible power of which the public could have no knowledge, that Free Speech on the Jewish Question naturally became unpopular. The fact, it is true, reflects far more seriously on non-Jews than on Jews. But it is a fact nevertheless. He who undertakes to speak truth on this question must expect far more opposition than he could ever withstand were he not speaking the truth.

One fact that militated against Free Speech on the Jewish Question was the condition into which our American people have been trained, of expecting applause and approval to follow every act and word. There was a time in American history, and it was the most glorious period of our past, when opposition was considered an often desirable attitude. A man's weight was accounted equal, whether computed by the number of his enemies or his friends. But a softening change has come over us. We have grown to like applause. Hisses used to stir our fathers; hisses cow their sons. Public speech has thus grown flabby; the Press has thus become neutral; we have grown pudgy and futile in our program of "helping the weak," so pudgy and futile that we no longer have gristle to attack the strong who have brought weakness upon the others.

As a people, we have passed the "bunk" around so habitually; we have enervated our judgment and moral convictions so seriously by our fake "philosophy of Boost," we have become so accustomed to measure the effectiveness of work by the applause it immediately provokes, that we have lost all stomach for courses that call for contest, unless it be those spurious contests of the political arena which are all managed from the same Great Headquarters, or those verbal assaults against "Big Business" which bring no reaction. We have lost all taste for tangible foes who have a ready retaliation.

The Truth Hurts, But It Heals

NEVERTHELESS it is true that, whereas a year ago it was not possible to speak the word "Jew" in the United States, it is now possible. The name appears on the front page of every newspaper nearly every day. It is the subject of discussion everywhere. For the time at least, speech has been liberated, although our friends of the B'nai B'rith in every state are doing their best to throttle it.

This freedom is of benefit both to Jew and non-Jew. The Jew need no longer look askance at the name of his race on the lips of a non-Jew. It only means that suppression and deceit are past, that is all; the Jew is a Jew, is recognized as a Jew, is spoken of as a Jew; and thus an honest relation between the mind and the fact is established in both the Jew and the non-Jew. The air is cleared. Concealment on the one hand is done away; on the other hand a missing fact, whose absence meant confusion, is supplied. The Jew may now say, "I am a Jew," as casually as any other man might claim his race. We may even see some noted Americans who all their lives have tried to conceal their race, come forward now and say, "We are Jews." It is freedom to the Jew; it is interpretation to the non-Jew. *Half the confusion which men meet in their efforts to account for the world is due to their ignorance of just where the Jew is.* He is always a key. But if the key be disguised as something else, how can it be used?

About eight months ago THE DEARBORN INDEPENDENT began a series of studies on the Jewish Question. It was an attempt to state the facts on which the Question is based. It was not at its beginning, nor has it since developed into, an attack on Jews as Jews. Its purpose was enlightenment, and if it secretly indulged a hope, it was this—that the leaders of American Jewry might be wise to see that this is the country and this is the time in which the causes of distress and distrust and disrepute might be removed from Jewry and a genuine *modus operandi,* not of toleration, but of reconciliation, arrived at.

The proof that these articles have contained facts and only facts is found in the failure of the Jewish spokesmen to show any one of them to be false. The record stands that way—not one disproof. The reason for the record is this: when only facts are sought, and are subjected to the tests, only facts are found. If, however, one embarks on a "campaign" whose purpose is to besmirch an opponent or create a prejudice, one's partisan zeal may induce him to accept as facts what is merely probability. These articles, however, do not constitute a campaign. They are the lighting of lamps here and there about the country, in this industry and that, in corners heretofore kept dark by those who should serve more faithfully on the watch-tower of the Press.

What THE DEARBORN INDEPENDENT has said could have had no weight at all, had not the people been able to see the same facts all about them. It is not information, but illumination, that has given these articles the importance they have found among hundreds of thousands of readers.

The Jewish response to these articles has in one way been gratifying, and in another way quite disappointing.

Jewish Activity Proves the Charges

THE Jewish response has been gratifying in that it has furnished substantial proof of all the statements made in THE DEARBORN INDEPENDENT. This journal has no doubt of the truth of its statements, and is possessed of a very substantial reserve of evidence, but none the less the corroborative evidence produced by the Jewish leaders themselves in endeavoring to meet the issue is appreciated. There is no reason to believe that this was an intentional contribution on the part of Jewish leaders; it was simply impossible for them to move without revealing further evidence.

It is quite well known what is the position of Jewish leaders today: it is one of fear. For once they themselves are possessed with the fear of the unknown. Knowing how much of truth exists behind the statements made in this series, they are in fear of what may yet come forth. They do not even make any more pretense of considering it a joke; in their own conclaves they do not rave and roar like the rabbinical editors, they behave themselves like sober frightened men, who sometimes have a desire to own up to some of the things that have been charged, but who are halted by a doubt as to how far the owning-up process would lead them if once begun. They are in fear of the truth, but mostly of the *whole truth.*

Needless to say a responsibility rests also on those who hold the whole truth. The purpose determines everything. If the purpose is to breed hatred of the Jews, that involves one course of action. If the purpose is to excite the public mind with startling facts, that involves another course of action. There is a certain danger in certain kinds of information. If the purpose is to lay a basis for an intelligent, straightforward understanding and possible solution of the question, then such information as defines the question and presents all essential material, is all that is necessary. It is within these limits that this series has endeavored to keep. If there are facts which are unfavorable to the Jews, that is a matter for the Jews. If the Jews do despite to a certain class of facts, it may be necessary to produce still another class of facts. If the leaders of the Jews had been fair, just argumentatively, oppositionally fair, they would not now be in fear of what may yet be produced.

Jewish "Mass-play" a Revelation

JEWS, for illustration, have proved the statement that they are the best organized people in the United States. They have proved that they are more closely grouped together in their own national interest than are the citizens of the United States whose whole nationality is defined by their citizenship. The government of the United States itself is not so well organized as American Jewry—and that fact is not due to anything American; it is the same in every country. Telegraphic speed and instantaneous mass action have marked every move organized Jewry has made in this country in the last six months.

It is not for nothing that they control the avenues of communication in this country. It is not for nothing that the wireless of the world is under ironclad Jewish control. They are not loosely organized in social lodges for occasional fellowship; they are organized as states of the Jewish people, with officials who do nothing whatever but attend to the advancement of Jewish power in this and other countries. They have proved by the mass play of their synagogues, their newspapers, their alleged "social" organizations, their conservative clubs and their Bolshevik-Socialist groups—all of them working together, under orders—that they are a separate people within the American people, a people that do not agree with the genius of the American people, and a people that constantly make distinctions between Jewish and American rights.

In every state, in every city, there is a Jewish organization with a definite policy, and the first policy is to suffocate, destroy, put the "fear of the Jew" upon any man, newspaper, or institution that gives the least indication of independent thought on the Jewish Question. These organizations have special committees to do certain work. One of these works is to start "a whispering drive" against the person or institution aimed at. This "whispering drive" is a most hideous oriental device; it can be sustained only by groups of minds which bear a certain racial twist.

Without giving a full description of the devices used, it can be seen that the fact of their being centrally controlled and working simultaneously in all parts of the country, creates a considerable force. No other institution now operating in the United States can accomplish that so quickly and unitedly.

Jewish solidarity would be above criticism were it used for the benefit of the whole communal life, but it is not; it is not only Jewish, but its operations show it to be largely anti-American. This does not mean anti-American in the sense of being pro-German or pro-Mexican, but in this sense, that it opposes many things that have been conceded to constitute the American tradition. The Jew assumes that the United States is still an unformed entity which is fair prey to any who can seize it and mold it. That is his attitude today. He refuses to assume that America is here; he adopts the belief that part of his duty is to bring America into being, on Jewish lines, of course.

Now, in a sense, the United States is private property. It is the property of those who share the ideals of the founders of the government. And those ideals were ideals held by a white race of Europeans. They were fundamentally Christian ideals. And with most of these the Jews not only disagree, but hold them in contempt. Indeed, a Jewish leader recently said in New York that the United States was not a Christian land, and the context of his statement showed that he clearly intended that it should never be. He was condemning the Christian Sunday, though he is an officer of a society whose purpose is the establishment of the Mosaic Sabbath.

Jewish Political Control Newly Illustrated

THE Jews have also proved the charge that they exercise disproportionate influence in governmental affairs. This charge has only been stated in this series. The mass of proof has not yet been brought to bear. But it exists, fixed beyond all change. However, another important bit of evidence has been transpiring before the country's eyes. When the immigration bill was first put up to Congress, the vote was overwhelmingly in favor of restricting entry into the country. Congress voted upon the facts and its patriotic convictions. Taking the question just as it was, no other verdict could have been given.

Hardly had the vote been taken, however, than the wires were hot and the trains crowded and Jewish protests and Jewish agents began flocking to Washington. The magic name Jew was uttered. Legislators fled to cover. Learned speeches were made. Compromises were suggested. Modifications of the original law were framed. Under the magic of Jew the whole proposal simply melted like an icicle before a fire.

The only protest made against that Congressional vote was made by Jews. Their wonderful teamwork in all parts of the country gave their protest the air of national importance. *BUT* there was one point the Jews were not able this year to deny, and that is that *the majority of the immigrants are Jews.* That fact, fortunately, was established beforehand. The hand of the Congress of the United States was stayed by the Jews in a matter of serious importance to national protection, just as a few years ago the hand of the Congress of the United States was forced to break the treaty with Russia when President Taft held it would be wrong to break it.

This proof of political power, based on nothing but sheer force and sheer determination to have what they want regardless of what the United States wants, has appeared broadcast as a matter of public knowledge.

And let the reader mark this: it will be found that this present immigration move is as much a part of the Jewish World Program as was the breaking of the treaty with Russia. Readers of the article of January 15 will recall how at the behest of the Jews, the United States' trade with Russia was thrown into the hands of German Jews who were using it to further their plans for the destruction of the Russian Empire, which later came to pass. The Jews "used" the United States to put across an essential part of that plan.

Well, what are they using the United States for now? We may well believe that the Jews are not

without several reasons for what they are doing. The Jew excels as a chess player because he plays a game wherever he may be. The immigration matter amounts to this: Jews are streaming out of Poland as speedily as they can. It is not "pogroms" that are driving them out. "Pogroms" have been proved to be immigration propaganda for consumption outside Poland.

The Jews are leaving Poland because they know something is going to happen.

And if they are leaving Poland it is a sign it is going to happen to Poland.

And if the Jews have advance news of it, it is a sign that what will occur will be inflicted by Jews.

"Anti-Semitism" Created by Jew Leaders

PLAINLY it is this: Jewish Bolshevism in Russia has made a secret decree against Poland. The Jews are getting out of the way. American Jewish agents are constantly passing into Poland. Rich American Jews are sending agents to bring back groups of "relatives." There is an *exodus* from Poland and there is a reason for it which spells trouble for Poland. The United States is being used as the chief means by which the Jews are to clear out. France protests against them and will not have them. England most decidedly refuses to have them. The Jews of the United States are powerful enough to compel this country to take them. We were utilized to effect the entrance of Bolshevism into Russia; it went from our East Side thither. We are now being utilized to assist at the destruction of Poland. It is possible, however, that by the time the Jewish program reaches that point, something may have intervened.

The Jews of the United States have also given a splendid illustration of what THE DEARBORN INDEPENDENT said of their control of American newspapers. Of course, the local newspaper editor is not dominated by any Jewish authority seated at Washington, New York or Chicago, of course not; but he is very amenable to the twenty richest Jews in his community who advertise in his paper, and it is they who take orders from Washington, New York and Chicago. So the editor gets his orders from Jewish headquarters just the same, though he may not realize it.

This, however, is one instance where publicity does not count, because it represents a business favor oftener than it does an *editorial conviction.* The knowledge of the Jewish Question which newspaper men possess is quite complete, and a confidential council of the best informed editors of the United States would include all that the government or the people would need to know for a complete handling of the Jewish Question. The publicity demanded and received by the organized Jews has proved a roorback; it has served the cause of truth more than the cause they desired, which was suppression.

Gratifying as these proofs are to the producers of the facts, there is a very decided element of disappointment in the Jewish answers. Either Jewry is feinting, or is defenseless; certainly the present status of the defense must be humiliating to those who have any conception of the importance of the matter.

The answer signed by the Jews themselves—a list of signatures which showed as in panorama the close-locked corporational solidarity of the Jewish race in this country—was devoid of a single fact which threw light. In this, the Jewish answer was almost a confession of "no defense."

But aside from its ineptitude was its utter lack of frankness. It refuses to face the question. It will not meet a single statement, either in the substance of the Protocols or in the substance of this series. It veers off whenever it approaches a concrete theme, and loses itself in a vapor of denials. If a statement is wrong it is provably wrong, especially a statement which deals with matters now actual in daily life.

The official Jewish answer, signed by a few, not all, of the Jewish leaders, is at least decent in its language, and that is more than can be said for most of the other Jewish answers. But it is indecent in its attempt to create the impression that anti-Semitism is abroad in the country.

Mark this: *All the anti-Semitism that exists in the United States today is the deliberate creation of the Jewish leaders and is a recent creation.*

The Jewish leaders want anti-Semitism here. Unable to create it among non-Jews, they are seeking the effects of it among the Jews by telling them that it exists.

The Jewish leaders of the United States have done everything possible to keep THE DEARBORN INDEPENDENT away from the Jews, to prevent their reading it and learning the fact that *NO ATTACK IS BEING MADE ON THE JEWS AS JEWS.*

From the first, after wrestling for weeks to discover a way of meeting these articles without having to confess too much, these leaders threw up their hands and took refuge in the lie of anti-Semitism.

What they ought to fear now is not the force of an anti-Semitic feeling among the non-Jews, but the force of a righteous indignation among American Jews when they discover the deceit and incompetence of their leaders.

"Anti-Semitism" has always been the last resort of scoundrelly Jewish leaders when cornered by the truth, and they have been known deliberately to incite it among the Gentile rabble in order through it to maintain their hold on their own people.

Recently there was printed in the newspapers "A Protest Against Anti-Semitism," signed by various non-Jews. The "protest" was printed twice, in fact, because it did not "go big" the first time. The newspapers were evidently growing a little weary of printing daily communiques from Jewish Great Headquarters. So, to give it more vim for a thorough circulation, the signature of Woodrow Wilson was obtained. And of course that put it on the telegraph wires again.

It was quite proper for President Wilson to sign a protest against anti-Semitism. It was quite proper for all the other signers to do so, provided that was what they meant to do.

If the protest had been sent to THE DEARBORN INDEPENDENT, its responsible officials would have signed also. THE DEARBORN INDEPENDENT *is against anti-Semitism* and protests against leading Jews using its name to foment that spirit.

The "protest," however innocent the signers may have been of this fact, *was against any public discussion of the Jewish Question,* and especially against this one.

The Wise and Oily "Gentile Front"

THE dispatches are careful to state that the Jews had nothing to do with that protest. A supposedly non-Jewish organization has been in the service of a coterie of New York Jews for a long time. The assertion that the "protest" was written by "a single citizen, a non-Jew, acting upon his own initiative and responsibility, and without consultation with anybody," is mildly amusing.

There was just enough "consultation" to make the whole "non-Jewish protest" nothing more nor less than a previously approved document, and the citizen who did the job has known for a long time where it pays to please.

As to Mr. John Spargo, whose name is beginning to appear prominently as a Gentile defender of the Jews, this much is known: he did not undertake the Jewish defense without several secret consultations with a group of New York Jews, who had to overcome several of Spargo's scruples before they could make much headway with him. Spargo's attitude was something like this: "Gentlemen, they've got it on you. It is not a matter that can be whitewashed." Spargo told a lot of truth in that New York room. The Jewish conferees knew it was truth. If Spargo should speak one-twentieth as much truth on the platform, his lecture engagements would dwindle in number.

All of the literature of the Anti-Defamation Society, all of the speech of the retained defenders, is very welcome. Open the Question up! If the Jews engage enough Gentile defenders, the time will come when Gentile logical faculties will bring about a real discussion of the Question. The Jewish spokesmen must, on pain of losing their position, limit themselves denials, abuse and threats; but the Gentile defenders are constitutionally unable to dwell in that state of mind for long; they will probe through to the truth; in which event real discussion may be expected.

Free Speech! Free Press! Jew and Non-Jew

THERE is not a single Jewish publication, however vituperative and truthless, that we would forbid the mails or exclude from a public library. There is not a single Jewish spokesman whom we would heckle or hinder on the public platform. There is not a single Jewish enterprise that we would recommend for boycott. We believe in Free Speech and unfettered conviction. By means of these the people may yet hope to clean up the United States

The Jews do *not* believe in Free Speech. They do *not* believe in a Free Press.

In every state in the Union the B'nai B'rith is introducing into the local legislatures a bill that will prevent any publication from saying anything derogatory of the Jews.

That is the Jews' *answer* to the facts produced in this publication.

In scores and hundreds of public libraries, the Jews are using the members of their race who happen to be on library boards, or are using committees of their race to influence library boards to clear the libraries of all books, pamphlets and papers that deal with the Jewish Question in a manner to leave any doubt that the Jews are paragons of virtue and The Chosen People.

This is occurring in the United States. It is occurring in some of those eastern American states that stood most valiantly for the cause of Free Speech and a Free Press in other days.

Let it go on! Multiply the instances! Add madness to madness! Each act of this nature simply gives a local proof, visible and intelligible to each community where it transpires, that what is written about the Jews is true.

The present status of the Jewish Question in the United States is this:

A beginning has been made on the too-long accumulating facts.

Jewish recognition of the truth has been expressed in soberness among the leaders.

Jewish action in response has been, for themselves, denial; for others, *SUPPRESSION.*

The result to date is:—abject failure to meet the case.

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

Jew Conquest of Mexico

Simultaneously with the inauguration of Alvaro Obregon as president of Mexico, with all the hopes to which it gives rise of a new era of tranquillity and prosperity for the sister republic, came the news that Speyer & Company, of London and New York, would underwrite the Mexican national debt. National debts are a pet invention of the Jews and for several centuries have been a blessing to them. They must have laughed in their sleeves at Pitt's oft quoted apothegm that "a national debt is a national blessing." The creation and increase of such debts have ever—and never more than at this day—been a favorite Jewish trick to enable the International Plunderbund to play ducks and drakes with all values and to provoke and wage wars. It is stated that as "consideration" for their services in paying Mexico's foreign debt, this firm of international Jewish bankers (with whom are probably associated the Cassels, the Rothschilds, the Belmonts, the Seligmans, Lazares, Goldschmidts, *et al.*) will require the deposit with them of all Mexican Irrigation bonds, which are held largely in Europe. It is significant that this step is announced as foreshadowing the early recognition of the new Mexican Government by the United States and the consequent protection of the bondholders. Already we are told that such recognition will have a string to it in the form of requiring an assurance by Mexico that Article 77 of the Mexican constitution will not be interpreted as retroactive. What this means is that the international Jewish financiers are bludgeoning our State Department into compelling the sister republic into a virtual surrender of the right of eminent domain—of the right in its judgment to levy a land value tax on oil, mineral and agricultural lands. As to these Mexican National Irrigation bonds which the Jewish Ring is getting into its hands on the pretext of a deposit to secure their underwriting of a refunding of the Mexican debt—nobody supposes for a moment that the Jews intend to pay the debt in gold—Americans who have lived in California will clearly understand that it means the most tyrannous sort of control and exploitation of the lands of the nation and of the cultivators of those lands. The men who have the power to turn on or turn off the water in irrigation canals in a country like Mexico entirely dependent on irrigation for crops, have the power of life and death over the farmers of that country. The workers are at their mercy and may be forced to pay them whatever they choose to demand. Landlordism in Ireland in the old days was petty larceny compared to the highway robbery of the water lords. It is to be hoped that while there is yet time, this nefarious plot will be so fully exposed that the people of the United States will be aroused and the government at Washington deterred from becoming the guilty accomplice of the Jewish Camarilla in this published plot to rob the people of a neighboring nation of their patrimony. Rich as are the oil and mineral lands which the foreigner (generally the Jew) has up to date been able to grab, they are but a drop in the bucket compared with the *agricultural* wealth of Mexico still to be developed, for California's history in this respect is bound ere long to be repeated in Mexico. And it is over this wealth that the Jewish octopus is now spreading his tentacles.

Five Millions in Gold

"According to the *Svensk Handelstidning,* the recent American loan of $5,000,000 to Norway was really the outcome of an agreement between the Hamburg firm of Warburg & Company and the New York bankers, Kuhn & Loeb. It is regarded as a significant sign of the times that a German firm should be responsible for an American loan to a neutral country. The conditions, subject to which this money was borrowed, are not regarded as very favorable to Norway, and no marked effect on the rate of exchange between the two countries has followed."—*The Living Age.*

The "Little Jokes" of Historical Jesters

Great Stunts of Make-Believe Which Famous Wags Have Used Successfully to Deceive the Public

P. T. BARNUM is credited with being the author of an observation to the effect that the public loves to be fooled. There are a good many who even believe Mr. Barnum made the discovery of that theory, but they are wrong. Turn back a few pages in history and you will find that Barnum didn't invent the business of fooling people. He merely made it pay.

"I will wager," the Duke of Portland boldly declared many years ago to a titled group of his fellows, "that let a man advertise the most impossible thing in the world, he will find fools enough in London to fill a playhouse and pay handsomely for the privilege of being there."

"Surely," replied the Earl of Chesterfield, the best-mannered man in the whole British Empire, "if a man should say that he would jump into a quart bottle, nobody would believe that assertion."

Thus the Great Bottle Hoax was born. The nobles bought space in the newspapers and inserted an advertisement.

"At the new theater in the Haymarket on Monday next, the 16th instant," it ran, "is to be seen a person who performs several most surprising things. He takes a common walking cane from any of the spectators and thereupon plays the music of every instrument now in use and likewise sings to surprising perfection. He presents you with a common wine bottle which any of the spectators may examine. This bottle is placed on the table in the middle of the stage and he goes into it, in the sight of all the spectators, and sings in it. During his stay in the bottle any person may handle it and see plainly that it does not exceed a common tavern bottle."

The advertisement is too long to be quoted fully here. It was said the performer would, if desired, give the name of any masked person present. For a certain sum he would, after the conclusion of the show's first part, call back a deceased husband or wife with whom the surviving mate might talk. In his private room he would, if desired, reveal the applicant's secret thoughts and past life or "give a full view of persons who have injured you, whether dead or alive."

A Joke on the Joker

THE Duke of Portland proved himself a consummate manager, for every seat in the theater was occupied. When the performer failed to appear as scheduled the house became noisy with catcalls, hoots, and yells. Some wag, however, announced that the conjurer would enter a pint bottle if the ladies and gentlemen would pay double prices; but the crowd evidently thought the quart container sufficient.

When a young man threw a lighted candle upon the stage the victims made a general charge in that direction. The mob pulled down the scenic pieces and demolished the boxes. Members of the audience lost wigs, hats, cloaks, and swords. After the theater was gutted of its contents, a bonfire in the street completed the work of destruction.

The newspapers offered various explanations of the fiasco. One asserted the program would have been given as advertised if a gentleman had not called upon the performer a few minutes before the heralded time, induced him by the payment of five pounds to crawl into a quart bottle, corked it, put it in his pocket, and thus kidnapped the fellow.

"Thus the poor man being bit himself," the journal deplored, probably in a frame-up with the Duke of Portland, "in being confined in the bottle in a gentleman's pocket, could not be in another place, for he never advertised he would go into two bottles at one and the same time.

"He is still in the gentleman's custody who uncorks him now and then to feed him; but his long confinement has so damped his spirits that instead of singing and dancing he is perpetually crying and cursing his ill fate.

"But though the town has been disappointed of seeing him go into the bottle, in a few days they will have the pleasure of seeing him come out of the bottle; of which timely notice will be given in the daily papers."

Theodore Hook, a practical joker of London, was nettled because Berners street had become extremely quiet. He finally hit upon a plan for making it the talk of the city and laid a wager with a friend, Henry Higginson, who doubted that the trick could be turned.

During three days Hook was busy. He secured the name of a Mrs. Tottingham at 54 Berners street and, after obtaining suitable stationery, wrote dozens of letters to dozens of tradesmen. To each communication he signed the lady's name and address. The next day Hook and Higginson, from an upstairs room across the street from the woman's residence, watched the fruition of their scheme.

A wagonload of coal drew up at 54 Berners street. In a few minutes a dray filled with furniture arrived. It was closely followed by a hearse with a coffin and a train of mourners' coaches. Six men brought a huge organ and a brewer's delivery vehicle then came up with barrels of ale.

That particular house on the street was a magnet and the iron filings were physicians, grocers, coachmakers, clockmakers, confectioners, wig makers, booksellers, and hosts of other tradesmen. Coachmen, footmen, cooks, house and nursery maids sought situations. The distinguished callers included the Lord Mayor of London and the Archbishop of Canterbury. Poor Mrs. Tottingham was saved by her smelling salts from an utter collapse.

The fighting, the mauling, the quarreling, the general push and jam put the fear of vengeance into the occupants of the upstairs room across the street; so they discreetly faded away while the crowd ranted and fumed at the unknown perpetrators of the joke.

But Berners street jumped right onto the first page of the newspapers and at once became a subject of wide conversation. It developed that each visitor had received an invitation to come to Mrs. Tottingham's for some designated purpose or to deliver merchandise there at the same hour that morning.

Once upon a time, as Æsop says, an unidentified joker sent out a large number of invitations headed with "The Tower of London" and artistically printed on fine deckle-edged paper. Each recipient had the keen pleasure of reading:

"Admit the Bearer and Friend to View the Annual Ceremony of Washing the White Lions on Sunday, April First. Admitted only at the White Gate. It is Particularly Requested that no Gratuities be given to the Wardens or Assistants."

Before this time nobody had ever heard of the white lions or that they needed a bath which took the form of a public ceremony. By ten o'clock of the appointed day, however, the surrounding streets were thronged and packed with titled and untitled persons who had come to see the show. An hour passed before they knew they were April Fools.

Nursery Rhyme Fools Savants

ON VARIOUS occasions archelogists and antiquarians have been swindled and imposed upon by finders of stones that bore curious inscriptions with every evidence of age and weathering. These, of course, were "plants" most skillfully contrived to deceive the savants and ridicule them.

A number of these experts were holding a convention many years ago in the town of Banbury when a queer block, said to have been the cornerstone of an ancient structure, was brought forward with the earnest request that the strange inscription be deciphered. The wise men puzzled over the matter for days and days before they ascertained that the message was merely the nursery rhyme, "Ride a Cock Horse to Banbury Cross," written backward with the words incorrectly divided; for example, the final words were "esots sorcy rub nabot es rohk co caed ir," the beginning of the ditty. Verily the scholars learned that the last shall be first and the first shall be last.

It is remarkable that a man will sometimes go to the most extreme length to uphold his side of an argument. George Hull, of Binghamton, New York, told an Ohio minister that the earth had been peopled long ago by a race of giants. The pulpit orator denied the truth of the statement and proved sharper-tongued than Hull who, however, decided to entrap his opponent sooner or later.

Accordingly the man bought a stone quarry in Iowa, but the curiosity of the neighbors defeated his purpose; so he then acquired a gypsum bed in a quiet section and began his experiment. A huge block of stone was successfully cut and shipped to a carver in Chicago. This man had orders to shape the mass into a gigantic statue ten and a half feet long.

When the sculptor had done his work the effigy was subjected to an acid bath and an elaborate process of chipping to give it the appearance of some huge fossil. Hull shipped it to Cardiff, New York, and had it buried on the farm of a kinsman. A few years later it was conveniently unearthed by well-diggers.

A sensation resulted. Certain scientists considered the figure an ancient statue; others thought it a prehistoric man or a petrified giant. It was heralded everywhere as a great find; and P. T. Barnum, the showman, had an imitation or replica made for his New York Museum.

The great Italian sculptor, Michelangelo, did a shrewd bit of deception for the entertainment of his numerous critics who incessantly asserted that the modern could not compare with the ancient Greek and Roman statuary. Now the Florentine worker believed in himself; so he chiseled a Cupid, broke the arms like the famous Venus de Milo, and buried the piece to give it the aspect of age. When it was discovered and the critics praised it as a genuine antique, Michelangelo laughed in his sleeves. He had proved his point.

Many years ago an obscure scribbler produced a poem, attached the name of William Cullen Bryant, and foisted it upon the world as the work of that genius. His project succeeded in a marvelous manner. For a long period "A Vision of Immortality" was incorrectly ascribed to the great American.

Authors Find It Easy

SOMETIMES authors deliberately fool their readers. A publisher who had hundreds of unsold copies of Drelincourt's "The Christian's Defense Against the Fear of Death" appealed to Daniel Defoe, creator of "Robinson Crusoe," for aid.

Did Defoe move the leech-like volumes? He certainly did. He penned a fictitious story (with all the accoutrements of truth) about a Mrs. Veal who had paid a visit to an acquaintance and highly recommended the work as the "best on the subject ever written." As Mrs. Veal had died a few hours before her ghostly call on her friend, the readers became interested and soon bought all of the Drelincourt books.

In August, 1835, a twelve-dollar-a-week reporter of New York City penned an astounding narrative of eleven thousand words which appeared in several installments. It purported to be a reprint from the *Journal of Science*, of Edinburgh, Scotland. The article set forth the recent discoveries regarding the moon and its inhabitants which Sir John Herschel, a noted astronomer then actually making observations from the Cape of Good Hope in Southern Africa, had ascertained by means of a new telescope that transcended all others in its power of magnifying.

The reporter, Richard Adams Locke, entered with much zest into his scheme and gave such a wealth of detail that scoffers were few indeed. Practically all the newspapers and the public received the story as a record of a new epoch in astronomical research. Scientists likewise were gulled; in justice to them, however, let it be said that Locke was an unusually gifted individual whom Edgar Allan Poe earnestly admired. He could trace his lineage back to the metaphysical John Locke, author of the celebrated essay on "The Human Understanding."

The bogus account of the moon pictured a strange, hairy animal that walked upright in the manner of a man but had the wings of a bat, a lead-colored unicorn, enormous pelicans, two-legged beavers, and an "amphibious creature of a spherical form which rolled with great velocity across the pebbly beach and was lost sight of in the current which set off from this angle of the island."

The man-bats, however, produced the greatest sensation of all the queer creatures on the moon. Three groups of them were carefully inspected by the astronomers. The animals had a yellow skin, the symmetry of the orang-outang, and attenuated feet that showed a protuberance from the heel. They flew with a marked grace of movement.

Poe, the editor of the *Southern Literary Messenger* was a much disappointed man, for a few weeks previous to the alleged discoveries on the moon he had published the first part of "Hans Pfall," the story of a Hollander who had sailed to the moon in a gigantic balloon. Though in reality a mere coincidence, Locke had apparently stolen the Virginian's thunder; but the latter, disheartened, did not finish the tale.

Nevertheless the weird, fantastic poet was determined to make use of his balloon idea in some form. Nine years after Locke's faked telescopic revelations, Poe and his family arrived in New York. He had less than five dollars in money and no job, but he put his brain to work and promptly created "Monck Mason's Marvelous Voyage" which he sold to the New York *Sun*.

The narrative contained about five thousand words. It was dressed up with a cut showing three race horses and jockeys. In ominous black the headlines read: "Astounding News by Express, via Norfolk. The Atlantic Crossed in Three Days. Signal Triumph of Mr. Monck Mason's Flying Machine. Arrival at Sullivan's Island, near Charleston, of Mr. Mason, Mr. Robert Holland, Mr. Henson, Mr. Harrison Ainsworth, and Four Others in the Steering Balloon, Victoria, After a Passage of Seventy-Five Hours From Land to Land. Full Particulars of the Voyage."

The account was plausible, as Mason and Holland were balloonists and the others had attained prominence in their respective ambitions. According to the narrative, the men had started from Wales with the intention of crossing the English Channel. A break in the mechanism, however, had made the thirteen-foot gas bag unmanageable and a strong wind had propelled it at sixty miles an hour to the American coast where a safe landing was effected. Mason and Ainsworth had kept a joint diary which formed the body of the news story.

This hoax lived only a short time, though Locke's had lasted many weeks. The rival editors probably remembered the previous experience and were wary. The publishers made no serious effort to prolong the deception, for two days later they admitted failure to receive confirmation.

Riley's Literary Joke

IN THE budding days of his career James Whitcomb Riley, the poet, thought he deserved from magazine editors more attention than he received. He declared that his true name had a fatal lack, the lack of the "poetic ring." One day he confided to J. Oscar Henderson, manager of a Kokomo, Indiana, newspaper, that "J. W. Riley" could write verse equal to that of the great Edgar Allan Poe. Henderson agreed.

Riley was running a newspaper in the neighboring town of Anderson. The two journalists frequently saw each other; so they put their heads together and evolved a plan. The poet wrote in Poe style a production which he labeled "Leonainie." An expert penman, supplied with a sample of Poe's handwriting, transcribed Riley's verse on the flyleaf of an old dictionary and signed the initials, "E. A. P."

The two conspirators found another, a butcher, who was to tell how he had discovered the book while he was waiting at the home of a friend. The story bore a close resemblance to Irving's account of Knickerbocker. The book had belonged to the friend's grandfather who lived near Richmond, Virginia, where he kept a hotel. A dissipated young man had occupied a room one night, vanished without paying his bill, but had left the poem inscribed on the flyleaf of the dictionary.

When Henderson published "Leonainie" and the story of its finding, American and English critics accepted it as a genuine composition by the departed genius. When the truth finally came out, Riley was severely censured as an impostor, and so he was; but many persons stoutly maintained Poe's authorship and called the Hoosier poet an interloper.

"I wrote it but I did not," the father of the faked verse said, "and I am a liar any way you put it."

Under the Dome of the Congressional Library

By AARON HARDY ULM

A COUPLE wandering through the Congressional Library, the one building that no first visitor to Washington ever misses, stepped unintentionally through a doorway that is usually closed to sightseers.

"Why, mother, they do have books here! Look at 'em," exclaimed the man of the party to his companion, as he gazed wonder-eyed at stack upon stack of volumes covering acres of space.

"Well, I never heard of books being in this pretty place," the woman remarked, as a library attendant arrived to tell them that the book realms were not open to casual visitors.

"Frequently it happens that visitors ask us to direct them to the main library where the books are kept," remarked the library attaché who told the above story to the writer.

The majority of people who visit the United States Congressional Library rarely think of the establishment in connection with what it was set up to collect and preserve, namely, books and kindred material. The building is so elegant, the fittings so rich and unusual, the exhibits filling the hallways so fascinating, that the great national library has taken on a significance that is largely separate from literature and its customary accompaniments. In the popular mind, it is more a show place than the greatest storehouse of the printed word to be found on this hemisphere. In fact, its documentary contents excel those of all but two other establishments in the world. The two are the national libraries of France and Great Britain, respectively. And our national library, though much younger, closely approaches them in variety as well as volume of contents.

What is also generally unrecognized by those who know books are there is that the United States Congressional Library is more than a storehouse of written or printed knowledge. It is more than even a facility for the use of Congress and the governmental departments. In the realm of general bookdom it is much more than a haven for students and bookworms. To some but not a full extent it is the "mother" of all the libraries in the country. And it is a place to which thousands of knowing people go or make appeal for help along lines that have only an indirect relation to literature, despite the fact that most people think of the place only in terms of the magnificent dome, the marble hallways and stairways and the fine decorations which make it the preeminent example of American achitectural achievement.

Recently, for example, a man out in the Middle West thought of going into the hair goods industry. But when he looked around for data on that industry, he could find no source of information. It then occurred to him that the Congressional Library might put him on the track of such data. He was right; the reply sent to his inquiry contained more than 40 titles of books, pamphlets and articles, relating to the hair goods industry, on file in the library. They covered virtually every angle of that business, from collecting the queues of Chinamen to the fabrication of hair for wigs.

From the list furnished him he could easily find how much of the information he needed could be located in his own local library and how much might be purchased from bookstores or publishers. If it turned out, for example, that an essential document could not be procured elsewhere than from the Congressional Library, all he had to do was to take up the matter with his local library and in all likelihood be able thus to have it sent to him.

The inquiries regarding book data that come through the mails to the librarians of the Washington institution number about 3,000 a year. They have doubled in number during the last decade but if everybody appreciated the possibilities for practical use afforded them by the Congressional Library, the inquiries would probably number several hundred thousand a year. To make practical use of the great national library, it is not necessary to go to Washington or even write to a member of Congress to obtain the information desired. Though for reasons hereafter to be sketched the library doesn't widely advertise the fact, a force is maintained especially to make the resources of the library available to whoever may need them.

Only a small proportion of the inquiries coming to the library are of the character of that having to do with the hair-making industry. Most of the inquiries bear on matters of literary interest or dispute. Perhaps the largest group has to do with quotations. At least once a month, for instance, somebody writes in to inquire who originated the saying about the beaten road that will be made to the doorway of the person who makes a better mousetrap or preaches a better sermon than his neighbor. The library authorities haven't been able to make positive decision but they hold that the evidence indicates that Emerson probably said it in a lecture. They have found that the quotation was first written out and accredited to Emerson by a Mrs. Yule, of Oakland, California, for a book of "Borrowings" gotten up by the ladies of the First Unitarian Church of that city. That occurred in 1891, which would appear to exclude the claim of some people that Elbert Hubbard originated the quotation.

Another inquiry coming constantly to the Congressional Library relates to an oath that a well-known secret order is often accused of requiring of its members. While the librarians cannot say, of course, that the charge is untrue, they present the known evidence which gives no creditable validity to the charge.

Those two inquiries and several others of like kind come so frequently that the replies have been reduced to "form" and are kept in quantities of multigraphed or typed sheets.

More important inquiries are treated similarly, and from that group you can trace the changing lines of national thought on big public questions.

Several times a month somebody writes in for guidance to the literature on the Japanese question; hence a long bibliography, giving the sources of virtually all printed information on the subject, goes forth in reply to each inquiry.

When the war accentuated the shipping question, hundreds of people wanted to read up on shipping, especially ship building. The library force prepared a printed booklet that gives more than 2,000 classifications bearing on that subject, and hundreds of the booklets have been circulated.

"A wholly false notion is entertained by most persons regarding libraries and librarians," said an attaché of the Washington institution to the writer. "They view libraries as places maintained for school children and for the circulation of novels and other forms of so-called fine literature, and think of librarians as being bookworms who sit and read all day. Libraries, of course, keep supplies of books for children and novels for leisurely women and others. But neither nor both is the prime excuse for existing. They are set up for service to all the community, the business man or manufacturer equally with the reader for pleasure or the student. And capable librarians have to be skilled managers and organizers. They know books for such is the raw material they deal with but the kind of books you think of in connection with libraries are not the ones that cause them the most worry. The latest novels will take care of themselves but a librarian must watch and search and catalog continuously if he makes sure of rendering good service to the man who wants to know the literature of pumps."

"The 'literature of pumps'?" I asked. "Is there such a thing?"

"Call them something else if you wish, but the books now in most demand from libraries are not what you would class as 'literature.' They are not written by literary people and rarely are what you would term well written, though among them are some books of genuine literary value. They are books that tell about things and how to do things and are read for practical instead of esthetic benefit.

"Barring novels, which are the inevitable exception that proves the rule, technological books, the kind that deals with pumps and electricity and plumbing and machinery, constitute the literature now most in demand from big libraries. After those come books on economics."

So numerous were the demands on the Congressional Library recently for information on co-operative buying and selling that the librarians were impelled to get up a volume indicating the extent and availability of written matter on that subject.

There recently was an inquiry for guidance on the literature of artificial silk, on which the librarians were able to specify 48 titles of books, pamphlets and articles. Another for something on soap drew forth 46 book and 40 article classifications.

On the day that the writer visited him the library's bibliographer attended to similar inquiries for information regarding the rusting of re-enforcing steel due to sea water and the testing of preservative coatings for steel. He was able to refer to 16 documents dealing with the first of those highly technical subjects and to 23 having to do with the second of them.

The Congressional Library contains more than 3,000,000 volumes of books, pamphlets and like articles. Two copies of everything copyrighted in this country must go there. In addition, a great many books are purchased and others are procured through exchange. Virtually everything in the way of official reports for foreign countries as well as our own are filed there. They were of great help during the war.

There was a town in France, for instance, where the general staff of the Army wanted to build warehouses and set up establishments using machinery and therefore would need power. All that they could find from information available to them was that the town had the right geographical location. To have made a survey of the location on the spot would have taken two or three months. The general staff sent an investigator to the Congressional Library where he was put in touch with documents that enabled him to make a minute report on everything having to do with the obscure French village. And from the report plans were made for setting up warehouses on ground 3,000 miles from those who did the planning.

The big industrial enterprises, like the United States Steel Corporation and the Standard Oil companies, employ librarians and bibliographers as they do chemists and engineers. Several have libraries that for the subjects covered excel even the Congressional Library. Yet they often have men spend months in the great national establishment cataloging all of interest to them there and often in making searches for information that may mean much in the way of trade extention or changes in processes.

While the Congressional Library contains the greatest reservoir of book matter to be found this side of Paris or London, its possessions are not confined to what is printed from type.

There is to be found the greatest collection of unprinted manuscripts that exists on this continent. In the main they are of historical value only. The Presidents of the United States now make it a rule upon leaving office to deposit their papers with the library, which selects and catalogues those of historic worth and returns others that are of merely private interest.

Theodore Roosevelt's great store of correspondence covering virtually his entire career is on deposit there. President Taft's papers filled nearly a dozen trunks when delivered to the library. John Hay's papers and those of hundreds of other public men of the past are there.

The papers of individuals are not always accessible to the public. In many cases they are deposited under the condition that they will not be made public until a certain date or until the surviving members of the subject's family give consent. This is to prevent the embarrassment that would be caused many persons by the untimely publishing of some things, like private letters. The library also possesses numerous collections of papers left by famous men of the past like Washington, Jefferson and Madison. It has purchased many collections of historic worth.

In addition to manuscripts it also collects pictures and photographs. Its store of prints is the largest in this country, and, excepting when controlled by copyright they are available to anyone who wishes to have copies made of what they want.

There is also a maps division that looks after an immense collection of documents having to do with geography. It is of great avail to individuals or concerns needing detail data on little known or remote corners of the earth.

It was in that division of the Congressional Library that there was found the document laying at the basis of the settlement of the historic Venezuelan boundary dispute between this country and Great Britain. An ancient map that happened to be there cleared up the main points of the controversy that for a time seriously threatened to cause a war.

The Congressional Library receives more than 15,000 newspapers and periodical publications, most of which are available to readers who visit the reading rooms. It preserves files of more than 300 American newspapers and those of the leading magazines. It has newspaper files that are several centuries old.

Though the racks holding the books now in the library would cover, if spread out, five or six acres of ground, the establishment seventy-five years ago didn't have many more books than can be found in the average small town library.

There were only 3,000 volumes in the Congressional Library when it was destroyed by the British in 1814. Shortly after the British retired from Washington,

(Concluded on page 12)

THE LIBRARY OF CONGRESS

The Latter-Day Lloyd George

Concluded from page 3

Thus we find him rapidly attracting nation-wide attention as an antagonist of special privilege. His career in the House of Commons was spectacular for England was eager for someone to destroy the assurance of the British upper classes.

In Parliament Lloyd George, at twenty-seven, became known as a man whom Gladstone could not ignore. When Chamberlain became prime minister Lloyd George forced this calm speaker to wince, leap to his feet and ask permission for a second speech in reply. That was the first occasion which caused members to say among themselves that Chamberlain, gladiator that he was, had met his match in Lloyd George. Then followed a career of daredevil statesmanship, devoted to the correction of long-standing abuses in class legislation. When the Boer War broke out he was outraged at the thought that a great people like the British nation should attempt to crush a tiny race even under provocation. As the fiery pacifist of this war, Lloyd George journeyed to Birmingham, where his attempt to make a speech was a signal for a riot. The furnishings of the hall were destroyed, one man killed, several injured, and Lloyd George was smuggled out of the hall in a policeman's uniform. This is an especially significant story to bear in mind when contrasting the early Lloyd George with the present prime minister.

(C) U. & U.

The present-day Lloyd George

Then along came the culminating fight in the career of the early Lloyd George for a new social order in which privilege would defer to majorities. He was given the post of chancellor of the exchequer by Mr. Asquith, who was then prime minister. Immediately he planned a new system of taxation of the rich which would provide insurance of workingmen against illness and unemployment, and the payment of old age pensions. This was to be done by an income tax.

When the House of Lords killed the budget Lloyd George broke the power of Lords. He called for a general election, which returned the Liberal Government to the House of Commons with a majority of one hundred and twenty-four. On April 28, 1910, his budget was passed from the House of Commons to Lords, who, in turn, ratified it without further comment. The creation of five hundred new peers was the threat that forced the House of Lords on August 9, 1911, to agree to more restrictions of their powers.

Then came the war. The pro-Boer dropped the pacifist tendencies and flung himself into the struggle. One of his first moves as finance minister was to summon his former enemies, the leaders of the commercial and financial world, to 10 Downing Street. By a bold stroke he, the arch-fiend of yesterday, won their confidence and a glimmer of praise from the Northcliffe press. Soon he became minister of munitions. Then adroitly, in a preface to a book, he made a direct attack on the cabinet, of which he was a member. Conscription came and the downfall of his chief, Mr. Asquith, with the subsequent elevation of himself as prime minister.

Only has one to look at his cabinet, and his associates, to see how rapidly he has traveled through the Liberal camp to an ultra-conservative position. His minister of foreign affairs is Lord Curzon, the loftiest peer in all England, with an inordinate contempt for the rights of subject peoples. His minister of war is Winston Churchill, who is a militarist to his fingertips, and is responsible, with Lloyd George's approval, for the cabinet's military campaign for imperialistic purposes in India and Mesopotamia.

Bonar Law, another conspicuous member of his cabinet, has been a consistent anti-Labor man while Arthur Balfour, Lloyd George's old enemy in the budget fight, functions as the prime minister's most trusted advisor and emissary to the League of Nations. Moreover, Lloyd George now finds the companionship of the conspicuously wealthy Sir Philip Sassoon and Lord Riddell, who has amassed an immense newspaper fortune by the publishing of the *News of the World,* which is a sensational sheet devoted almost exclusively to divorce court scandal, more congenial than the former devotion of the common people of his origin.

In his present-day policies he seems to have lost all his sympathies for the common man. Once an ardent opponent of the Boer War, because of his sympathy for weaker nations, he now orders an immense army into Mesopotamia and India. Formerly a great stickler for parliamentary rights, his cabinet displays an open contempt for the ordinary questions raised in the House of Commons and he shows an impatience when questioned too closely by Parliament on matters of governmental administration. A former critic of imperialism, he devotes most of his energies at the various peace conferences and meetings of the supreme council to the advancement of Great Britain's imperial interests. When he deals with Labor it is no longer in a conciliatory mood, but entirely with the air of the gentry against whom he fought his legal battles as a young solicitor.

Lloyd George is charged with having neglected the interests of the dominions and colonies in the empire. There is an increasing conviction that the British Empire can be held together only by the reconstruction of the machinery of representation which would result in an association of the dominions in a mutually helping empire, instead of the old procedure in which London dictates the trade and political policies of far-away dominions. Here is the great problem confronting England today, yet Lloyd George, in the opinion of his countrymen, has tried to sustain the old, self-assurant air of the country with suppliant dominions and helpless colonies. Yet time and again one hears in England that the English are tired of "bearing the white man's burden" and they are yearning for the time when England will lay down her troublesome burdens as an imperialistic power.

England sighs for a new prophet. They feel that the latter-day Lloyd George has assumed the rôle of an imperialist which ill suits him. The middle class feel that he has deserted them. The upper classes, with whom he has now cast his fortunes, can never forget their old hatred of the man who dealt a death-blow to the House of Lords.

The increasing restlessness of the English people with the old order is rapidly focusing in an opposition to the one man who gained their confidence as a prophet of the new, and then squandered his power in a wild effort to sustain old injustices.

Under the Dome of the Congressional Library

Concluded from page 11

Congress purchased Thomas Jefferson's library, which was the nucleus around which the big institution that now exists was built. The books procured from Jefferson numbered 7,000 and in 1851 the total in the library numbered only 55,000 volumes. Another fire reduced the number to 20,000. The Congressional Library as it exists now really began to develop in the sixties with the purchase by Congress of the Peter Force collection of 60,000 books and documents that related exclusively to America. But no one heard much of the institution until the present magnificent building was erected about 20 years ago, and since then everybody knows of the structure but comparatively few are familiar with its contents.

The Congressional Library is not a free circulating establishment like the regular public library. Only members of Congress and high officials in Washington can take out books *ad libitum,* but anyone by going to the reading rooms may make use of any of the available material there. Scores of students and writers and investigators are always there. More than 1,000 readers can be taken care of at one time.

But, in emergency or by stress of necessity, books can be procured by anyone from the Congressional Library. They can be had in two ways, by appealing to members of Congress or to local libraries. In lending books or documents to unofficial outsiders the library never deals with individuals, who, however, can write and obtain information about books. The library frequently lends books or documents to public libraries for the use of patrons and sometimes the assistants spend days running down some bit of obscure information for someone far from Washington.

The Congressional Library serves as a sort of feeder for lesser libraries which in numerous cases use the classification system adopted in Washington and in the case of several of the big public libraries in the cities, carry a file of the Congressional Library catalog cards.

"What people should learn is that the contents of a library represent concentrated brains," said one of the officials. "A library isn't a mere place for bookworms or readers of light literature. It is an institution that can and does render service in any and every branch and function of life and activity. A library is just as much a business as a literary institution."

But Congress takes the view usually, that even the Congressional Library is a mere depository of literary lore; and that, aside from the building being a show place for visitors to Washington, it can render little service of a practicable nature. For Congress follows a rather niggardly policy with regard to the working force in the library. It is claimed that, though a high school graduate may qualify for a $1,320 clerkship in the government departments, a junior librarian, who must be a university graduate with two years' postgraduate work in a library school, is paid only $1,200. And the entire force that has to do with making the contents of the 3,000,000 volumes in the library available on need to persons not in nor able to go to Washington costs the government less than $15,000 a year. The chief of the force, a noted bibliographer with almost a lifetime's record of service with the government, is paid only $3,000. And the foregoing is why the librarians are not eager about the general availability of the Congressional Library being widely advertised.

The Wood Hollow Papers

By ROBERT PAGE LINCOLN

BIRDS may unconsciously do harm in the vineyards, apple orchards and berry patches but these do not belong in the natural scheme of things; they are artificial growths reared by man. The berries and fruit in general that grow in the world of nature are for the birds to select from and feast upon as they will. Hence the question always arises: should men kill birds regardless of their value as insect destroyers because they steal a few berries? Berry growers kill a number of birds found vandalizing their fields. The ruddy sides of apples will also be scarred and pecked into by the birds, thus spoiling them for sale in the market. This is exasperating and merits condemnation but the hand is stayed by the inevitable thought that arises in most minds: that, in spite of the small harm done the actual value of these birds should not be cheaply or scornfully reckoned. Raspberries, blackberries and currants in season are relished by many birds, and often as not the robin is as crimson around his beak with berry stains as any lad who ever inserted his face in a jam-jar. The robin is a ground-feeding bird; and I doubt if there is a more active destroyer of the cutworm than the robin, though of course here we have to consider the toad which holds first place, cutworms being with the toad foremost on his bill of fare. I am of the belief that save for the toads and the robins the cutworm would be a veritable scourge and would clip down every garden plant close to the ground. Through countless centuries of adapting itself to its surroundings it has come to be that the cutworm issues forth only at night; so nature, all-wise nature, counteracts by sending forth the toad at night to keep down the surplus and so preserve the unalterable law of balance and proportion. But likewise has she set the robin to run along the earth and help by day while the toad is at rest. See the robin turning leaves, lumps of wood and grass and dragging them out; but the berry grower pays no attention to whether the robin is working on the ground or on the bush!

The brown creeper, *Certhia familaris americana,* is always with us in the land of snow, but by reason of its retiring disposition and its ability to keep out of sight one sees very few of them. Nevertheless there are numbers of them busy in every wood in our northern region; and two or three of them at one time have been around my seed boxes though I have never noticed that they have taken a seed. They come merely to pay a visit. Seeing so many birds tending this way they like to "follow the crowd." They loiter around, clinging to the tree bark and take all the time in the world to explore every inch of the wood they cover. The brown creeper generally starts at the bottom of a tree and works upward; almost inevitably he starts at the bottom. He is never really flighty or nervous. I have passed one just starting in at the roots and two hours later have noted with surprise the same fellow at it, though by this time well up on the tree. He is exceedingly painstaking. He hates to leave a tree until he is sure that there are no crevices left uninvestigated. He works up the tree in a spiral fashion, the upward, round-about fashion of a corkscrew. His bill is slender and curved. The reason for this is that it can be worked into the side galleries that the straight-billed birds cannot reach. When he does probe in a hole he feels around inside and you can rest doubly assured that if there is a living thing therein he will nip it. Is it not wonderful? First come the straight-billed birds to glean the outer surface. Next come the especially equipped birds to work into the galleries!

The brown creeper is a forsaken, apart fellow; does not indulge in any notable melodies—a persistent, never-ceasing plugger, one of the greatest friends of man. In coloration he is clouded-white underneath, with a back that is brownish, striped with gray. The tail and wings are reddish brown, the wings partially relieved with gray. It is remarkable how this coloration merges in with the hue of the wood it works upon. Standing at a likely distance you can positively swear there is a feathered creature working on the tree upon which you are directing your eyesight but for the life of you, you cannot make out the bird. You approach slowly, keeping your eyes riveted on the trunk. At a distance of twenty feet you make out the creeper—*and you are amazed by the fact that it looks like a piece of bark!*

The brown creeper has a sharpish tail which acts as a brace when it is on a rather disagreeable angle on the tree. It is like the triangle bracket we put up against houses when laying down scaffolding. The slanting section of the bracket acts much the same as the bird's tail set in against the tree.

The bill of one of the winter birds of the North is an oddity, to say the very least. I am referring to the crossbill, a bird that keeps itself almost wholly to the pines; in fact, it feeds largely upon pine seeds. To aid it in its task of wrenching out these seeds from the cone, nature has crossed its bills, much as you would cross your forefinger with your long finger. This appears to be a vast help to the bird, an evolutionary process, an adaptation.

(Continued next week)

Near East Continues to Hold the Spotlight

By W. P. CROZIER

THE death of King Alexander, of Greece, had the effect of an earth-tremor in the politics of the Near East. It would hardly be possible to find a question which better mirrors the condition of Europe (and part of Asia) at the present moment. It illustrates the rival policies and interests of England, France and Italy in the Eastern Mediterranean, Southern Europe and the Middle East; it brings again on the carpet the fate of Turkey and its position as a great or small power; it revives the contending jealousies and ambitions of the Balkan States; it awakens in some minds the old fears of German influence in the Near East; it raises dynastic and constitutional issues which concern more than Greece.

When in 1917 Constantine was driven from Greece, it was expected that Venizelos would have made an end of monarchy, if only because his experience had shown him how easy it is to turn a monarchy which in theory is constitutional into a despotism. But Venizelos preserved the dynasty. It is quite true that he has expressed his belief in monarchy as the best form of government for the Greeks—probably because the Greek political leaders would never tolerate the elevation of one of their own number to the position of chief of state—but he stated explicitly at the time that the protecting powers—that is to say, England and France—insisted on his maintaining the dynasty. (There were, of course, close connections between the royal families of Greece, Russia and England through the royal house of Denmark.) The dynasty being thus maintained, the exiled Constantine became (like James II of England and every other exiled monarch) the object of the devotion, intrigue and unceasing activity of the royalist and anti-Venizelist parties in Greece. Had the powers in 1917 not insisted on the retention of Constantine's house at Athens, the issue between monarchy and republic might well have been settled once and for all and the Near East not have been thrown into the melting pot as it now is.

The first question is whether a Greece ruled by Constantine and his wife ought to be allowed to retain the great accessions of territory given to her under the treaty with Turkey signed at Sèvres. They were given to her partly because the populations were largely Greek, partly because they had to be taken away from the Turk and the Greeks claimed them, partly to reward the pro-Ally Greece and the pro-Ally Venizelos for the help which they had given in the war. Undoubtedly it weighed heavily with the supreme council that the representative of Greece was M. Venizelos, who could be relied on to support the Allies (and especially England) in the future as in the past. This pleasant plan is now broken to pieces.

The parts of Turkey ceded to Greece include Thrace, just north of Constantinople, all the northern shore of the Dardanelles, and the province of Smyrna. The Greeks therefore command the approach to Constantinople from the north and the sea and threaten it from the south. They command the straits leading to the Black Sea and so have a stranglehold, if need be, on Rumania, Bulgaria and Russia. A satisfactory arrangement, possibly, as long as this great power is in the hands of a liberal-minded government which is in general sympathy with the countries which won the war. But not so satisfactory if Greece is governed by a king, queen and advisers who desired Germany to win, who did what they could to prevent the Allies from winning and who, worst of all, profoundly admired and believed in Prussian principles, both political and military, and probably still do so.

It is this belief in Prussianism as a principle which really makes Constantine obnoxious much more than the fact that he or his consort called the Allies "infamous swine" in a telegram to the kaiser. In any dispute which might in the future arise, would not the influence of Constantine be cast, so far as lay in his power, in favor of what in a rather vague way we call "reactionary" foreign policy? Prussianism has everywhere been broken in its homes; only at Athens it raises its head again. There are those who say that Constantine must have learned his lesson, that the downfall of Germany has drawn his sting forever, that he realizes finally his dependence on the great sea-powers. Certainly it ought to be so and there is no doubt that he and his ministers (Gounaris, Rhallis and the rest) are overflowing with anxiety to persuade the world that they will faithfully fulfill M. Venizelos's foreign policy, that Greece may preserve the rewards which he gathered in for her. But that is elementary prudence on their part. Even if one puts the best face on the future, it is highly disagreeable to contemplate Constantine and his henchmen being left in charge of the gates to Constantinople and the Black Sea.

England, France and Italy regard this problem from very different angles. Italy was opposed to M. Venizelos and his idea of a Greater Greece. As she fears the rise of a powerful Jugo-Slavia, so also she fears the expansion in the Eastern Mediterranean of Greece, with her bases in the home country, in Macedonia, in Asia and in the islands. Even in 1917 she would not support France and England in their policy toward Constantine, knowing that his ejection meant that Greece would enter the war on the side of the Allies and that M. Venizelos would claim the appropriate reward. Italy therefore makes no secret of her pleasure that M. Venizelos is overthrown, believing (with good reason) that a Greece which is "run" by the Constantinist politicians will be less enterprising, less formidable, and much less likely to put the Western European powers under obligations than the Greece that was Venizelist. If, therefore, it should be seriously proposed to take away from Greece any of the territories that were given to her under the Turkish treaty, as France would like to do, Italy is not likely to oppose. Whether she would prefer in that case to restore these territories to Turkey (for whom in general she certainly has no affection) or to hand them over to some international administration, would depend on how far she feared to strengthen Turkey, how far she desired to perpetuate Turkey as a force in international politics, and how far she hoped that this territory, if now internationally administered (for instance, Smyrna) might eventually fall into her own lap.

The French position is simpler and more ruthless. The French papers say that there must be no compromise with Constantine because French troops were shot in Athens under his orders in 1917. It is a good reason so far as it goes and certainly the French have no reason to love Tino, but they would probably be able to overlook this injury, were it not that the Greek crisis enables them, as they think, to strike a sound blow for French policy as a whole. Greece is only a pawn in the great game. France would like to tear up the Treaty of Sèvres, to take away from Greece some of her new territories and give them back quite unreservedly to Turkey.

The difference between Italy and France is that while Italy wants only to weaken the new Greece, French policy aims at perpetuating and strengthening Turkey. At present, for all practical purposes, "Turkey" means the Nationalist forces of Mustapha Kemal, whose headquarters is at Angora. Kemal and his army are now overrunning the republic of Armenia and they are in close alliance with the Bolshevists, who will certainly use them, if it is possible, to harass and weaken the French in Cilicia and Syria and the British in the Middle East. The French desire to make peace with Kemal, to detach him from the Bolshevists and even to use him, if they can manage it, against the Soviet Government. They think, for instance, that Kemal might be induced to march through the Armenian republic of Erivan to the shores of the Caspian Sea and to seize Baku and its oil fields, which would be a heavy blow to the Bolshevists. But Kemal will do nothing for nothing. If he is to be brought to make peace and possibly to become an ally against Soviet Russia, he will have to be bribed and the Greek crisis has unexpectedly presented France with the means of bribing him. Let us, says the French Foreign Office, offer to restore Smyrna and perhaps Thrace also to Kemal and so re-establish Turkey as a counter which France may use in the game of diplomacy against a Russia which now seems likely to remain permanently Socialist (not necessarily Bolshevist) and pacifist. In this scheme Turkey will remain a profitable "sphere of influence" for French finance and commerce—French finance has always been extremely active in Turkey—and she will not forget that she owes her survival and her escape from the crippling clauses of the Sèvres Treaty to the friendship of France. Greece will lose heavily, but after all, say the French, does anyone really believe that Greece has the resources necessary to maintain an Asiatic as well as a European empire?

England does not wholly share the views either of Italy or of France. Certainly she would not have given the new territories to a Constantinist Greece, for she distrusts Constantine profoundly, and it might be best in her opinion to withdraw some of them even now if they could be handed over to an international administration under the League of Nations. But she is deeply averse to seeing any territory that was formerly Turkish handed back to the Turks. Where the Turk rules, there is waste and misery and neglect. Already, after a short year or two, Palestine is lifting up its head and the same will quickly be true of Mesopotamia, if the mandate be administered fairly and honestly with equal opportunity for every nation. It would be a crime, England holds, to restore Smyrna or Thrace to the Turks simply for the sake of the old and discredited game of diplomacy. The new Greek Government obviously hopes that the "guaranties" of loyalty and good will which it intends to offer the three powers will persuade them to leave to Greece the Turkish territories undisturbed. There is a section of the British Foreign Office which is in favor of doing this but at the same time of telling Greece that for the future she must herself bear the burdens of her new empire; this, being a poor country, she will find it extremely difficult to do. It is suggested from the British side that a "compromise" might be effected by accepting Constantine's eldest son, George, as the new king, in which event Greece might keep her territories, although without Allied support. It is a poor compromise, indeed, for under it Constantine would still be the real king of Greece. If, however, France and Italy insist that Greece should be deprived of territory, then the British view is that it should be handed over to any administration except that of the Turks.

The Jambie Tree—By FRANK DORRANCE HOPLEY

The specter or Jambie tree, Trinidad. The photo at the left shows the nails driven into it by those desiring vengeance.

LIKE a watchman, on the alert to discover the approach of an enemy, but a short distance from the famous asphalt lake, on the Island of Trinidad, British West Indies, a lone tree lifts its head skyward. Tall and stark and bare, the trunk rises for more than twenty-five feet without a branch. At the top of the tree there is a sudden mass of twisted branches and sparse foliage, which silhouetted against the sky resembles the gnarled and scrawny fingers of some gaunt and giant specter. Superstition runs rife among the natives of Trinidad. To the blacks, the specter tree is a tree of vengeance, in which dwells the terrible Jambie bird. To see this bird means certain death.

When one of the natives desires revenge upon another, he goes to the Jambie tree. There he prostrates himself upon the ground, making many obeisances, and muttering strange words. Then he rises and drives a nail deep into the trunk of the tree. As the nail enters the tree the Jambie gives a promise that its wrath shall be vented upon the hated enemy. Hundreds of nails are imbedded in the trunk of this tree.

When the ground was being cleared, some years ago, it was deemed necessary to cut down the Jambie tree. This, however, the native workmen angrily refused to do. The ultimatum was given by the blacks that if any one touched the Jambie tree, he would be immediately killed. The tree, in reality, is a specimen of the silk-cotton tree, which is found not infrequently in the tropics.

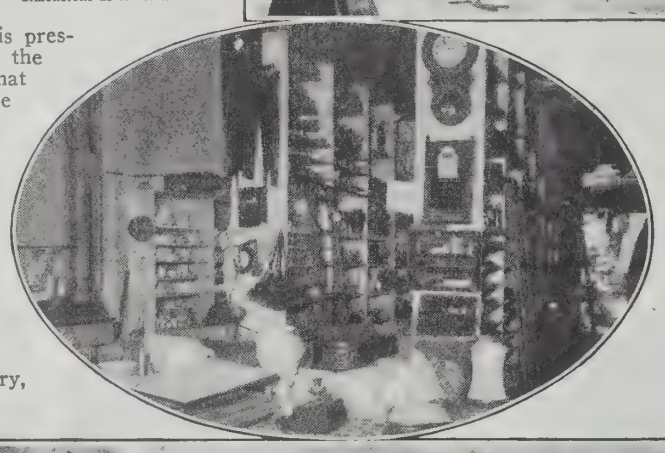
The Day of the Super-Property Man Has Come

Vast Storerooms in Motion-Picture Land House Thousands of Dollars' Worth of Valuables

By JOHN B. WALLACE

EVERYTHING is super these days. We have supermen bossing the world and superwomen trying to vamp them out of their jobs. We have supermen of science and art and supermen in the prize ring. Also a superabundance of food products at supernatural prices and vended by supercilious middlemen; not to speak of superstition as exemplified by the ouija board. Therefore why not a super-property man?

Certainly in comparison with the property man of the speaking stage, a motion picture property man can most properly be called a super-property man. Accordingly I feel that my action is justified when I dub Howard S. Wells, manager of the property department of the largest film studios in California a super-property man.



Those who are accustomed to the property men of the dramatic and musical stage would never connect Mr. Wells with such a line of work. Props, the overalled handy man, at once the servant, friend and critic of the Thespians who tread the boards within his domain, is as much unlike the manager of a motion picture studio property department as the proprietor of a corner grocery is unlike the manager of Wanamaker's. It is the difference between big business and little business.

Wells is tall and spare in build, pleasant and courteous in manner but with the "Please be brief, I am a busy man" aura radiating from him so strongly as to permeate the consciousness of the most rhinocerous-hided bore.

Mr. Wells, before he became connected with the show business, was a law clerk and court reporter. His health broke down and he was compelled to seek outside employment. For a while he was business manager for a road show. Then he was in turn assistant director, buyer and purchasing agent for a film company. This was in Philadelphia. Later he was sent out with a traveling film company. On this trip Mr. Wells gained the experience to qualify for his present position. The duties of the manager of the property department at a studio the size of that which claims Mr. Wells are multifarious. He not only has charge of all the properties used by the dozen companies working out of the studio but he must house and feed the companies that are out on location. He also has charge of the fleet of motor trucks maintained by the company and must see to the transportation of the actors and supplies. He is responsible for the issuance of the supplies from the immense warehouses in which they are stored. Under him are dozens of set dressers, warehouse men, truck drivers and laborers.

HOWARD S. WELLS
Property manager of a large California studio.
Top, right: the drapery department, a section of the property department.
Center: section of property room. It contains what are known as "hand props."
Below: property department, upper section, of same dimensions as lower floor.

As soon as it is decided to film a certain story, the scenario—or a copy of it—is turned over to Wells and he makes a list of the properties required. The assistant director is also required to make a list and this is compared with that prepared by Wells. This double check is very important.

Suppose, for instance, that a company is in the mountains or in the desert. The absence of one property which the property man has forgotten or overlooked might cause a delay of several days. Such delays would run into thousands of dollars. The old days are past, and efficiency and accuracy are the watchwords. He must be a man of infinite resource as well as of practical knowledge.

A set dresser—as the name implies—dresses the set—distributes the articles that belong to a set. He works under the direction of the assistant director. He comes in after the carpenters and painters have finished their work and is the last man on the scene before the actors and camera arrive.

Small articles that can be carried about by the actors, such as guns, suitcases, and so on, are called hand properties and it is the duty of the set dressers to keep a vigilant eye on these to see that they are on hand when required. Every article required by a director in filming a picture is charged against his company. A requisition is issued through Mr. Wells's office for each property required. The requisition is placed on file and the article charged against the director ordering it. Every property thus issued must either be returned or a proper accounting made for it.

Notwithstanding the careful check kept upon properties the seepage runs yearly into large figures. Actors are proverbially a happy-go-lucky folk with most inconsistent ideas of thrift, and the motion picture variety is no exception. They are not only careless with the property of their employers but they take no better care of their personal belongings. Mr. Wells says that there is seldom an evening that the set dressers fail to bring in an armful of wraps, overcoats, canes, bags and so forth that have been left about the set when the day's work is over.

Much of the bric-a-brac used in interior sets is valued into the thousands of dollars and actors and actresses who furnish their own homes often gaze at it with covetous eyes.

Nor is their longing always confined to mere gazing. A property man at a certain studio, which shall be unnamed, told me of tracing several valuable vases and draperies to the home of a well-known star and there incidentally the articles still remain.

A careful check must also be kept upon costumes, furs and other articles of wearing apparel.

Breakage is another cause of loss. In certain plays and especially comedies the destruction of properties is part of the action and although such articles are constructed as cheaply as possible the loss often runs into big money.

Roscoe Arbuckle, known to the picture fans as Fatty Arbuckle, and Wallie Reid are two comedians who cause Mr. Wells a great deal of anguish through their destructive propensities. Although the other spectators may be rocking in mirth at the antics of these laugh provokers, Mr. Wells fails to see any humor in breakage that is charged up to his department. He says that being a property man has spoiled most pictures for him because he gets to figuring up the loss and can't keep his mind on the story.

A walk through the vast storerooms is certainly illuminating to the uninitiated. One entire building is devoted to period furniture, another to draperies and another to bric-a-brac which embraces everything from antique vases and statuary to oil paintings copied from the old masters. In one room are dozens of immense chandeliers and ornamental lamps. In another are swords, guns and side arms dating from every period in history from the remote ages to the present. A particularly interesting collection at Universal City embraces every vehicle from the one-hoss shay to the modern limousine.

The property men of the various studios about Los Angeles, where two-thirds of the motion pictures of the world are made, work harmoniously and borrow and rent various properties from each other.

The advent of the motion picture has created a number of new businesses in Los Angeles. Not only are there several establishments that rent exclusively to the studios but some of the large retail furniture houses and department stores have rental departments devoted to supplying the needs of the film colony. The visitor may also see the unusual spectacle of antique shops refusing to sell their curios to collectors because they prefer to rent them to the studios. This is easily explained, however, when the rental price of certain rare antiques is learned. While expense is the bugbear of the property man it is the least of the worries of the directors and some of them will go to any extreme to get just what they want for a certain scene.

But even with the dozens of antique dealers scouring the remote spots of the earth the property man often runs against what seems like a hopeless impasse. It is then he must bring his ingenuity into play.

For instance, Mr. Wells told me of a particular scene that was supposed to be laid in Scotland. In a city like Los Angeles where the architecture embraces every variety known to civilized man it was easy to find a house that would pass for a Scottish manor.

But the rub came when Wells learned that he must supply a lawnmower for the principal character in the scene to operate on the lawn. An English lawnmower differs in several particulars from an American machine. There was not time to send abroad for one and as far as Wells knew there was none in this country. To make it worse Wells had never seen one of the foreign grasscutters. With the aid of the research department Wells finally found a book containing a picture of an English lawnmower. He studied it carefully, took an American lawnmower and made it over so that an expert could not distinguish the difference when it was shown on the screen.

This is only a sample of the painstaking care with which pictures in the larger studios are filmed. It explains why so many persons who have been abroad have been fooled into exclaiming, "Why, I know that was taken in France because I have been on that very spot," when, in reality, the scene was shot in California. The pictures are made with such careful attention to detail that directors and property men who know every trick of the trade are often imposed upon.

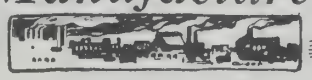
The research department is the prop that Wells leans upon in times of doubt. Three persons are employed who do nothing but look up the proper costuming and settings for scenes laid in times other than the present. In addition to a large library maintained by the studio they have the public library of Los Angeles to fall back upon as well as several splendid private collections of millionaire book fanciers.

As soon as a scenario is typed and the property plot is made up by Wells and one of the assistant directors it is turned over to the research department and the task of deciding the proper costuming and setting is begun.

Thus Wells does not set out blindly but he knows just what he wants to get. But getting it is another matter. Once he had to hire an entire circus for just one scene in a picture. Upon another occasion he engaged a carnival company to stage a three days' street fair.

Some of the hardest assignments that have been given him have occurred in pictures with religious themes. Certain sacred objects were required which it was impossible to beg, borrow or steal. How he managed to procure them would make an interesting story but, unfortunately, is a story which I am not at liberty to divulge.

Other departments that come under Mr. Wells's supervision are the large repair shops. In the drapery department curtains and draperies are constantly being altered, cut and repaired. Furniture is revarnished, repaired and reupholstered. In the pottery department antique vases are duplicated in cheaper materials and the bric-a-brac that is to be smashed in comedy and battle scenes is made out of plaster of Paris. Costumes require a large force of seamstresses to make and alter. The electrical department requires a large force of electricians and expert mechanics are employed in the upkeep of the fleet of motor trucks and automobiles.



I think that the reader will agree that Mr. Wells not only deserves the corporation manager's salary which he draws for his services but is also entitled to any super appellations which we may have given him.

The Three Arts

Agriculture — Manufacture — Transportation

It has been discovered by government scientists that if apples are wrapped in oiled paper they will be protected from scald. It is expected that many growers and shippers of fancy fruit will make use of the discovery this year.

Preliminary reports on British trade for 1920 have been received by the United States Bureau of Foreign and Domestic Commerce. According to the statement issued by the bureau the report shows imports of the United Kingdom as £1,936,742,120 and exports (including re-exports of £1,557,974,984), making the total foreign trade for the year £3,494,717,104, against £2,589,540,889 in 1919 and reducing the unfavorable balance of trade by £284,000,000 compared with the earlier year.

Specialists of the United States Department of Agriculture examined 22,063,299 cattle during 1920. The inspections were made in the course of supervising interstate transportation of live stock.

According to the returns of the fourteenth census, Vermont has 29,075 farms, or 3,634 less than in 1910.

The domestic production of copper during the last year totaled 1,753,000,000 pounds.

Vast quantities of Canadian wheat are moving from Vancouver to Europe through the Panama Canal.

Drinking water on railway trains is now being tested regularly by Federal and state officials. Similar protection against disease will soon be afforded passengers on steamers sailing from American ports.

Kansas is shipping large quantities of corn to the famine districts of China.

Cotton growers from the Mississippi delta district have organized and will sell cotton on the plan followed by California fruit growers.

The Montana Wool Growers' Association will manufacture one thousand pure wool blankets and market them in the state of Montana as a test of the advisability of having the association embark in the business of manufacturing woolen products.

The entire reclamation system of the United States has cost but $123,178,779.77.

During 1920 the United States exported timber, lumber and other forest products to the amount of $200,000,000.

The railways of the nation handled more coal in 1920 than in any year except 1918, when war demands called for an exceedingly large part of the country's supply.

The greatest need of Mexican railways is for equipment and rolling stock. The roads lost 10,000 freight cars and 400 locomotives during the revolutionary upheavals of the past few years.

The price of railway locomotives in 1920 was two and one-half times the price paid in pre-war years.

It is stated by authorities on transportation that gross railroad earnings per train mile increased 209 per cent in the 10 years ending 1919, but that expenses increased 323 per cent.

Cable dispatches carry the information that a large British industrial commission is visiting Brazil for the purpose of attempting to make arrangements to supply the British market with Brazilian cotton.

The Department of Agriculture expresses the fear that southern farmers will plant too heavy an acreage to alfalfa during the present year. The department asserts there must be an increase in live stock before the alfalfa acreage can be profitably increased.

American consular reports carry the information of the formation of a Finnish company which has perfected a new hydro-turf method of making and drying peat fuel. Work will be carried out on a huge scale.

According to reports issued by the Department of Agriculture, there has been a pronounced increase in the number of cow-testing associations in the United States during the last year.

The state of Michigan offers a reward for planting nut trees beside highways.

Dr. John R. Mohler, chief of the Bureau of Animal Industry, has issued a statement in which he declares that owing to the readiness with which the virus is carried in the bodies of animals, in hides and other live stock products, the United States is dangerously exposed to invasion by foreign animal diseases now very prevalent in Europe and South America.

Tests made to determine whether American potatoes were susceptible to the "wart disease," a European blight which has recently appeared in this country, revealed the fact that there are 26 American varieties which are immune from the disease.

Idaho farmers report great success in killing rabbits with strychnine. The farmers of one county averaged 1,000 rabbits to every ounce of the poison.

The Geological Survey estimated that an average of 95 tons of soil, pebbles and loose rock for every square mile of the United States are carried into the sea by our rivers every year.

Nationalization of coal, fuel oil and water power lands has been advocated by the Secretary of the Navy.

New York consumes 1,600 cattle, 1,688 calves, 2,147 sheep, 1,933 lambs and 795 hogs daily.

The Wealth of Nations

The estimated wealth of the United States today is three hundred billion dollars, a gain of fifty billion since the outbreak of the Great War in 1914. It should not be thought, however, that this country alone profited during the war, for the estimated wealth of Great Britain is placed at two hundred and thirty billion, an increase of one hundred billion since 1914. This gain is due to the wealth obtained through the acquisition of Mesopotamia oil fields, the African territory taken from Germany and the free field left to Britain for the time being as the result of Germany's elimination as a trade rival.

Likewise the wealth of France, estimated at one hundred billion, has increased thirty-five billion since 1914. Italy and Belgium are reported to have added one-third to their wealth and Japan about fifty per cent.

On the other hand, Germany's wealth is said to be down from eighty-five billion to about twenty billion while Austria is said to have dropped from forty billion to one billion.

Implement journals state that there will be no reduction in the price of farm implements during the present year.

Private American shipyards built 1,758 merchant vessels of 2,832,343 gross tons for American shipowners in 1920.

The Brazilian embassy has announced that the population of Brazil is now more than one-fourth that of the United States.

The Pennsylvania Railroad has put in operation a plan for averting breaks between engine and train service employes.

At a joint convention of the Louisiana Bankers' Association and the Louisiana Division of the American Cotton Association it was decided that bankers would refuse credit to cotton planters who fail to reduce their acreage by one-half this year. Merchants are also asked to refuse credit to those farmers who fail to co-operate in the movement.

Montana has 2,136,974 acres of land under irrigation.

American steamship companies on the Pacific have informed the crews of their ships that present wage agreements will be abrogated and that wages will be reduced. Wages on the Pacific are said to have been slightly higher than on the Atlantic.

The Gulf Coast Lines are spending $2,500,000 for new equipment. Five locomotives, 850 freight cars and 4,000 tons of 85-pound steel rails have been ordered. The new rail will be laid between Houston and New Orleans, replacing lighter rail now in use.

The Michigan Live Stock Breeders' and Feeders' Association has asked the state legislature for a law requiring inspection of all cattle offered for public sale in Michigan.

C. J. Tilden, professor of engineering mechanics at Yale University, has been granted leave of absence for a year in order to accept a position as director of highway and highway transport education committee. The committee includes representatives of all governmental, educational and industrial groups interested in the advancement of highways.

Wall Street reports rumors that officials of some of the great railroads of the country are considering offering stock to employes.

Imports of Brazilian coffee through the port of New Orleans in 1920 exceeded all previous records by more than 60,000 bags.

French railroads suffered a $900,000,000 deficit in 1920.

Representatives of the Argentine Government have adopted the methods used to wipe out hog cholera in the United States and are using them with success in their work.

In carrying out its studies on farming costs, the government has procured records from 481 wheat farms, 846 cotton farms and 175 sugar beet farms. Investigations to determine the cost of raising cattle are now in progress on several hundred farms.

English railways handled more freight and passengers during 1920 than any previous year in their history.

Approximately 62,000 acres of the 148,000 acres devastated by war in Belgium have been restored to a condition which permits cultivation.

During 1920 there were reported 6,000 violations of statutes intrusted to the Department of Agriculture for enforcement.

The government has completed a survey of the results accomplished by 250 community centers in farming sections.

UNIV OF ILL LIBR
URBANA ILL

Briefly Told

The tree on which Daniel Webster hung his scythe after deciding to go to Dartmouth College has been given a place in the Hall of Fame for trees with a history.

Sixty per cent of the world's output of copper is controlled by the United States.

Government figures show a surplus of more than one million women in England whose only hope of marriage depends on their migrating to other countries.

The wild burro of the Grand Canyon of the Colorado has been declared a pest by the United States Government. The burros have destroyed the trails and denuded the pastures of grass so that native wild game, such as antelope, has been forced out.

Residents of Tahiti express indignation because motion pictures, magazines and Sunday supplement pages depict the native Tahiti women as wearing few clothes. Missionaries changed the style of native dress long before the present generation was born. The average native woman is dressed in a mother hubbard.

A famous French statistician reported to the French Parliament that 8,501,437 men died in the war between August 2, 1914, and November 11, 1918.

It is estimated that 5,000,000 of the better class of Germans are planning to depart for Brazil, Argentina, Mexico and the United States.

If the government will remove the tax on the poorer grades of tobacco it will permit at least 25 per cent of the 1920 crop to be manufactured into fertilizer.

Rats of Nolan County, Texas, are eating the growing grain and the bark from trees six feet from the ground.

Six factories of Missouri manufacture corncob pipes for use in the United States and abroad. Last year the sales ran close to one million dollars.

German scientists have discovered that the roots of the ordinary bullrush contain as high as 30 per cent of cane sugar. Secondary processes yield alcohol and a nutritive cattle food.

The Douglas fir of Central British Columbia exudes a liquid at the tips of the leaves which when dry appears in white masses of sugar. The Indians of this region never fail to lay in a supply for the winter months.

Of our virgin forests one-sixth remains.

Natives of the Philippine Islands make substantial bridges of bamboo.

The Indiana house of representatives voted recently to bar all lobbyists from inside the railing of the hall of the house between the hours of ten in the morning and the time of afternoon adjournment.

Foreign claims filed with the Mexican Government for losses suffered during the revolution total $11,000,000. Claims were presented by five thousand individuals.

Rhodesia is doing its bit toward the returned soldiers and sailors. It has set aside five hundred thousand acres which is allotted free of charge to approved settlers from overseas.

Eighty per cent of the motion picture playhouses of this country still remain small structures seating but three or four hundred.

On the ground that it is an "affectation and a reminder of the monarchical days" the wearing of monocles by officials or members of the Berlin security police is forbidden in an order issued recently.

A Negro state bank, the first of its kind in the state, was recently opened in Chicago. The bank is operated for and by Negroes and has a capital and surplus of $125,000.

The farmers of America, through the American Farm Bureau Federation, declare they are willing to furnish 25,000,000 bushels of corn to the starving of China and Europe if the railroads, milling and corn products interests and others will transport it to the famine victims.

Three hundred million gallons of gasoline evaporate annually between the wells and the refineries. This amount is only about half the total evaporation loss and of this total at least half is preventable.

The people of the United States spend $200,000,000 annually on tobacco.

The Louisville & Nashville Railroad will install wireless outfits to transact railroad business. Train dispatches will not be handled by wireless.

The American cotton crop for 1920 was 12,987,000 bales.

There are 115,000 tubercular children in Vienna, of which 16,000 are in urgent need of surgical treatment.

More than 2,000,000 acres in this country were planted with peanuts during 1920.

A seed potato cutter has been invented which cuts two potatoes at a time into four pieces each.

Insects annually kill standing trees valued at $70,000,000.

The natives of Guam use the pounded fruit pulp of a native tree to stupefy fish which they use for food. The fruit pulp is inclosed in a bag and sunk in the deep holes of the reefs and the intoxicated fish soon appear on the surface where the natives scoop them into their boats.

The present population of Brazil is one-fourth that of the United States.

The United States produces more copper than all the other nations combined and more iron than any other nation in the world.

Sanitary engineers of twelve southern states use the top minnow, a wee fish, to aid in controlling malaria and to destroy mosquitoes. These fish swim near the surface and devour thousands of the mosquito larvae.

If experiments of the Navy Department prove successful, naval airplanes, instead of "taking off" from the decks of ships at sea, will be hurled from catapults. Plans are also under way to make collapsible planes.

According to the figures of the Reclamation Service the amount of lumber required to make boxes for Washington's 1919 crop of apples was sufficient in quantity to build 9,660 country houses, each capable of sheltering a family of five persons.

Either of the two American fleets, the Atlantic or the Pacific, is far greater than the famous fleet of the United States which sailed around the world in 1907-1908.

A naturalist and tree surgeon of Cambridge, to observe to the best advantage the intimate family life of his feathered friends, the birds, has slung his hammock high in the tops of the tallest trees where he sleeps each night during the warm weather. Another advantage is that he is never bothered with mosquitoes at that altitude.

The permanent snow fields of Alaska are less than one per cent of Alaska's total area, and only cluster around the crest lines of the highest mountains.

It has been reported by Arctic explorers that Polar bears have been seen, hale and hearty, swimming in the open ocean all the way from forty to eighty miles from any land or other landing spot.

Tokio is planning to have a floating crematory which consists of two specially constructed vessels with facilities for cremating 30 bodies at a time. After funeral services have been held on board the boats will leave for a point seven miles off the bay for cremation.

Profiteering? No! Profit? Yes! in 20c Cotton

WE AGREE with Mr. Harry H. Dunn, the writer of this story, who, in a letter to the editor, said, "I am sending you herewith what I consider the most important industrial story which has broken in the South since I have been here, which is to say, seven years."

We anticipate that this article will create a storm of discussion. This is why it is being published. Recently we read of meetings in the South in which it was determined by the southern bankers that credit would not be extended to any planter who planted more than half of his acreage to cotton in 1921. This action obviously was taken to hold up the price of cotton, and, to quote those in the movement, "prevent ruin of the cotton planters." But there is another side to the story, and it is this we are telling in the Dunn article. We expect that many will disagree with it, but the facts are indisputable. *There is a fair, legitimate profit in twenty-cent cotton.*

Would Turn Port Over to Private Capital
Today, after fifty years' trial, New Orleans confesses public ownership of port facilities a failure.

Annual Insect Bill More Than Two Billions
Wanton slaughter of birds is proving one of the most costly mistakes ever permitted by government.

Editorials **Three Arts** **Mr. Ford's Page** **Illustrations** **Briefly Told**

Many Men of Many Minds

Herbert Hoover.—We will have ground for despondency when we fail to secure that impulse of charity and of economic assistance by which our surplus can be placed in the hands of the needy.

Ethel M. Smith.—To ground arms is the first step toward actual peace. As working women we pay for war with both our labor and our heart's blood. Our women know the frightful waste of war.

General Leonard Wood.—We must see to it that this country is not flooded with undesirable immigration and that great numbers of people who have been engaged in destroying government, who have no sound ideas of government, are not allowed to crowd into this country already overloaded in many sections with unassimilated material.

William Philip Simms.—War between the United States and Japan would be criminal folly. Such a thing I for one do not believe to be within the range of remote probability. The questions at issue between the white and yellow races may be full of difficulty, but I am confident that a solution of all of them will be found through mutual understanding and trust.

Calvin Coolidge.—States grow and there is an inexorable law of their growth. They must go through the process step by step. There is no hiatus in their development. Liberty is not bestowed, it is an achievement, but it comes to no people who have not passed through the successive stages which always precede it.

F. B. De Berard.—Government service, with its rules and regulations, is quite different from private business, where the organizations are keyed up to the single objective of good financial results, with its attendant demand of the highest degree of efficiency.

A. F. Tinojo.—Despite certain individual national misunderstandings with the Washington Government, such as those in Mexico and Colombia, there never has been a time when the United States, Americans, American ideas and American ideals were so popular in southern republics as they are today.

Frederick A. Wallis.—The immigrant is here, has always been here, will always be here. Like a mighty river flowing to the ocean is the irresistible stream of eager and picturesque immigrants flowing daily through Ellis Island. No sooner have they landed than they scatter to all points of the compass, most of them going to the cities. According to good authority, the territory where nearly 80 per cent of them go is well defined. If a line were drawn from the northwestern corner of Minnesota down to the lower corner of Illinois and then eastward to the Atlantic Ocean, passing through the cities of Washington and Baltimore, it would cut off less than one-fifth of the area of the United States. But contained in the portion marked off, there are located more than 80 per cent of the immigrants coming to this country.

Immigrants Huddle in Cities in the Northeast

David Wark Griffith.—Of the 106,000,000 people in the United States, it is safe to say that practically all are interested in the films in some way, either watching them, censoring them, or trying to write or act them. And sometimes it seems that the three latter classifications outnumber the first.

Cicely Hamilton.—Those who belong to the fighting half of humanity have the right, if they will, to belittle the emotion which impels their fellows to offer their lives for a cause; but if the protective instinct, the sense of the supreme value of life, were a reality in woman—an effective reality—their opposition to war would come from a different motive; it would come from a sense of the splendor of the sacrifice and the unworthiness of society—their own unworthiness—to accept it.

Ex-Crown Prince Frederick Wilhelm.—Naturally I would be glad to return to Germany, and I would be happy if I could devote myself to agriculture, particularly to horse-breeding, but that cannot be.

Rear Admiral Albert P. Niblack, U. S. N.—Although the American people shrink from foreign entanglements they have made up their minds that they are going to take their rightful place as a maritime people.

David H. Holbrook.—If the battalions of devoted social workers in America who are daily giving their best efforts to constructive undertakings for the public welfare are to maintain their position in the advance corps of social progress, they must increasingly find within their calling a thing difficult to attain, namely, professional spirit.

Don C. Seitz.—While millions of men suffered death and the agony of wounds and fever, other millions profited for the time, fattening upon necessity, "gittin' while the gittin' was good." They shouted patriotism and picked pockets during the confusion. This was called by some, in justification, "the redistribution of wealth." It was, but it was not the same wealth as before; it was diminished in quantity and poorer in quality.

Glenn Frank.—It is not low pay alone or primarily that is causing the exodus from the teaching profession. The myth of dignity has been blasted. As President Davis, of Hunter College, has said: "The claim that teaching is more refined, has shorter hours, involves less strain than office work is pretty well exploded." The necessity of self-support is causing teachers to demand better pay, but self-respect is causing them to demand self-government. This is the next step.

Myth of Dignity Is Gone From Teaching, He Says

Narcissa Cox Vanderlip.—The great thing to work for in the coming years is world brotherhood, intelligent understanding, peace throughout the earth, and good will to men of every color, race and language. We must cease to talk up the next war with Mexico, Japan, England or Ireland. We must lead the way to disarmament and cease spending 88 per cent of our national moneys for wars.

Edward N. Hurley.—If we must join and organize, let us organize to promote individual initiative—to do more and to get more and to increase the sum of human happiness. Then I think we shall find less necessity for organizing to solve problems. We shall not have the problems to solve. We shall have our work and our leisure and will distinguish between them. And I think we shall be happier.

Sisley Huddleston.—Germany may be thinking of *revanche;* for aught I know there may be a Second World War when the weather clears up a bit; but if we are obsessed with this idea our brains will suffer. It is a cheerful fact that France refuses to sacrifice her sanity, and that for the first time a premier has had the audacity to declare that she is in no danger.

Joseph A. Faurot.—One need not be a pessimist to recognize that the schools are without direct influence in diminishing the number of crimes committed. The saying that for every school which opened a prison would close has never held true in fact. The only education which has influence upon the child as to criminal tendencies is that afforded by *examples of conduct and by environment.*

George Eastman.—I think that every man ought to be qualified to support himself at more than one kind of a job. In ordinary times you see people walking the streets, not because there is no work to do, but because they know how to do only one kind of work. It is, I admit, sometimes extremely difficult to work out a supplementary line of endeavor, to have another way of getting at the same or a similar result; but it is rarely impossible.

B. C. Forbes.—Saving is no magic key to certain success and a great fortune, but it does manifest, particularly when carried out under difficulties, a steadfastness of purpose which is necessary to the achievement of high ambitions.

John H. Glenn.—In my judgment there is only one thing to do with immigration, and that is to keep out the criminals and undesirables.

Gilbert K. Chesterton.—The modern politician is a mere flunkey to the modern millionaire.

Sir Hall Caine.—We shall not and cannot compete with America in building warships. If America wishes to have the greatest navy in the world, she can well afford to have it and we must not try to question her right to it.

Francesco Nitti.—If some great human voice does not rise above the conflict of minds to point out the way to true peace, the terrible decadence of Europe will be still more accentuated.

Sir Rabindranath Tagore.—The League of Nations is a League of Robbers. It is founded on force—it has no spiritual foundation. Humanity is not yet ready for it.

Guglielmo Ferrero.—In the center of Europe there is no more justice today than there was before the war, because there are still oppressors and oppressed; but there is much more hatred and much more fear. Hate that generates fear and fear that generates hate.

Anthony Caminetti.—My visit to Europe has illustrated to an extent I never realized the supreme importance of our immigration service and the necessity to connect it with the emigration activities throughout the world by proper avenues for information.

Alvaro Obregon.—I believe that when the United States and other nations see we are carrying out what they justly demand, they will consider the embodiment of those demands into a treaty unnecessary.

Dr. Payson Smith.—In asking for more for our schools, we are going to be met with the plea that owing to high costs we must retrench. Our task then is to place before the people the facts, and convince them that their expenditures for education are not extravagances, but are investments.

Governor Channing H. Cox.—The solution of our economic, social and commercial problems depends in great measure upon education and upon the educational leaders of our country.

George Pattullo.—I am well persuaded that when masses of men start out to gain their ends by violence they fail of their purpose ninety-nine times in a hundred. Even when their object is the laudable one of ousting a vicious system those who make the sacrifices in the effort reap no real benefits. They merely topple one set of exploiters to install a worse, for violence is ever the rascal's opportunity. I am strong for the under dog's struggle to get his share of what the earth offers, and am far from believing that he has yet realized it; but I cannot find where he has ever won his objective through violence and cannot believe that he ever will. Indeed, violence is precisely the chance Greed is looking for to cheat him out of his dues.

Violence Never Wins in Fight by "Under Dog"

Governor Edwin P. Morrow.—Today the power of the state to enforce law and maintain order is brazenly, notoriously and impudently challenged by the scandalous and open violation of the prohibition law. Confronted with this situation, I call to the conscience of the commonwealth.

Harry A. Franck.—The scarcity and indifference, not to say insolence, of servants and workmen constitute one of the serious problems in the Argentine, as in all countries of thin population and many opportunities.

Lothrop Stoddard.—India is nothing short of a miniature world. Sundered from the rest of Asia by the stupendous barrier of the Himalayas, and washed on its other two fronts by the ocean, this huge triangular sub-continent, as large as all Europe except Russia, is inhabited by all sorts and conditions of men.

Sir Philip Gibbs.—The United States will join the League in some way or other, I am certain, and that will give it at once a new reality, for the American people are realists and not afflicted with diplomatic timidities.

Shall the United States Abolish Sunday?

One Day of Rest in Seven Is the "Core of Civilization." Mark the Greedy Un-American Influences That Seek to Break it Down.

"It will be impossible to preserve a weekly day of rest without an appeal to the religious principle, and I regard such a day as the corner stone of civilization." —Benjamin Disraeli

THE Sunday Question has recently received new prominence, but anyone who has practiced the art of observation during the past two decades must be aware that it has been pressing a long time for attention. We have fallen into the stupid habit of thinking that a problem is not a problem until the newspapers take it up; but real problems usually predate and outlive newspaper discussion, as the Sunday Question certainly will do.

A great deal that has been said about Sunday freedom and Sunday observance may forthwith be put aside, because it means nothing, and its only effect, whether its purpose be so or not, is to darken counsel with words.

Likewise many of the debaters can be put out of court. The minister who wants to swagger as a "liberal" and gain the cheap applause of the enemies of the Sabbath by letting on that he is not straight-laced about it; the Sabbath condemner who seeks to gain his point by poking fun and making scurrilous jests against the people who religiously observe the day—these are two who may be taken by the collar first, and shown the door. There are others who will wisely follow of their own accord. The Sunday Question shall not be made a "popular topic" with such types of people. It is too important. It is too vitally American in its implications.

The first thing every intelligent man should do is to *fix his mind attentively on the fact of Sunday.* It is one of those miracles and mysteries which are too close to us for proper appraisal.

The Day That Divides the Weeks

ONE who comes a stranger to our shores from the great countries of the Orient receives his deepest and most abiding impression, not from the week days' rush and roar, but the miraculous suddenness with which it ceases One Day in Seven. Six days of buying and selling, rushing and crushing, making the news and circulating the news, hearing lawsuits, fighting political campaigns, and following the noisy multitude of other activities that make up our lives—six days of energy and turmoil, of dust and clatter, of achievement and defeat. And then—Silence! Bank doors locked. Blinds drawn in store windows. Railroad schedules reduced. Schools and colleges closed. Courts suspended. Newspaper offices still. Great factories silent, with banked fires. Markets empty. Working clothes laid aside. The morning whistle hushed.

Between the weeks a Day—and why is it there? Did you vote for it? Did your party propose it? Did your government add it to the list of the inalienable rights of man?

There is the weekly rest-day: consider it. How did it come there? Do you know?

The *year* is marked by *Nature.* The *seasons* are marked by Nature. The *month* is marked by Nature. But you will not find the *Week* in Nature. This custom of counting by seven days, where did it originate? Learned men have dodged round the question with great ingenuity, but when they have said their say you have the impression that savage tribes knew a great deal about astronomy and mathematics—which knowledge, strangely enough, serves only to challenge the singularity of the Weekly Day of Rest, but of no other modern thing. Savages are very useful, in the imaginations of scientific men, to belittle certain modern observances, especially if these have a religious connotation. The savage learned from Nature. There is no *Week* in Nature. Where did Sunday originate?

No "Economic Reason" for Sunday

"ECONOMIC reasons," mutters another class. "Got to have rest; couldn't keep up if we didn't; Sunday written in the constitution of the human race."

That is strange, since teeming millions of the human race have not found it so. There is China, for example; a rather sizable country with an intensely busy population. But China has no Rest Day. Indeed, China has been used to prove that Labor can do without One Day in Seven. A very intelligent observer writes: "Some persons have expressed their surprise that the unceasing round of toil which the Chinese laborer pursues has not rendered him more degraded. *It is usually said that a weekly rest is necessary* for the continuance of the powers of body and mind in man in their full activity, and that decrepitude and insanity would often result were it not for this relaxation. . . . Yet, in China, people who apparently tax themselves uninterruptedly to the utmost stretch of body and mind, *live in health to old age.* . . . Nothing like a seventh day of rest, or religious respect to that interval of time is known among the Chinese. . . ."

"Well," mutters our devotee of the economic argument, "Chinese are not industrialized. Look at some industrial nation."

Very well; look at Japan whose industrial development during the last quarter of a century has lifted her to the status of a modern power. The working men and working women in Japan are theoretically allowed one day in 30, not as a right but a favor—but they don't get it! So strong is the impression made upon Japan by western influences that Sunday *has* come to Japan, *after a fashion*—the banks close on Sunday, because British and American interests will not do business on that day. But the artisans, the farmers, the laborers do not know, and never have known, a weekly day of rest. Industrialism does not create it. As a matter of plain fact—and our economic friend ought to know it—industrialism and commercialism have been the most insistent encroachers on the One Day in Seven. Where industrial rapacity has had its way, Sunday has been wiped out altogether.

The only government that ever made radical Sunday legislation did so to destroy Sunday.

The French Revolutionaries, in their insane desire to abolish everything that savored of Christianity, decreed the "decade," a ten-day week instead of a seven-day week. They actually decreed it! This was in 1793. It never took hold. Napoleon eventually rescinded the "decade" legislation. But the legislation stands in history as an example of what "advanced liberals" will do.

The only sanction that Sunday has is a religious sanction; nothing else maintains this Day in the midst of the rushing weeks that tear breathlessly along until 12 p. m. every Saturday as if nothing on earth could stop them, but which yet find themselves halted by the silent dawning of that One Day in Seven.

And the chief beneficiary of that Day is the plain man, who labors for his bread, whose theoretical rights are many and whose actual rights are few—he has the *right* to 52 days a year, *more than seven weeks of time,* to himself. The Sunday is here. None of us voted it here. Millions have tried in their ignorance to drive it away. It is here, and its blessing falls upon every son of toil.

Now, the Sunday Question is simply whether we are to keep Sunday or abolish it.

The Principle Depends on Sunday

SOME say, "How about Saturday?" There is nothing to say about Saturday, nor even Friday—which is a Mohammedan day, not of rest, however. If a man prefers to keep even Wednesday, he is at perfect liberty to arrange his life so that all the weeks will wheel about Wednesday.

But the United States is a *Christian Nation.* Let no one have any doubts on that score. So far as nationality can be religious at all, the United States is a Christian Nation, so declared by the United States Supreme Court. The freedom extended to all forms of faith and of no-faith in this country does not argue the any-faith or no-faith of the United States: *it is Christian to its roots.*

This is stated thus emphatically because there are influences which would take advantage of a certain popular ignorance with the assertion that the United States is *not* a Christian Nation. It is, officially and actually. And will always remain so.

Now, Sunday is distinctively a day of Christian observance. Granting the previous existence of the Jewish Sabbath, granting the existence now of Sabbath-observing Christians, the fact remains that the great principle of One Day in Seven has been kept alive by the Christian Sunday, more accurately called The Lord's Day, and that the principle of One Day in Seven is strengthened or imperiled as Sunday observance is strengthened or imperiled.

This is where the "narrowness" comes in. But principle is surprisingly narrow betimes, even as it requires a microscope to find the deadly germ. The United States is tolerant in its spirit, but it is specifically Christian in its allegiance; not Jewish, nor Mohammedan, nor Confucian, nor Buddhist, though it shelters and gives freedom to adherents of these faiths. Sunday is its One Day in Seven, and this Day is founded on religious sanctions and nothing else.

To be completely "journalese" this article should contain several flings at the church people. But the flings shall be omitted, because the church people are the majority of the American people, and not only the majority, numerically, but the cream morally, mentally, socially—humanly. That is a secret which has not yet percolated into certain "circles."

The church people are to be credited with having kept Sunday on the calendar of the shop and store and office and mine and farm and factory. Close up the churches and everything else will open. Sabbath-breakers and jesters at religion should lift their hats every Sunday when, on their way to the golf links or the show, they pass a church; they should recite a little litany to themselves, like this: "Well, old Church,

"Sunday labor in the United States is, however, increasing. That the increase is general is shown by the growing opposition of the labor unions, and their frequent demands for shorter hours throughout the week, on the ground that they have no assurance of the Sunday respite."

—The New International Encyclopedia

"The Sunday is the core of our civilization, dedicated to thought and reverence...All civil mankind have agreed in leaving one day for contemplation against six for practice."—Emerson

I have to thank you for today, anyway." It would be only decent and fair.

The church folks gave the country the Day—gave it away back in time before the country was thought of; the church folks are keeping Sunday alive in the teeth of a thousand united foes that are seeking to kill it—AND—for that reason the church folks have something to say about it!

The motion picture men did not invent Sunday, and they have not contributed anything toward maintaining it. The Sunday bally-hoo men are not the originators or guardians of Sunday. The cheap johns of the jazz entertainment world couldn't tell you what Sunday signifies if their lives depended on it. Yet to hear them during the last few weeks you would think they had letters patent on Sunday and could snap their fingers in the face of Christian America. Perhaps—in New York; but not—in America!

Students of the wonderful new development of lying and subversive propaganda in this country have had a very complete example in the way the anti-Sunday propaganda has been handled through the newspapers. It would be pleasanter to say that the reports of what the lovers of America want to do were "garbled"; but that is not the word at all; it is too polite. A certain group of people have had entree for the most unfounded and slanderous material against the Christian American Sunday and its friends as well as other things American. And, fatuously, they think that securing that sort of publicity settles the question. This is, seriously, a question for newspapermen. How far is this sort of thing to be assisted?

A Working Men's Question

THE whole point of the new Sunday agitation is this: Sunday is being destroyed by interests that take everything out of the people and put nothing back into them for the betterment or refreshment of their lives. Sunday is a day of physical rest, not only, but of inner, spiritual refreshment as well, and there is a strongly organized attempt being made to prevent Sunday from serving either of these purposes. Whole huge sections of our working people have been roused into a fever of anti-Sunday delusions, and they, poor simpletons, are always the first to suffer from violation of the spirit of Sunday.

The more pleasure on Sunday, the more work. The more you break the spirit of Sunday, the more you break the body of Sunday. The more people enjoy what they call a "free" Sunday, the more are condemned to a working Sunday. It hits the workingman first. This being Christian America, no one would say, "You have got to go to Church." But the fact remains that the Sunday stands or falls with the number of those who do go to Church.

"Sunday recreation?" Certainly, that is what Sunday is for—re-creation, refreshment, restoration. Every one of them must be interior first. The refreshed body, the mind restored to its equilibrium—both dependent on processes which are not only retarded but made impossible by the commercialized Sunday. In any shop or office you can count on Monday morning those who accept the commercialized idea of "Sunday recreation" and those who accept the older, tested and saner idea. The former are fagged out; the latter are refreshed, they have derived some good from Sunday.

The advocates of a commercialized Sunday rest on Monday after counting their gains; but they do not even advocate Monday for the masses. Strange it is, calling for special note, that those who are most zealous for the maintenance of Sunday are those who get nothing out of it—commercially.

The Box Office Will Not Decide It

SUNDAY is the goose that lays the golden egg around the amusement parks and Sunday dance halls; but, like the story, the goose is killed by the greed this engenders. Extend and develop Sabbath-breaking a few more years, and there will be no Sabbath to break.

So liberal a man as Cardinal Gibbons, for example, is against Sunday movies. On what grounds? He says it is not recreational to crowd into a dark movie theater and subject the body to the physical conditions and the mind to the spiritual conditions of such places. And he is right. In the act of destroying the Sabbath, men destroy themselves also.

The Sunday Question will not be settled by the Box Office.

The Sunday Question will not become the sole property of the agnostics, Bolsheviks or any other class of non-Christian newcomers to this land.

The Sunday Question will be settled by the Christian Conscience of America, and that conscience has sound backgrounds. It built this country; it will maintain this country; and those who would enjoy this country must beware not to press its patience too far. In battle and in moral issues the United States has never been defeated.

Mr. Harding and the Navy

THOSE who are finding discomfort in Mr. Harding's statement that the American Navy must be maintained because they see in his remark a death blow to the hopes for a naval holiday are, we think, a bit premature in their judgment.

It is probable that there has been considerable misunderstanding of the meaning of a naval holiday. Undoubtedly there are many who have thought of it as a period of disarmament which would usher in an era when all the fighting craft of the world would be allowed to rust to pieces. In reality, of course, it has meant nothing of the sort. All that is suggested by the term is that the great nations of the world take a vacation in their navy yards; that they shut up shop and for an agreed period of time build no more warships. It is not suggested that the present navy be allowed to go to pieces any more rapidly than is occasioned by the normal rate of depreciation of fighting ships.

There is nothing in Mr. Harding's words, as reported by the press, which indicates that the President-elect is opposed to the curtailment of the present naval building plans. Indeed, Mr. Harding has indicated on previous occasions that he will sympathize with an equitable plan for the elimination of all competitive naval building programs. He has called into conference both Representative Butler and Representative Kelley of the Naval Committee. He is in possession of all the data on the comparative strength of the navies of the world. He knows exactly what it is going to cost this country to continue building ships at the present rate and present prices. He is likewise fully informed concerning the attitude of the country, as reflected by the press, for there have been few occasions when the newspapers were so united as they are in support of the proposal to cease naval building.

Under these conditions it is difficult to believe that Mr. Harding has determined to support the big navy enthusiasts. It is much more just to take him at his word and to believe that he meant exactly what he said when he expressed himself in favor of maintaining the navy, than to attempt to distort this statement into the announcement of a policy favoring an enormous increase in the navy. It is much more just and far more comfortable to take him at his word and accept the statement that he stands for the maintenance of the navy than to twist this into an announcement of a policy favoring a great "increase" in the navy. There is a vast difference between maintenance and increase.

Congress Does Its Spring Planting

IT IS estimated that the appropriation necessary to supply members of Congress with free seeds this year will total $360,000, or $120,000 more than the last distribution.

Just why these should be known as "free" seeds is a nice question and will bear considerable explaining, but in view of the larger question of why Congressmen should distribute seeds at all, it will probably be well to pass up a debate over this matter of terminology and get down to the more important one of taxes.

The facts are that the distribution of seeds by members of Congress is a wasteful and needless practice. The seeds go to hundreds of thousands of persons who do not want them, will not use them and who merely throw them away. Like the seeds of the sower of the parable, some fall by the wayside and are eaten by the fowls, some fall on stony places and wither away, and some fall among thorns and are choked.

Some Congressmen refuse to have anything to do with this travesty. They will send seeds upon request but not otherwise. The majority, however, consider seeds excellent campaign propaganda and use all they can get.

The public, which hears a great deal about economy and listens to a great many promises that public funds will be wisely administered, cannot but wonder why the distribution of seeds is not turned over to the Department of Agriculture where it can be handled intelligently.

Is it because these seeds are for votes and not for crops?

Mostly Fools

"THERE are several hundred millions of people in this world," once asserted Sir Bulwer-Lytton, "mostly fools." At first blush one is apt indignantly to refute this statement, but if we consider it in the right light, perhaps, after all, there is some truth in what he says.

The term "fool" is not here used in the sense of an idiot or imbecile, but is applied to the person who does something which is contrary to the laws of common sense and custom. An educated man, brilliant in his profession and looked up to by his associates, may at the same time be a fool.

A famous poet, whose verses and sonnets have gone down the years loved and remembered by millions of his fellows, came under the characterization of Lytton when he gave up the mastery of his senses to strong drink.

A writer of the same age was a fool when he allowed his brain to become so clouded and blurred through the use of opium, that he could no longer give to the world the great thoughts of a great mind.

The annals of history are filled with the tales of men and women who, while honored and believed in, through some act of indiscretion, some giving way to a secret sin, some stepping aside from the path of probity for a time, have fallen from the pedestal on which they were placed, divested themselves of the adoration of their fellows and become fools.

We see them all around us. We come in contact with them every day. We say sometimes in contempt, sometimes in pity, "He is a great man, but what a fool he has made of himself." A paradox, but true. But in our criticism of others let us not forget that perhaps we ourselves may be in the same boat. Which one of us can truthfully say, "I have never been a fool"?

When we contemplate the foolishness of mankind, it does seem as if Sir Bulwer was right when he asserted that the people of the world were "mostly fools," and the Bard of Avon when he said, "What fools we mortals be."

But out of the gloom which this reflection casts, there comes a ray of light. There are thousands of men and women throughout the ages whom the people of their time have characterized as fools, whose "foolishness" has made a bigger and better and brighter world.

When the Christian martyrs gave up their bodies to be torn by wild beasts rather than recant their beliefs, the people called them fools. When they allowed themselves to be burned at the stake for conscience' sake, "fool" was the title that was bestowed upon them.

When Columbus set sail on his voyage to discover and gain a new world, the people of Spain derided him and called him a fool, and when he at first returned unsuccessful, but determined to try again they thought him more of a fool than ever.

When Field proposed to span the Atlantic with a cable and transmit messages under the sea, thousands called him a fool.

When Abraham Lincoln signed the Proclamation of Emancipation striking the shackles from the arms of a million slaves, other millions of his countrymen said he was a fool to do such an act.

Many men and women who have dared to do something contrary to the dictates of custom, have been called fools by their day and generation. The man who refuses a business contract because it savors of dishonesty; the girl who declines to get married because she believes she should care for her parents; the preacher who remains in his present charge because he can do more good there, rather than take another church at a higher salary, all are thought to be fools by many people.

But it is this kind of fools that make a bigger and brighter and better world for the rest of us.

Long may their foolishness continue!

Freeing the Dinner Pail

EVER since President Roosevelt determined that the conditions in the big meat packing houses of the United States were such that government inspection was necessary and took steps to have such a law written on the statute books of this country, there has been a state of war between the Federal Government and the leading representatives of the packing industry. True, it has not always been active warfare, but there has never been more than a temporary lull.

That controversy, lasting over a long term of years, appears to be approaching a decision, for with the action of the Senate in passing the bill providing for Federal regulation of the packers, the forces of the government have administered to the packers a most decisive defeat.

There appears to be less doubt that the measure will pass the House than there was that it would succeed in the Senate so that, if the exigencies of politics are at all favorable, the present session will witness the conclusion of what has been one of the most bitter struggles between corporate wealth and public interests since the dawn of the era when private privileges were first made to square with the people's rights.

The present measure provides for a live stock commission of three members, appointed by the President, the duty of which is to exercise general supervision over the packing industry with all its related activities, such as stockyards, commission houses and other agencies, and to gather and distribute information of value. The commission will also have the right to examine the books of the packing companies when it deems such action necessary. While the bill does not go quite so far as was originally proposed, it is a very broad measure. Without providing for government control, it institutes government regulation. The commission will not fix prices, but it will be in a position to guard the public against overcharge because it will have access constantly to accurate information concerning profits, and through its ability to make conditions public will be sufficiently well armed to be the terror of profiteers.

The Federal Trade Commission, in the course of an investigation ordered by the President, discovered that the packing industry had spread out until it threatened to control the food of the American people. It discovered that the packers had gone into the cereal, fruit and fish business and that they were threatening to drive existing wholesale grocery concerns out of the field. Further, it reported that "it takes no imagination to see that in 10 or 12 years we will witness the disappearance of the retail grocers in a very great measure as independently operated business." The only conclusion which the commission could draw in such a case was that Congress must make up its mind whether it thought it wise to permit any industry to stand at the intersection of the crossroads of supply and demand and there to exercise the right to say whether or not the food of the country should be freely gathered and offered for sale under competitive conditions.

One result of this investigation was the order to the packers to divest themselves of all interests outside those directly related to the purchase, preparation, distribution and sale of meat and meat products. The second is the action of the Senate in passing the regulatory measure. Between the two it seems that there is about to be returned to the average citizen his right to be the dictator of his own dinner table.

Pictures and Prohibition

THERE are probably very few who will attempt to deny that the saloonkeeper was responsible largely for prohibition. He overstepped the laws so frequently and was so conspicuous as a leader of organized evil that society finally wiped out his trade to be rid of him.

The motion picture producers who are serving up cheap sex stories and who are crowding the market with these wares until it is hard to find a picture house that does not flaunt suggestive lithographs, are due to go the way of the saloonkeeper. The public will tire of their salaciousness and the result will be the passage of censorship laws of such severity that the picture business will have to be rebuilt.

The liquor business never listened to warnings until too late. It made the mistake of thinking that the only people who favored cleanliness were the people it sneered at as "reformers." It forgot that a man does not need to be a reformer to be a decent citizen. One can expect little, however, of the type that dominates motion picture producing today, save perhaps the few who, like Griffith with his "Way Down East," gauge the people's desires correctly.

Mr. Ford's Page

IT IS not with the distinction between reputation and character that this page deals today, although that distinction may well be kept in mind during its perusal. Reputation is what people think a man is; character is what he really is. Usually reputation and character go along hand in hand; what people think a man is, he is very likely to be; but not always. There are just a sufficient number of differences between men's reputations and characters, to make a sweeping statement impossible, except to emphasize the distinction.

One distinction not often thought of is this: the people make a man's reputation; the man himself makes his character. Reputation is repute. Repute is just what the people think over and over again; a repetition of thought, a multiplication of opinion. It is clear, then, that reputation is something the people give to a man. He himself, of course, must be sufficiently active or interesting or important to give the initial impulse to their thought; but, after all, it is their thought that paints his public portrait.

The public makes mistakes. It must have its devils and its angels, and its devils must be very bad, even as its angels must be very good. The hankering of the public after a good man to believe in is very pathetic. Being too wise to have anything to do with God, they set up a statesman, a philanthropist, a public benefactor of any kind, and then they begin to weave about him a romantic robe of dreams until he becomes a cross between Santa Claus and Gabriel.

No man is ever so good as the public wants its good idols to be; and no man is ever so bad as the public wants its bad idols to be. The reason is that the *public* gives repute, and not the man himself.

Reputation is, of course, an important point, but it is not of first importance. A man who is always careful of his reputation usually has not much to spare.

Reputations are such partial things anyway. Here is a man who has a reputation for ready wit. Another, during some retentive period of his mental life, stored up much knowledge of the sort which quickly turns to attic lumber—he has a reputation for learning. Another, because of some act performed in a moment of indignation, gets the reputation of being quick-tempered or courageous. Another, a normal man, not self-centered, but living free in mind and body, does for a friend, without thinking of it, an act involving danger to himself, but effecting the other's salvation. He awakes to find himself a hero. There is nothing funnier than finding oneself a hero. One has read of heroes, admired them, dreamed one's boyish dreams of emulating them, but we supposed that heroism was something very grand to feel. We thought the hero felt heroic, felt as heroic indeed as the hero looked upon the stage. But he doesn't. The hero discovers for himself the immense difference between reputation and the inner sense thereof.

It is only part of the man that is involved in the reputation, good or bad. G. K. C. has a reputation as a writer; but he is more than that. M. J. P. has the reputation of being a good mender of boots, professionally a cobbler; but he is more than that. Reputations are such partial things.

But it is only when reputations become something to trade upon that they begin to bind men.

There are some men who regard their reputations as assets, who ought to regard them as liabilities, and they are "good" reputations, too, in the moral sense. It is a mistake to think that it is the "bad" reputation that is always the liability. Not at all. Good reputations sometimes hang like millstones around a man's neck; they are, in reality, the millstones on which his epitaph is already carved. A man has a reputation for cautiousness. Well, cautiousness is only a partial virtue. Sometimes a man ought to be cautious, and sometimes greatly daring. Sometimes he ought to walk across the street and sometimes he ought to run. To commit himself to follow either course all the time would be equal to a prison sentence.

Other men have a reputation for what is called "common sense." Common sense is, as the term implies, the common possession of common people. It is very valuable. The majority of people are actuated by common sense. They are conservative. The majority *must* be *conservative*. That is the majority's *business*—to have and to hold, to protect and conserve the good of the past. If it were not for the conservative we should have nothing at all. He is the brother who stays at home and keeps the family farm in shape while his other brother roams afield, sometimes as a prodigal. In the end, all radicals come home to the conservatives; that is where conservatives justify themselves.

But, see what a hindrance a reputation for common sense may become. A man says to himself, "I have always been known as a man of common sense. I have always done what most people do, with an element of protective caution thrown in. People do business with me because they know I am 'safe and sane.' Yet, here I have a vision which I know is safe with a higher safety and sane with a higher sanity than any of my neighbors know, and I am moved to follow this vision—but if I do, bang goes my reputation for common sense!"

In such an instance, a reputation is the death warrant of a man's growth. He is not *living up* to his real self; he is *living down* to the self that he was twenty or thirty years ago. He is simply refusing to outgrow the features of the portrait called "reputation" which public opinion has sculptured in the gallery of public imagination. For that is all public opinion is, and that is all fame is, and that is all reputation is, just public imagination.

Too many men are afraid of being fools. It is granted, of course, that public opinion is a powerful police influence for those who need it. Perhaps it may be true that the majority of men need the restraint of public opinion. In this class of cases, public opinion keeps a man better than he would otherwise be—if not better morally, at least better as far as his social desirability is concerned. But doubtless there are cases, and many men feel the truth of it, where reputation keeps a man from being as good and as useful as he might be, because in service he would be led into the "unusual, don't you know."

Well, it is not a bad thing to be a fool for righteousness' sake. The best of it is that such fools usually live long enough to prove that they were not fools, or the work they have begun lives long enough to prove they were not foolish; and so the fool for righteousness' sake is revenged on Reputation after all.

Heaven help the man who has been poisoned by regularity! Not that belonging to the regulars, and being regular in everything from agriculture to religion is an evil thing—not at all. If a man deliberately chooses and selects a place among the "regulars" for the good that he can do them, very good. The regulars need their servants and prophets too. Many men are justified in saying, "I cannot do that, because it would injure the influence which I now possess in this special channel of work." There are men who, for the sake of moral usefulness among men, must make deliberate sacrifice of certain otherwise desirable things, and to these rightfully belongs their meed of honor.

This is not the class of men to be warned. These are not victims of regularity; they are missionaries to it. Others, however, who believe that the present form of regularity is the eternal pattern, who are in nervous fear of being so regular that they succeed only in being stupid, to them there might be given a stimulus to forego the bugaboo Reputation, and let their native decent impulses expand to fill the pattern they were meant to fill.

THERE are both good and bad reputations. A bad reputation to have is one that is so good that you are afraid to lose it for another. It is a bad thing for a man to have a reputation which is like a plaster cast which he dare not break, and from which he cannot escape. Many men are trying to live within the repute they won 20 years ago, afraid to "lose a reputation" which probably fitted them then but which is a misfit now. No man ever "loses his reputation"; he simply gets another one. It ought to be a better one. In any case, Reputation is only the projection on the public imagination of a picture which may be true or false. The real likeness is found in Character.

Profiteering? No! Profit? Yes! in 20c Cotton

Twenty Cents for Cotton Pleases Planters in Face of South's Demand for Forty Cents a Pound

In the face of the demand by the American Cotton Association for a price of at least 40 cents a pound for all the cotton produced in the South this year, and disregarding the threat of this association, backed by southern bankers, to reduce cotton acreage for 1921 fifty per cent under the 1920 planting, a co-operative foreign trading corporation is shipping cotton to Europe at 20 cents a pound.

The members of this corporation declare they are realizing a good profit at one-half the price demanded by the American Cotton Association. The corporation represents 200,000 acres of cotton in Mississippi, Arkansas and Tennessee. It has shipped about 20,000 bales to the mills of Germany and Czecho-Slovakia; has signed contracts to deliver 100,000 bales more, and has a total sale of 500,000 bales in sight for 1921.

This is the first co-operative foreign trading association, or corporation, to be put into successful operation in the United States since the war. It proves that cotton can be produced—even under the high costs of 1919-20—to sell at 20 cents a pound, and it reveals the profiteering in the demand for 40 cents for this same cotton. Here is the story, and it is a revelation to the cotton consumers of the world.

By HARRY H. DUNN

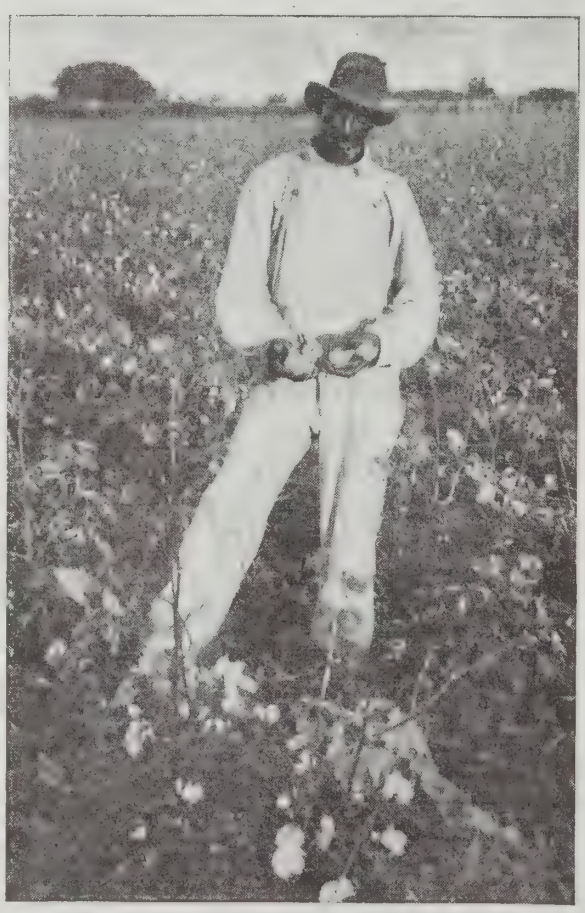
WHILE the American Cotton Association, and the various branches of this organization in the cotton producing states, were arranging for a reduction of at least 50 per cent in cotton acreage to be planted in 1921, and while the bankers of the cotton belt were uniting in the support of the demand of the American Cotton Association for a minimum price of 40 cents a pound for cotton, planters of three states in the South, representing more than 200,000 acres of cotton, quietly banded together in the first co-operative foreign trading corporation to be formed in the United States since the war, and proceeded to sell their cotton at 20 cents a pound in Europe.

These planters declare they take a good profit at 20 cents a pound. The American Cotton Association declares cotton cannot be produced this year at less cost than 25 cents a pound, and that the planter cannot maintain himself on cotton for which he receives less than 40 cents a pound. Apparently there is a vast discrepancy somewhere, a difference of 20 cents a pound, amounting to *one hundred dollars per bale,* which the consumer must pay, before the American Cotton Association will release to him the staple controlled by its members. Yet the Mississippi Delta Cotton Export and Trading Company—which is the name of the new corporation—has shipped nearly 20,000 bales of cotton to the mills of Germany and Czecho-Slovakia; has contracts with the mills of the latter country alone for 100,000 bales more, to be delivered during 1921, and has reliable prospects for the production and sale of 500,000 bales during the coming season.

These cotton planters, whose lands lie in Mississippi, Arkansas and Tennessee, whose headquarters is at Clarksdale, Mississippi, and who are shipping through Gulfport, Mississippi, to evade the excessive Public Belt Railroad and Public Cotton Warehouse charges at New Orleans, have agreed that the war is over and that it is time for war-time prices to get back to normal. They have refused to join in the campaign of the American Cotton Association, either to reduce production or to maintain war-time prices. Refused loans on their 200,000-acre crop by the Federal Reserve Board, they perfected this most advanced example of direct trading between the United States and Central Europe, and have progressed further with it than have either of the two large foreign finance corporations recently organized, one in New York and one in New Orleans, to provide financial sinews for similar projects.

The Mississippi Delta Cotton Export and Trading Company, which is generally known as the Delta Company, is handling the cotton of its original members and of all other planters of the three states named who care to come into it, on the following plan, newly devised and different from the methods of any previous project to dispose of the cotton crop of the South:

Cotton taken from the fields is classified, sampled and compressed; then shipped direct, without the intervention of middleman, forwarding agent, broker or jobber, to the mills of Germany, Czecho-Slovakia and the Balkan States.



These buyers (the mills) advance no money, and no price is fixed for the cotton. Freight, insurance and other charges for handling, are advanced by the shippers through the Delta Company.

The mills manufacture the cotton into whatever sort of goods seems to be in greatest demand, and take one-third of the manufactured goods as compensation for manufacture and for their profit. The remaining two-thirds is held by the European companies for orders of the Delta Company.

The Delta Company, which is to say, the producers of the cotton in Arkansas, Mississippi and Tennessee, then finds a market for its share of the manufactured goods, ships it to this market from the mills, collects for it and pays the planters.

Not only has this Delta Company thus saved the cotton crop of hundreds of southern planters, enabling them to continue producing cotton for the use of the world at virtually pre-war prices, but it has rescued from stagnation and failure more than a score of European mills, thrown into idleness because of inability to pay the high price demanded for other American cotton, and because of the necessity of having cash to pay for cotton from other sources. By the method of sale under discussion, not only is the price demanded by the American Cotton Association cut squarely in half, but the mills are enabled to handle the cotton without any outlay of cash, receiving their pay when the manufactured goods are sold. Officials of the Delta Company declare that if the price of American cotton were reduced to a normal level of 20 cents a pound, the mills of Central Europe would absorb 10,000,000 bales, these mills would be able rapidly to get back on their feet, work would be provided for hundreds of thousands of mill laborers, and these countries would be helped back to their financial, industrial and commercial feet more rapidly than by the outright advancement of funds by the bankers or government of the United States.

The planters who are in the Delta Company declare that this cotton has cost them approximately 15 cents a pound, maximum, much of it having cost around 12 cents. They consider 20 cents a pound more than a fair profit, and believe that when the new corporation is working to capacity, their cotton can be sold as low as 18 cents a pound, at a good profit. At present, six months is required for the planter to receive his payment after shipment of his cotton. This six months, however, has been offset by the issuance, by the Delta Company, of negotiable receipts for every bale of cotton handled. These receipts are accepted by all the banks of the three states named, at face value for the advancement of funds at nominal rates of interest.

He has been saved from bankruptcy and the probable loss of his farm by the first co-operative foreign-trade agency to be established and put into operation in the United States.

Bankers of Mississippi consider them better security than warehouse receipts from New Orleans or other ports along the Gulf of Mexico coast. The trading company is capitalized at $500,000, paid in by the planters, bankers and business houses of the section in which it operates, with which it is paying first operating expenses and facilitating loans to the smaller planters, on the security of their cotton receipts.

By this means of disposing of their cotton, also, the planters in the company are enabled to sell the lower grades, usually slow moving on the market. Any cotton grading from low middling to ordinary is accepted by these mills. This is operating rapidly to cause the distribution and manufacture of a large quantity of lower-grade cotton listed in government reports as "carry-over" cotton. Reports of large quantities of this class of cotton tend to depress the market for the higher grades, by showing the existence of a large volume of the staple whose fiber is of too low a grade to be in demand by American and British mills, but which is being manufactured profitably on a good market by the mills of Central Europe.

Explaining its method of operation, and the results attained, the Mississippi Delta Cotton Export and Trading Company issued a circular to the planters of the South, immediately following its first shipment of 10,000 bales to Europe on December 10, in which appears the following official statement:

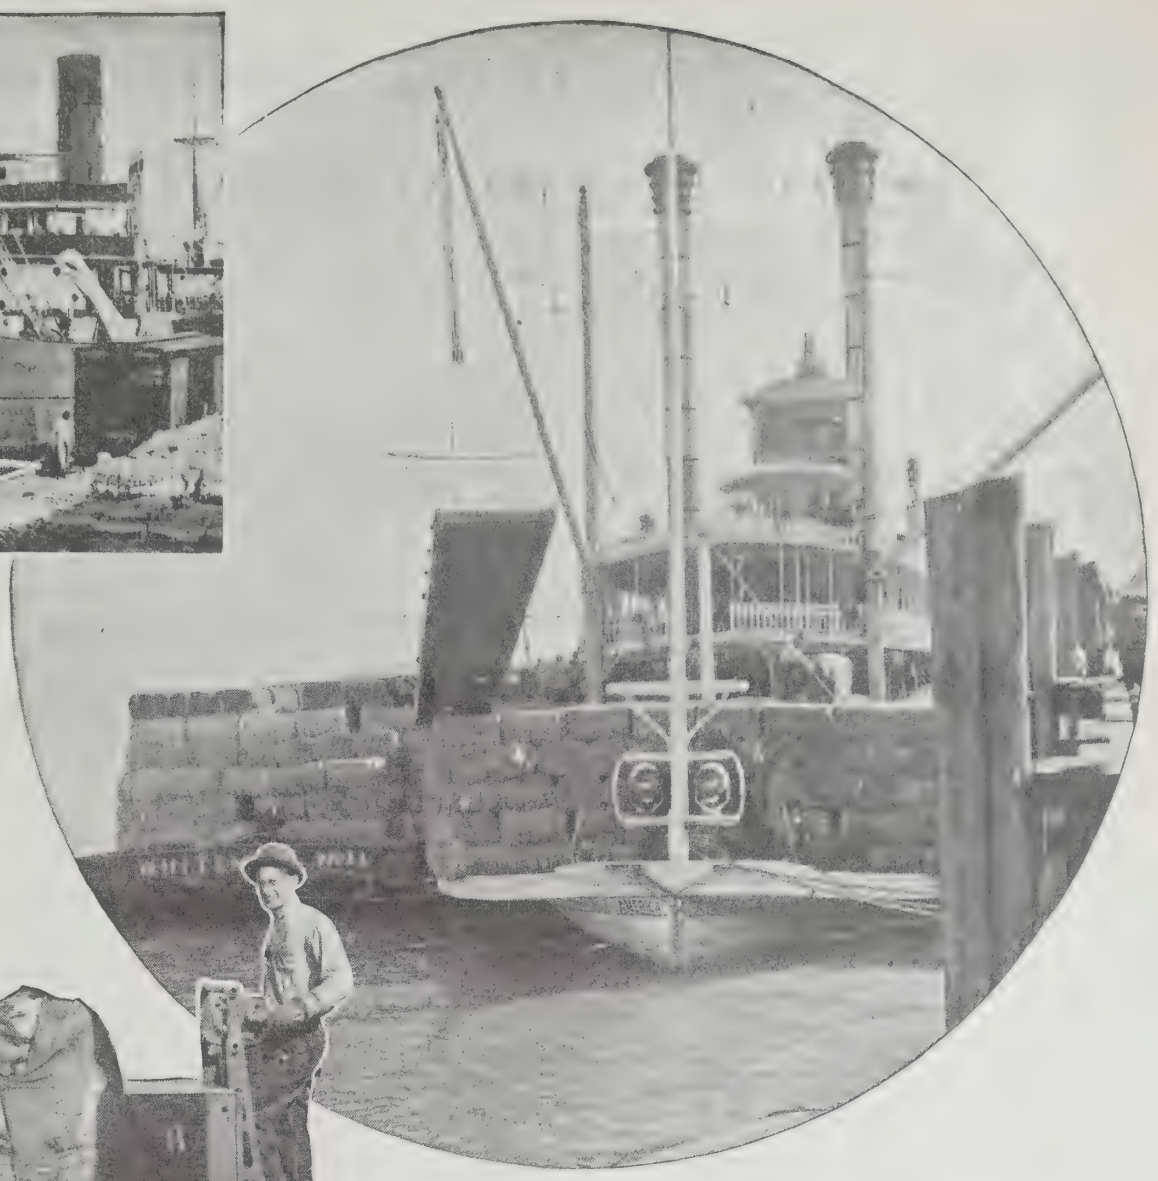
"Our cotton experts are in London conferring with representatives of 54 Central European milling companies, apportioning our entire production, and styling out the mills. They carried samples of all our grades of cotton as well as all colors now produced in the South. Any cotton can be used in grades between low middling and ordinary, inclusive, and in staple anything above and including Liverpool one and one-sixteenth inches. Colors are allowable. All cotton of different grades and staples than these can be used on other orders, but for the present the grades and staples mentioned are under contract.

"All cotton shipped remains the property of the shipper, or the assignee of his receipt, throughout shipment and manufacture. A separate trust receipt, acceptable to all banks and to the banking departments of the various states, is given for each bale. This receipt is negotiable. The banking department of Mississippi and many banks of Arkansas and Tennessee, and the large banking correspondents in New York of these southern banks, have signified their willingness to accept, within reasonable limitations, these trust receipts, in place of warehouse receipts now pledged for loans.

"Final settlement in money may be expected by shippers within six months of date of shipment. The company will not guarantee actual prices or net returns, but pledges itself to use its utmost endeavors, the best and most efficient agencies, and that no contracts will be entered into which will not, in the opinion of the company, pay the shipper approximately 20 cents a pound for the cotton shipped. Goods will be sold, if possible, while the raw cotton is in process of shipment. It is estimated that we can undersell the present American and English markets for manufactured cotton goods at least 20 per cent and still realize the above estimate of profit.

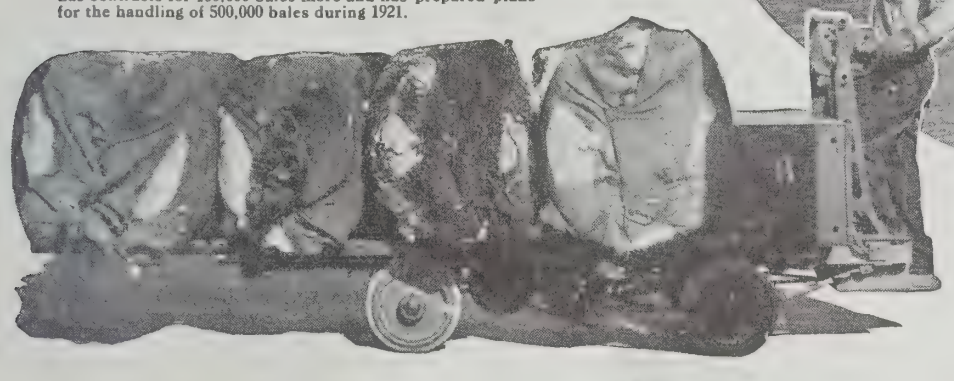
"The organization of the Delta Company promises not only to dispose of a large part of the cotton crop of the South at pre-war, but profitable, prices; to rescue a number of European mills from stagnation; to provide a large part of the world's supply of manufactured cotton at lower costs to the consumer, and to establish permanent business relations ultimately amounting to millions of dollars annually, between the lower Mississippi Valley and the cotton spinners of Southeastern Europe."

There is no prejudice as to market on the part of this co-operative corporation. If the spinners of America and England wish to buy cotton on the basis already established, the corporation is willing to sell to them provided these mills will handle all grades, as the Central European mills are doing. The cotton planter of the delta region believes it has brought him freedom from the exactions of the coterie of New England and English spinners who have controlled the market for a number of years, while the Central European spinners are getting cotton at a lower figure, on easier terms, and more abundantly than they ever have been able to get it, even before the war.



The banks and other financial institutions of New Orleans, being tied up with the American Cotton Association in the effort to raise prices and reduce acreage, have taken no part in assisting the Delta Company, so that all its shipments have been made through Gulfport, Mississippi. Rates for handling cotton at New Orleans are higher than they are at any other port in the world. The Public Belt Railroad charges 23 cents a bale, which is more than the entire terminal charge at Galveston or Gulfport. The Public Cotton Warehouse and Compress at New Orleans charges 70 cents a bale for handling, as compared with 35 cents in private warehouses at other ports. These figures have combined to reduce the 1920 cotton-handling business of New Orleans 14 per cent under that of 1919, while Galveston is handling 100 per cent more cotton; Mobile, 38 per cent more; Texas City, nearly 200 per cent more, and Savannah, Georgia, more than 40 per cent more. the last-named, a comparatively small port, now handling as much cotton as New Orleans.

Headquarters of the Delta Company is at Clarksdale, Mississippi, in the heart of what is commonly known as the Mississippi delta country. The officials are all cotton planters, bankers and men interested in the cotton industry. Gerald Fitzgerald, president of the Clarksdale Cotton Sales Company, is president of the co-operative corporation; M. P. Sturdivant, cotton planter of Glendora, Mississippi, is vice president; J. O. Lamkin, president of the Commercial Bank of Clarksdale, is treasurer, and Everette J. Mullen, is secretary. Agencies have been established in the mill cities of Continental Europe, and men familiar with cotton in all its forms sent to handle the business of the co-operative company there. No salaries are paid to any of the officials, all of whom must be stockholders,



Ocean freighter loading cotton at Louisiana port. The cotton is sold for twenty cents and a legitimate profit derived from its planting, raising and sale.

Shipping Cotton to Europe at 20 Cents a Pound

Electric motor truck for interior handling of cotton at New Orleans. All these expenses are obviated by the new co-operative foreign trading association, which has shipped nearly 20,000 bales of cotton to the mills of Central Europe, has contracts for 100,000 bales more and has prepared plans for the handling of 500,000 bales during 1921.

Bringing cotton down the river by packet and barge from the Mississippi plantations for shipment to the mills of Czecho-Slovakia, which have contracted for 100,000 bales with the new Mississippi Delta Cotton Export and Trading Company.

and the agents in Europe, who receive salaries, must also hold certain amounts of stock in the company, so as to insure continued interest in its successful operations.

In contrast to this method of disposing of the cotton crop at pre-war prices, the Louisiana Bankers Association, in official session at New Orleans early in January, unanimously agreed to stand back of the Memphis Plan of the American Cotton Association to reduce cotton acreage one-half for the next crop, so as to force prices to levels of approximately 40 cents a pound, by "allowing" the American farmer to plant only one-third of his cultivated land in cotton. The state of Louisiana was organized for this movement on the basis of congressional districts, and it was openly announced that "the big stick" would be used by all the banks on every planter, large or small, who did not at once conform to the orders for reduced acreage. Texas reports indicate that acreage there will be reduced from one-third to one-half, and that similar tactics will be adopted to club the planters into line to force the spinners to pay 40 cents for cotton, or more, and the consumer to pay as much more as the spinner may have to ask to maintain his industry.

Dr. Hillis and the Jews

In the world famous Plymouth Church, Brooklyn, New York, where for forty years Henry Ward Beecher preached, a sermon touching the Jewish Question was delivered last autumn by Newell Dwight Hillis, the minister. All that the public at large knows about it was gathered from the protests of Jewish rabbis in New York. The newspapers printed the protests, but did not print Dr. Hillis' remarks. However, on Sunday morning, January 16, Dr. Hillis touched upon the matter again. This sermon was printed in full by the Brooklyn Daily Eagle, from which paper the following extracts are made. Dr. Hillis' strong Americanism and Christian breadth of mind, as well as the mellow charity of his judgment, appear to strong advantage here.

THERE cannot be, there must not be, any hatred between any Jew and any Gentile. Of late, during these dark days, oft at midnight, I find myself wondering why my noble Hebrew friends—why Rabbi Wise, with his gifted intellect, and Rabbi Silverman, with his solid learning and his massive character—why this multitude of Hebrew scholars and patriots and devoted lovers of their fellow men have not claimed the Nazarene as the tallest flower that grew in their Hebrew garden, as the mightiest tree that ever unfolded its boughs and branches in God's divine Eden, and as the supreme voice that rings through all the synagogues, calling men not only to law but to love and mercy. Jesus brought the world a new thought of God, freedom, love and immortality. Those who should first have lifted the trumpets upon their lips were Jewish musicians, those first to wave the triumphal banners should have been Jewish people; those who lighted the flames of the sacred fires should have been the hands of Hebrews. The pierced hands of the Nazarene prophet never made a wound, though He healed many; never extinguished a torch, though He kindled many a light to shine into the dark night; never plucked hope out of a human heart, though He planted many an aspiration. And the first people on earth to walk in His triumphal procession should have been the noble Hebrews, walking in the vanguard, while the rest of us followed as captives in His triumphal procession up the hills of time. Soon or late the mists will pass, the clouds will dissolve.

Twice within last year I urged the duty of every Hebrew, who was faithful to the faith of Jehovah, to repudiate the wicked Protocols as the work either of an enemy, or if a man of Hebrew origin, who, as an apostate, betrayed the faith of his fathers; strangely enough, I received much criticism therefor. But no man's hatred of me can evoke any hatred in my heart in return. Many mistakes have been made on both sides during the last thousand years; many crimes have been committed . . . . Soon or late love will be victorious over hate, liberty will conquer oppression, God will arise and by mercy subdue all His enemies. And first among His followers in that great day of this immortal hope shall be Paul, the brilliant Hebrew rabbi, the noblest hero and the whitest saint of all the centuries!

But there is a faith of the fathers, a faith of the republic, and its free institutions. Each week brings many revelations of men who have betrayed the faith of the founders of our Republic.

Last week I went to Western Pennsylvania, to pass from place to place to find out what one could, about the burning of four million dollars' worth of buildings—schoolhouses, churches, homes, stores and farmers' granaries. Not until the investigation is complete, and all the facts are in, can any one speak with certainty, beyond the general statement that there is plainly a secret organization whose members believe, as Bolsheviks, that everything must be burned to the ground, and then built up again by believers in the Soviet form of government. Anarchists? Yes. Nihilists? Yes. Bolsheviks? Yes. But, essentially, men who live to the hand and the stomach, men who no longer believe in any God, or future life, or responsibility for the deeds done in the body. But how could it be otherwise? Look at these foreigners, after a week at Ellis Island. Has any commissioner ever been more faithful, patriotic, or far-sighted than Commissioner Wallis? Mark the revolution in the physical conditions of the island, with buildings kept spotlessly clean, playgrounds for children, a nursery for the little ones, and cleanly wards for the sick.

But scarcely have these immigrants left Ellis Island than they receive in various languages the poison of anarchy and revolution which is instilled into the mind and heart. We have a daily paper in New York published in English, and also in German. The sentiments in English represent vague anti-Americanism, and the sentiments in the foreign language represent treason to this Republic. Scarcely have these foreigners landed at the railroad stations, than they receive a card published in six languages containing essentially these statements: "Immigrants, remember that this is a capitalistic government. Remember it is a dirty and a rotten government, where the capitalist will exploit your life. The only way you can get a job is to join a radical society or union. Join some revolutionary society, and help us overthrow this wicked, capitalistic government."

Now what men sow they reap. Sow wheat, you reap sheaves. Sow thistles, you reap thistles. Sow sparks, you reap conflagrations. Sow hatred of this Republic, you reap revolution.

There is one race in this country that commits ten crimes to every one crime committed by the native American per thousand citizens.

There is another foreign people, new in this country, that commits eight crimes where a native American commits one.

This Republic cannot exist, half American and half alien. Either Americanism must expel anti-Americanism, or the anti-American sentiment will Bolshevize our people and destroy our Republic. Soon for all parents and patriots and teachers, the end shall come, just as Paul knew that his execution was set for the following day. In reviewing his life, he exclaimed, as he anticipated meeting Jesus, "I have kept your faith!"

Have you kept the faith of the American school? Have you flattered men to win their votes, and debauched the voters of your city? Has your service been venial, selfish? Have you lowered the ideals of patriotism? Have you been what is called a practical politician? Have you helped elect men as judges, using money, because later on they could be influenced to give an occasional decision worth much money to those who paid their election bills? Have you betrayed the Church, the Sunday and the family itself? Many of you are in the afternoon of life's day, already the shadows are falling low; soon the end will come. Be wise while it is yet time. Give yourselves in loyalty to the great convictions. When the end comes, and you go, on that revealing day, into the great company of immortals, see to it, that in that hour when all noble ancestors, and all heroic souls, are turned toward you, that you are able to lift your hand and say without fear, "I have kept the faith of my country, I have kept the faith of my friends, I have kept the faith of God, and His dear Son, the Saviour of the world."

When Editors Were Independent of the Jews

How Bennett, of the Herald, Said "No" to New York Jewry, and Made It Stick. A Chapter From American Newspaper History

THE first instinctive answer which the Jew makes to any criticism of his race coming from a non-Jew is that of violence, threatened or inflicted. This statement will be confirmed by hundreds of thousands of citizens of the United States who have heard the evidence with their own ears. Of recent months the country has been full of threats against persons who have taken cognizance of the Jewish Question, threats which have been spoken, whispered, written and passed as resolutions by Jewish organizations.

If the candid investigator of the Jewish Question happens to be in business, then "boycott" is the first "answer" of which the Jews seem to think. Whether it be a newspaper, as in the case of the old New York *Herald;* or a mercantile establishment, as in the case of A. T. Stewart's famous store; or a hotel, as in the case of the old Grand Union Hotel at Saratoga; or a dramatic production, as in the case of 'The Merchant of Venice"; or any manufactured article whose maker has adopted the policy that "my goods are for sale, but not my principles"—if there is any manner of business connection with the student of the Jewish Question, the first "answer" is "boycott."

The technique is this: a "whispering drive" is first begun. Disquieting rumors begin to fly thick and fast. "Watch us get him," is the word that is passed along. Jews in charge of ticker news services adopt the slogan of "a rumor a day." Jews in charge of local newspapers adopt the policy of "a slurring headline a day." Jews in charge of the newsboys on the streets (all the street corners and desirable places downtown are preempted by Jewish "padrones" who permit only their own boys to sell) give orders to emphasize certain news in their street cries—"a new yell against him every day." The whole campaign against the critic of Jewry, whoever he may be, is keyed to the threat, "Watch us get him."

An Attack Made From Ambush

JUST as Mr. Gompers and Justice Brandeis believe in "the secondary strike," as a recent Supreme Court decision reveals, so the Jews who set out to punish the students of the Jewish Question believe in a secondary boycott. Not only do they pledge themselves (they deny this, but the newspaper reports assert it, as do unpublished telegraphic dispatches to some of the newspapers) not to use the specific product in question, but they pledge themselves to boycott anyone else who uses it. If the article is a hat (it is unlikely to be a hat, however, hats being largely Jewish) not only do the Jews pledge themselves to refrain from buying that kind of hat, but also to refrain from doing business with anyone who wears such a hat.

And then, when anything seems to occur at the hat works which indicates slackness, the Jews, forgetting all about their denial of a pledged boycott, begin to boast—"See what we did to him?"

The "whispering drive," the "boycott," these are the chief Jewish answers. They constitute the bone and sinew of that state of mind in non-Jews which is known as "the fear of the Jews."

They do not always notify their victim. Recently the young sales manager of a large wholesale firm spoke at a dinner whose guests were mostly the firm's customers. He is one of those young men who have caught the vision of a new honor in business. He believes that the right thing is always practicable, and, other things being equal, profitable as well. Among the guests were probably 40 Jewish merchants, all customers of the firm. In his address the young sales agent expressed his enthusiasm for morality by saying, "What we need in business is more of the principles of Jesus Christ." Now, as a matter of fact, the young man knows very little about Jesus Christ. He has caught fire from the Roger Babson idea of religious principle as a basis of business, but he expressed it in his own way, and everybody knew what he meant; he meant decency, not sectarianism. Yet, because he used the expression he did, he lost 40 Jewish customers for his firm, and he doesn't yet know the reason why. The agents of the firm which got the new trade know the reason. It was a silent, unannounced boycott.

This article is the story of a boycott which lasted over a number of years. It is only one of numerous stories of the same kind which can be told of New York. It concerns the New York *Herald,* one newspaper that dared to remain independent of Jewish influence in the metropolis.

The *Herald* enjoyed an existence of 90 years, which was terminated about a year ago by an amalgamation. It performed great feats in the world of news-gathering. It sent Henry M. Stanley to Africa to find Livingstone. It backed up the Jeannette expedition to the Arctic regions. It was largely instrumental in having the first Atlantic cables laid. But perhaps its greatest feat was the maintenance during many years of its journalistic independence against the combined attack of New York Jewry. Its reputation among newspapermen was that neither its news nor its editorial columns could be bought or influenced.

Its proprietor, the late James Gordon Bennett, had always maintained a friendly attitude toward the Jews of his city. He apparently harbored no prejudice against them. Certainly he never deliberately antagonized them. But he was resolved upon preserving the honor of independent journalism. He never bent to the policy that the advertisers had something to say about the editorial policy of the paper, either as to influencing it for publication or suppression.

Suppressing Facts About the Jews

THIRTY years ago the New York press was free. Today it is practically all Jewish controlled. This control is variously exercised, sometimes resting only on the owners' sense of expediency. But the control is there and, for the moment, it is absolute. One does not have to go far to be able to find the controlling factor in any case. Newspapermen do not glory in the fact, however; it is a condition, not a crusade, that confronts them, and for the moment "business is business."

Thirty years ago there were also more newspapers in New York than there are today. There were eight or nine morning newspapers; there are only five today. The *Herald,* a three cent newspaper, enjoyed the highest prestige, and was the most desirable advertising medium due to the class of its circulation. It easily led the journalistic field.

At that time the Jewish population of New York was less than one-third of what it is today, but there was much wealth represented in it.

Now, what every newspaperman knows is this: most Jewish leaders are always interested either in getting a story published or getting it suppressed. There is no class of people who read the public press so carefully, with an eye to their own affairs, as do the Jews; and many an editor can vouch for that.

The *Herald* simply adopted the policy from the beginning of this form of harassment that it was not to be permitted to sway the *Herald* from its duty as a public informant. And that this had a reflex advantage for the other newspapers is apparent from the following statement:

If a scandal occurred in Jewish circles, influential Jews would swarm into the editorial offices to arrange for a suppression of the story. But the editors knew that not far away was the *Herald* which would not suppress for anything or anybody. What was the use of one paper suppressing, if another would not? So the editors would say, "We would be very glad to suppress this story, but the *Herald* is going to use it, so we'll have to do the same in self-protection. However, if you can get the *Herald* to suppress it, we will gladly do so too."

A Jewish Mayor for New York

BUT the *Herald* never succumbed. Neither pressure of influence nor promises of business nor threats of loss availed: it printed the news.

There was a certain Jewish banker who periodically demanded that Bennett discharge the *Herald's* financial editor. This banker was in the business of disposing of Mexican bonds at a time when such bonds were least secure. Once when an unusually large number of bonds were to be unloaded on unsuspecting Americans, the *Herald* published the story of an impending Mexican revolution, which presently ensued. The banker frothed at the mouth and moved every influence he could to change the *Herald's* financial staff, but was not able to effect the change even of an office boy.

Once when a shocking scandal involved a member of a prominent family, Bennett refused to suppress it, arguing that if the episode had occurred in a family of any other race it would be published regardless of the prominence of the figures involved. The Jews of Philadelphia secured suppression there, but because of Bennett's unflinching stand there was no suppression in New York.

A newspaper is a business proposition. There are some matters it cannot touch without putting itself in peril of becoming a defunct concern. This is especially true since newspapers no longer receive their support from the public but from the advertisers. The money the reader gives for the paper scarcely suffices to pay for the amount of white paper he receives. In this way, advertisers cannot be disregarded any more than the paper mills can be. And as the most extensive advertisers are the department stores, and as most department stores are owned by Jews, it comes logically that Jews often try to influence the news policies at least, of the papers with whom they deal.

In New York it has always been the burning ambition of the Jews to elect a Jewish mayor. They selected a time when the leading parties were disrupted, to push forward their choice. The method which they adopted was characteristic.

They reasoned that the newspapers would not dare refuse the dictum of the combined department store owners, so they drew up a "strictly confidential" letter which they sent to the owners of the New York newspapers, demanding support for the Jewish mayorality candidate.

The newspaper owners were in a quandary. For several days they debated how to act. All remained silent. The editors of the *Herald* cabled the news to Bennett who was abroad. Then it was that Bennett exhibited that boldness and directness of judgment which characterized him. He cabled back, *"Print the letter."* It was printed in the *Herald's* editorial columns, the arrogance of the Jewish advertisers was exposed, and non-Jewish New York breathed easier and applauded the action.

The *Herald* explained frankly that it could not support a candidate of private interests, because it was devoted to the interests of the public. But the Jewish leaders vowed vengeance against the *Herald* and against the man who dared expose their game. They had not liked Bennett for a long time, anyway. The *Herald* was the real "society newspaper" in New York, but Bennett had a rule that only the names of really prominent families should be printed. The stories of the efforts of newly rich Jews to break into the *Herald's* society columns are some of the best that are told by old newspapermen. But Bennett was obdurate. His policy stood.

Bennett, however, was shrewd enough not to invite open conflict with the Jews. He felt no prejudice against the race; he simply resented their efforts to intimidate him.

A $600,000 Advertising Boycott

THE whole matter culminated in a contention which began between Bennett and Nathan Straus, a German Jew whose business house is known under the name of "R. H. Macy & Company," Macy being the Scotchman who built up the business and from whose heirs Straus obtained it. Mr. Straus was something of a philanthropist in the ghetto, but the story goes that Bennett's failure to proclaim him as a philanthropist led to ill feeling between the two. A long newspaper war ensued, the subject of which was the value of the pasteurization of milk—a stupid discussion which no one took seriously, save Bennett and Straus.

The Jews, of course, took Mr. Straus' side. Jewish speakers made the welkin ring with laudation of Nathan Straus and maledictions upon James Gordon Bennett. Bennett was pictured in the most vile business of "persecuting" a noble Jew. It went so far that the Jews were able to put resolutions through the board of aldermen.

Long since, of course, Straus, a very heavy advertiser, had withdrawn every dollar's worth of his business from the *Herald* and the *Evening Telegram.* And now the combined and powerful elements of New York Jewry gathered together to deal a staggering blow at Bennett—as years before they had dealt a blow to another citizen of New York. The Jewish policy of "Dominate or Destroy" was at stake, and Jewry declared war.

As one man, the Jewish advertisers withdrew their advertisements from Mr. Bennett's newspapers. Their assigned reason was that the *Herald* was showing animosity against the Jews. The real purpose of their action was to crush an American newspaper owner who dared be independent of them.

The blow they delivered was a staggering one. It meant the loss of $600,000 a year. Any other newspaper in New York would have been put out of business by it. The Jews knew that and sat back, waiting the downfall of the man they chose to consider their enemy.

But Bennett was ever a fighter. Besides, he knew Jewish psychology probably better than any other non-Jew in New York. He turned the tables on his opponents in a startling and unexpected fashion. The coveted positions in his papers had always been used by the Jews. These he immediately turned over to non-Jewish merchants under exclusive contracts. Merchants who had formerly been crowded into the back pages and obscure corners by the more opulent Jewish advertisers, now blossomed forth full page in the most

popular spaces. One of the non-Jewish merchants who took advantage of the new situation was John Wanamaker, whose large advertisements from that time forward were conspicuous in the Bennett newspapers.

The Bennett papers came out with undiminished circulation and full advertising pages. The well-planned catastrophe did not occur. Instead, there was a rather comical surprise. Here were the non-Jewish merchants of New York enjoying the choicest service of a valuable advertising medium, while the Jewish merchants were unrepresented. Besides, the "punishment" which the Jews had administered showed no signs of inflicting inconvenience, let alone pain. The "boycott" had been hardest on the boycotters.

Unable to stand the spectacle of trade being diverted to non-Jewish merchants, the Jews dropped their hostile attitude and came back to Bennett, requesting the use of his columns for advertising. Bennett received all who came, displaying no rancor. They wanted back their old positions, but Bennett said, No. They argued, but Bennett said, No. They offered money, but Bennett said, No. The choice positions had been forfeited.

The Growth of the Jewish Press

THEN a curious circumstance transpired. A few Jews whose business sense had overcome their racial passions had continued to advertise in the *Herald* all through the "boycott." When they saw their rebellious brethren coming back and taking what positions they could get in the advertising pages, they suspected that Bennett had lured them back by offering a lower rate. So they wrote to Bennett, demanding to know the circumstances, and as usual Bennett published the letter and replied that his rates had not been lowered.

Bennett had triumphed, but it proved a costly victory. The Jews persistently followed the plan which they had inaugurated as early as 1877 for the ruin of another New Yorker who had refused to bow before them. All the time Bennett was fighting them, the Jews were gradually growing more powerful in New York. They were growing more powerful in journalism every year. They were obsessed by the fatuous idea that to control journalism in New York meant to control the thought of the country. They regarded New York as the metropolis of the United States, whereas all balanced minds regard it as a disease.

The number of newspapers gradually diminished through combinations of publications. Adolph S. Ochs, a Philadelphia Jew, acquired the *Times*. He soon made it into a great newspaper, but one whose bias is to serve the Jews. A tabulation of the Jewish publicity that finds its way into the *Times* reveals interesting figures. Of course, it is the quality of the *Times* as a newspaper that makes it so weighty as a Jewish organ. In this paper the Jews are persistently lauded and eulogized and defended. No such tenderness is granted other races. It is quite possible that the staff of the *Times* will not regard this as entirely true. Personally and individually, the majority of them are "not that kind of people." But there is the *Times* itself as evidence.

And then Hearst came into the field—a dangerous agitator because he not only agitates the wrong things, but because he agitates the wrong class of people. He surrounded himself with a coterie of Jews, pandered to them, worked hand in glove with them, even fell out with them, but never told the truth about them—"never gave them away." Naturally, he received large advertising patronage. The trend toward the Jewish-controlled press set in strongly, and has continued that way ever since. The old names, made great by great editors and American policies, slowly dimmed.

A newspaper is founded either on a great editorial mind, in which event it becomes the expression of a powerful personality, or it becomes institutionalized as to policy and becomes a commercial establishment. In the latter event, its chances for a continuing life beyond the lifetime of its founder are much stronger. The *Herald* was Bennett, and with his passing it was inevitable that a certain force and virtue should depart out of it.

Bennett, advancing in age, dreaded lest his newspaper, on his death, should fall into the hands of the Jews. He knew that they regarded it with longing eyes. He knew that they had pulled down, seized, and afterward built up many an agency that had dared speak the truth about them, and boasted about it as a conquest for Jewry, a vindication of the oft misquoted prophecy, "He that curses you I will curse." Bennett loved the *Herald* as a man loves his child. He so arranged his will that the *Herald* should never fall into individual ownership. He devised that its revenues should flow into a fund for the benefit of the men who had worked to make the *Herald* what it was. He died in May, 1918.

The Jewish enemies of the *Herald*, eagerly watchful, more and more withdrew their advertising to force, if possible, the sale of the paper. They knew that if the *Herald* became a losing proposition, the trustees would have no course but to sell, notwithstanding Mr. Bennett's will.

A Gallant Paper's Memory

BUT there were also strong moneyed interests in New York who were beginning to realize the peril of a Jewish press. These interests provided a large sum for the *Herald's* purchase by Frank A. Munsey. Then, to the general astonishment, Mr. Munsey discontinued the gallant old sheet, and bestowed its name as part of the name of the New York *Sun*. But the actual newspaper managed by Bennett is extinct. Even the men who worked upon it are scattered abroad in the newspaper field.

Even though the Jews had not gained possession of the coveted *Herald* they had at least succeeded in driving another non-Jewish newspaper from the field. They set about obtaining control of several evening newspapers, which action is now complete.

But the victory was a financial victory over a dead man. The moral victory, as well as the financial victory, remained with Bennett as long as he lived; the moral victory still remains with the *Herald*. The *Herald* is immortalized as the last bulwark against Jewry in New York. Today the Jews are more completely masters of the journalistic field in New York than they are in any capital in Europe. Indeed, in every capital in Europe there is a newspaper that gives the real news of the Jews. There is none in New York. And thus the situation will remain until Americans shake themselves from their long sleep, and look with steady eyes at the national situation. That look will be enough to show them all, and their very eyes will quail the oriental usurpers.

The moral is: whatever comes out of New York now must be doubly scrutinized, because it comes from the center of that Jewish government which desires to guide and color the thoughts of the people of the United States.

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

Non-Jews Held Up

Unless a man admires the Jews, he cannot be admitted to the United States. That is, if he does not admire the Jews, the authorities will not permit him to pass Ellis Island. This was the experience of Major General Count Cherent T. Spirodovitch. It seems unbelievable, but it is true, and *the attention of the State Department of the Government of the United States is hereby respectfully called to the matter.* The New York *Tribune* of December 14, reports the case, which has been confirmed—"After he had satisfied a board of special inquiry that he had not come to this country to conduct propaganda against the Jews," Count Spirodovitch was released from Ellis Island. "He was forbidden the privilege of landing until he could appear before a board at Ellis Island, it being believed that he had come to the United States with a view to issuing propaganda against the Jews." What if he had? Those who come to issue propaganda against the English and the French and the Bolsheviks are admitted. Since when has the United States had authority from the people to bar non-admirers of the Jews from this country?

Millions for Relief?

The American Jewish Relief Committee, since its organization in 1914, has expended more than $33,000,000 for the relief of Jewish war sufferers in Eastern Europe and other parts of the world and further appropriations of from $500,000 to $1,000,000 monthly are being made by the joint distribution committee, of which Felix M. Warburg is chairman. More than half this big total was spent in Poland, Lithuania and Courland and about $4,000,000 each in Russia, Austria-Hungary and Palestine. In view of the fact that these millions pass through the hands of the same international Jewish bankers who financed Japan for the war on Czaristic Russia and the Bolshevist revolution, the question is asked in certain quarters: is *all* this money spent on feeding the hungry and clothing the naked? The Jews are crying out continually against the lending of American money to Poland to help her get on her feet and defend herself against the Bolshevist menace. The transfer of thirty-three millions of dollars of this nation's wealth to the centers of revolutionary unrest in Europe under the auspices of a single committee of a single race or nationality might well be checked up by Congress.

Did They Get Gibson Out?

The Polish press expresses deep regret over the news of the resignation of Hugh Gibson, the first American minister at Warsaw. It will be remembered that Mr. Gibson served as secretary of our legation in Brussels during the war period and later ably assisted the minister, Brand Whitlock, in his splendid work in behalf of the Belgian population. The *Przeglad Wieczorny*, of Warsaw, says that Mr. Gibson was always a staunch friend of Poland and bravely defended the nation against false stories of "pogroms" and persecution of the Jews. Was this the reason for his departure?

A Minister Makes Correction

Dr. E. E. Violette, a minister of Kansas City, recently preached a sermon in which he presented the Jewish propagandist point of view very clearly. The sermon, however, was not reported to his satisfaction, and he wrote to a Kansas newspaper as follows:

"On account of several letters and telephone calls regarding a report of my sermon of Sunday night, will you kindly for the sake of accuracy make a slight correction? I was reported to have said that Jenny Lind, Rubens and several other singers, artists, musicians and writers, were Jews. *What I did say was that many of these were financed by Jews.* I can understand how an error of this sort could be made because one who heard the sermon corrected me for saying that my handsome friend, Irvin S. Cobb, of old Paducah, 'was a Jew.' No, Irvin never 'was' a Jew and is not now. What I did say was this: *'Irvin Cobb was financed by Joe Freidman, a Jew, of Paducah, Kentucky.'"* The italics are ours.

Jews in Moscow

One of the largest theaters in Moscow has been renovated and rededicated as a special home for Jewish plays, Moscow now being "the center to which many talented young Jewish artists have been attracted," according to a Jewish News Service dispatch.

Count Witte and Jacob Schiff

In a recent installment of the memoirs of Count Witte, the Russian statesman, now appearing in the London *Daily Telegraph*, an incident is related that gives us a flash of light on the methods of certain Jewish financiers. It will be remembered that Jacob H. Schiff boasted that he had financed Japan in the war of that country with Russia to "get even" with the czar's government for Jewish "pogroms." This did not deter him from heading a delegation of prominent Jews who called on Count Witte at Portsmouth during the negotiation of the peace treaty there. The party also included Oscar S. Straus and one of the Seligmans. They said they came to discuss the hard lot of the Jews in Russia. The count suggested that if all anti-Jewish restrictions were removed at once the Jews would be more harmed than benefited. (This was the precise argument later put forward by President Taft.) At this, he relates, Mr. Schiff flew into a rage unlike Mr. Straus, who showed great self-possession. Witte cabled a report of the discussion to Petrograd . . . . A little later the count met J. P. Morgan who offered to assist him in order that the Russian statesman might not have to go to Schiff and his colleagues.

Offends Jews—Gets Out

The Rev. Dr. William Carter, a Presbyterian clergyman, of Brooklyn, New York, was on the list of lecturers of the Brooklyn board of education until in one of his lectures he dropped a remark that the Russian Bolshevik Jews were "the offscourings of Judaism." The complaint against him was made by a rabbi who had not heard the lecture. In the presence of the director of lectures, this rabbi used language toward the Presbyterian minister that was described as "malicious, malign and hateful." The director of lectures did not rebuke the rabbi, but suggested the minister's resignation. Of course, this was in the Judaized East! The director then wrote to his other lecturers that "in view of the highly sensitized condition of the Jews," the lecturers should use the soft pedal. This means silence or taffy. The Jews would soon construe silence as "persecution." So, after all, it means taffy. How far would a complaint of non-Jews have gone against Dr. Carter? When will the non-Jews stop being "simps"?

Jews Their Own Enemies

The Jew who bootlegs, puts a sword into the side of Jewish reputation. The Jew who does not pay his just and honorable debts, poisons Jewish credit. The Jew who gambles in public, puts a bullet into Jewish pride. The Jew who is loud and boisterous in public, puts a stiletto into Jewish self-respect. The Jew who abuses the privileges of insurance, puts disease into the vitals of Jewish honor. The Jew who practices sharp dealings, plunders Jewish prestige. The Jew . . . . whose approach to lawlessness puts him near the border of illegality or even criminality, grievously injures the good name, the honor, the reputation of Jewry as a whole. Surely, pernicious acts of Jews themselves, is a form of persecution as destructive in its way as the intolerance, bigotry and abuse of those who deliberately seek or wish our destruction.—*B'Nai B'Rith News.*

Brandeis Dissents

By a vote of six to three the Supreme Court of the United States, on December 30, decided that the "secondary boycott" was criminally illegal, being a conspiracy in restraint of trade. One of the dissenting votes was cast by Mr. Justice Holmes who is about to retire on account of old age and another by Mr. Justice Brandeis, Jew and Zionist leader, who in this matter shows himself entirely in agreement with his co-racialist, Samuel Gompers. Commenting on the decision, Rabbi Rudolph I. Coffee says in the Chicago *Jewish Sentinel*: "With Justice Holmes' retirement, Justice Brandeis will be the chief defender of liberal and progressive ideas on the supreme bench. The tendency of our day seems reactionary and set ag reforms. Justice Brandeis will be a tower of st upholding the recent legislative gains of the ne order, although just now the target of ma attacks."

The Fighting Kings of Ireland

IMPROBABLE but romantic is the suggestion that Ireland will choose a king: improbable because of the staunch republican ideals at the basis of the Sinn Fein movement; romantic because the kings of Ireland make up one of the grimmest and most fascinating chapters in history. Most of them died with their boots on. Most of them fell with the sword or club swinging. Some fell through treachery; but all were fighters.

The beginnings of Ireland—Erin, the Island of Destiny—are enveloped in fable. But as far away as 1000 Before Christ there is record of Eochy the First. Moreover Eochy ruled over a sort of civilization, for the records state "society was classified into seven grades, each marked by the number of colors in its dress, and that in this classification men of learning, that is, eminent scholars, were by law ranked next to royalty."

A little later came Ollav Fola, Ard-Ri (or high-king) of Erin. Ollav Fola had a parliament. The princes and chieftains constituted one house; the scholars, bards, law-givers, judges and historians another house; and the military commanders a third house. The monarch's characteristics can be read in his name; Ollav was the name given scholars.

But even then most cases were tried on the battlefield, which was the supreme court of appeal. Under the high-king were the monarchs of provinces, and under each of these smaller kings were the clans with a local chief. These fought frequently among themselves, but had a fatal knack of uniting when anyone from outside started something.

The tribe was formed of a number of families or clans, all descended, or supposed to be descended, from some common ancestor, and all bound together by the same customs. At the head of the tribe was the chief or petty king, elected by the people either for his strength, wealth or wisdom, or as the most suitable leader in times of war. The chief had certain of the tribe lands set apart for his own use, and he also exacted tributes in cattle and services from the people, and lent them cattle on hire. Next in importance to the chief came the landowning nobles, and below them were the freemen. Some of these owned property; those who did not were of lesser importance, yet had some share in the common lands of the tribe.

The lowest social grade was that of the slaves, who had no rights or property at all; these were generally men of subject races or had been taken captive in war. As there was no money, the wealth of the tribe was based upon the number of heads of cattle which it possessed, and sheep, pigs and cows were also used as a medium of exchange and in the payment of tribute.

These tribes were grouped under five provincial kings, who ruled over the five provinces of Ulster, Leinster, Munster, Connaught and Meath. The high-king has been alluded to. This high-kingship for many centuries was a military prize, but gradually it became hereditary in the Hy-Niall line, from which are descended the chiefs of the O'Neills. One of this family (Niall of the Nine Hostages) was so powerful that at the time the power of the Romans had declined in Britain, he led several raiding expeditions against Scotland and Wales.

The next king to make a lasting record was Loigaire, who was high-king when St. Patrick began his work in Ireland; in fact he, with the Druids, bitterly opposed the bishop. This was early in the fifth century.

Then came the ravages of the Danes, which persisted until the advent of Brian Boroimhe who, in the beginning of the eleventh century, united the greater part of Ireland under his scepter, restored public tranquillity and subdued the northern invaders. It took him twenty years to conquer Malachy, who disputed his rule in Ireland. Malachy was a distinguished warrior himself who wore a collar of gold won from the Danish invader. When he disposed of Malachy, Brian became high-king of Erin.

But we have swept past some other notables of the Viking movement against Ireland. The early part of the ninth century saw the invaders endeavor to establish a permanent colony on the island. One of their chieftains, Turgesius, erected a kingdom in the north, with Armagh as its capital. But the king of Meath captured Turgesius and caused him to be drowned in Lough Owel, without, however, discouraging the Vikings. The Danes met with large success, but simply could not subdue the Irish because of their tribal organization. They built towns, nevertheless, and built up considerable trade. They founded Dublin, Wexford, Waterford, Limerick and Cork—the first towns to be built in Ireland.

Then came the two famous brothers to champion and unite for Ireland's cause. One died but the younger, Brian Boru, the Brian mentioned above, became king of Munster. He fought for Ireland. When the king of Leinster joined the Dublin Danes, Brian Boru turned on him and crushed him. Then with his enhanced power and prestige he entered on his great campaign, already noted, again Malachy, the king of Meath.

Brian Boru's rule was remarkable. He kept order by hanging robbers and thieves, and giving a certain stern justice to all. He was a patron of learning, rewarded scholars, and sent far across the seas for precious books. Also he built churches and forts and tried to open up the country with bridges and roads.

This lasted for 12 years, when some of the provincial chiefs began to get restless and ambitious. The king of Leinster acted first, making an alliance with the Dublin Danes and making the rash decision to engage old Brian Boru in battle. Brian summoned his men from Munster, Connaught and Meath, advanced toward Dublin, fought from sunrise until evening, massacring the Danes liberally, and driving the remnant so far into the sea that the Vikings never made much of an attempt after that to fight the Irish.

But unfortunately for Ireland a Danish fugitive killed the old king Brian as he lay in his tent. He was less wise in his death than in his life, for he divided the island among his three sons, and inevitable dissension broke out. It was through this dissension that the English kings entered on the scene. Dermot MacMurrough, king of Leinster, being expelled by his rivals, appealed to Henry II for aid, and Henry, armed with a papal bull (which some say was forged) authorizing him to take possession of Ireland, gave Dermot permission to raise allies. Foremost among the adventurers who responded were Robert Fitzstephen and Maurice Fitzgerald to whom Dermot promised the town of Wexford, and the Earl of Pembroke, known as Strongbow, to whom Dermot promised his daughter and the succession to the crown.

Dermot regained his kingdom of Leinster, and came to terms with the high-king, Roderick O'Connor. This accomplished, both wished to effect the withdrawal of the Normans; but this was difficult, and Strongbow, in particular, began to acquire so much power that Henry II became alarmed. Henry came to Ireland, with a great array of troops, and so impressed were the native Irish with this display that nearly all the chieftains paid homage to the English king.

Henry appointed his own men to positions of control, confirming Strongbow, Fitzstephen and Fitzgerald among others, in their possessions. The result was curious. Jealousies sprang up not only between the Normans in Ireland, but between them and the English kings.

Gradually the Normans in Ireland became more Irish than the Irish, and became identified more with the Celtic tribes than with the English overlordship. There remained notable loyal Anglo-Norman families, such as the Earls of Kildare, Desmond and Ormond. But gradually the Celts began to gnaw away the English rule, and by raids, helped along the confusion.

Then the Celts invited Edward, brother of Robert Bruce, to lead them against the English. He was defeated at last, but so badly shaken was English power that the powerful O'Neills were able to regain their lands in the north, as did many others; and many of the English subjects, seeing how feeble was the protection of their own government, joined the tribes.

From then on it is a story of attempt after attempt on the part of the English to make good their footing in Ireland. One Irish king (self-styled) stands out; he is Art MacMurrough Kavanagh, king of Leinster who, in the reign of Richard II of England, chased the English Army many a disastrous mile and maintained for a half century a large and independent kingdom just without the bounds of English influence.

(C) Harris & Ewing

The originals of the Declaration of Independence and the Constitution of the United States are deposited in this ordinary safe of thin steel, proof neither against fire nor water, which stands in the library of the State Department, Washington, surrounded with combustible material. A request for $20,000 to provide a fireproof vault has been omitted from the appropriation bill. This request is made and ignored every year. It is stated that this safe would not stand a severe fire more than twenty minutes.

The Wood Hollow Papers

By ROBERT PAGE LINCOLN

THE cankerworm is one of the most obnoxious and harmful pests that we have with us. Their numbers are legion and but for the winter birds I do not know how the world would fare, in our northern region especially, which is one of surpassing woodlands and a foliage that presents in summer virtually one solid wall of greenery. The apple orchards in this region are sprayed with arsenate of lead and lime before the buds come out and once again after the buds are out and bursting. The reason for spraying before the buds are out is to catch the vanguard of the cankerworm hosts which are at that time appearing ready to get at the buds when they burst. Those not killed then, it is aimed, will be killed by the second ablution after the buds are well under way. Where trees are small and easy to reach with the spray no doubt most of these cankerworms are wiped out of existence, but where trees run tall and the branches are wide-spreading it is hard to reach every spot no matter how diligent and painstaking one may be. It is the spring cankerworm, *Anisopteryx vernata,* that is the most harmful, but it should be remembered that we have also with us the fall cankerworm. This autumnal blackguard (or blackguardess) waits until the birds have mostly moved out of the region on their southern migration, and then, at her leisure, deposits her eggs in the crevices and knot holes. But there is a brave little crew of birds that have not flown South and as between woodpeckers, nuthatches, brown creepers and chickadees the eggs that the fall cankerworm deposits are pried out and disappear as bird food. In one small apple orchard I have counted on one day in the winter, all busily at work on the trees, six downy woodpeckers, four hairy woodpeckers, seven creepers and one nuthatch; and on other days have counted as high as ten and fifteen chickadees. It is given the chickadees to glean through the branches while the other birds take care of the tree trunks. It is this ceaseless work of the birds in the winter that counts. Their preservation is of the utmost importance. They are assets of incalculable value.

You will not be confused in knowing the cankerworm when I tell you that it is the so-called "measuring worm." It is the half-inch long worm that makes its way over the leaf or the tree by arching its back and putting its back "feet" up to the front "feet" every time it goes forward. Studied under the lens they prove to be discs set with insect "hobs." When the worm has securely fastened these rearmost foot-appliances firmly in the bark, or the twig, it feels safe to reach out and measure its length and at the point it then reaches it secures its front feet. Then it arches its back in the most sublime of staplelike curves and brings up its back feet to a position exactly touching the heels of the front feet. Ordinarily this measuring business goes on at a snail's pace, but once I witnessed a measuring worm going across a branch with a speed that betokened urgency spelled with a capital U. The way his back bent and unbent was a caution. He had all the agility responding in his body that is witnessable in an urchin when school lets out at the close of the season. The lad flits fleetly through the door with a lightninglike flash of feet—only the measuring person here mentioned had his own especially patented method of progress.

It should be well remembered that this so-called cankerworm is not really a worm, but is a caterpillar. You may have an idea that his earthly mission ends with this wormlike stage but this is only the beginning. As a "worm" or caterpillar he lives only to eat and grow. When he has had his fill he produces a glutinous secretion and touching this to a leaf or a limb he suddenly lets himself down to the ground, much as a spider does; the gluten producing a gossamer thread spun as he descends. At times under the trees you will see the air full of them, all of them bound for earth. Upon reaching the ground they at once work themselves down one or two inches in the soil and there undergo metamorphosis, or the complete change from the larva to the moth.

It is remarkable how many moth creatures, great and small, there are to be found flitting about in the summertime and all of them pass through the caterpillar stage. If in the summer evening you have a light burning indoors, great numbers of these moths will come flying up against the screen, in the endeavor to get in, strangely attracted as they are to the light. And if some get in they will fly around and around the illumination and like as not will finally fall into the lamp to smother or burn to death. If you will pick up one of these night moths and look at it closely you will probably find that it has a face that looks every bit owl-like. You will probably be surprised if you are told that these owl-faced moths are none other than the destructive cutworm grown up; or the moth that comes after the cutworm has eaten a-plenty, has bored into the ground and has come into the upper world again, not as a caterpillar but as a moth.

Where Tomorrow's Fuel Awaits Man's Effort

By EARL CHRISTMAS

THE great continental ice sheet, invading North America, left thousands of lakes in its path, sprinkled over the northern states from Minnesota to Maine. In Minnesota alone, there are 10,000 lakes and more, which are helping to make the North a great summer playground.

But the interrupted drainage of the glaciated region gave these states another priceless asset. When great fields of ice covered the ground thousands of years ago, nature was providing, by a curious paradox, a way for future generations to keep warm.

Peat, deposited in these lakes and marshes in quantities sufficient to make billions of tons of fuel, has been the beneficent gift of the ice sheet to Wisconsin, Minnesota, Michigan, New York and the New England states.

In the peat bogs, scattered over nine states and parts of a dozen others, there lies one of the great undeveloped resources of the nation, now beginning to attract serious attention with the appreciable diminishing of the available coal supply of the country. Only recently have we come to realize the immensity of these deposits, now apparently approaching development as a fuel.

In the state of Minnesota alone, there are 5,217,000 acres of workable peat with a potential supply of 6,835,000,000 tons of dry peat available for fuel, according to an extensive survey of the state completed recently by the University of Minnesota and the Minnesota Geological Survey under the direction of Professor E. K. Soper. Almost seven billion tons of peat—think of it! All the money in circulation in the United States wouldn't buy half of it, if it were all prepared for fuel and delivered to the door of the consumer. Selling at only $3 a ton, its value would exceed the deposits in all the national banks.

Of such proportions is this resource in one state. Other states likewise have vast quantities. F. W. Huels estimated that there are 3,000,000 tons of dry peat in Wisconsin. Michigan also has extensive deposits. According to the United States Bureau of Mines, workable beds of peat are common also through New York, the New England states and the northern sections of Iowa, Illinois, Indiana, Ohio and Pennsylvania.

Merchantable beds are common, too, through Florida, and occur in a narrow strip along the Atlantic and Gulf coasts.

The late Charles A. Davis, of the United States Bureau of Mines, estimated that the total quantity of machine peat available in the United States is approximately 12,888,500,000 tons. That's a staggering total when you try to comprehend it. As long ago as 1911, Dr. Davis put its value at $38,665,700,000, provided it sold at $3 a ton, and the probable value has increased since that time. It would furnish heat and power for the entire country for many years.

But the burning of peat has an individual as well as a national significance. For instance, consider this from Peter Christianson, professor of metallurgy in the School of Mines at the University of Minnesota:

"There is scarcely a farmer in the state of Minnesota, except in the southeastern, western and extreme northwestern portions, who could not make himself independent of a coal supply for heating purposes by preparing and using peat from his own farm. Incidentally, peat is found in 64 of the 86 counties of the state. Other states have lots of it too.

"All the man needs to do is to take a spade, cut the peat from his bog in blocks and dry it. He can do it cheaper than he can pay $15 or $20 for coal, too. My father burned peat for years here in Minnesota, and it made an excellent fire. Farmers are using it for fuel in some sections of the state, particularly those from the old countries who are acquainted with its use.

"Use of peat as a commercial fuel on a large scale is just as practicable. It's simply a problem in mechanical engineering, and processes are being perfected that will make it possible to produce a satisfactory fuel for many purposes at a price much cheaper than coal.

"Peat, properly prepared, is fully two-thirds as effective as the same quantity of ordinary bituminous coal. And it would cost much less. It seems a shame for these northern states to pay enormous sums for coal, and be dependent during long winters upon an often uncertain supply, when here at our very gates are these vast resources.

"All that is needed is initiative to start the enterprise on a large scale. In a few years, I am confident, peat will be utilized by many industries.

"One of the greatest possibilities in these almost unlimited fields, however, lies in the development of power. The time will come when these peat bogs, lying in many places like great, idle wastes, will be thriving centers of industry. Great power plants, located upon the beds, will transmit electric power to cities all over these states. By-products, worth millions of dollars, will pay for the great proportion of the cost of the power, and thousands of acres of land, now of little value, will be made fertile.

"That sounds like a dream, but it's coming as sure as day follows night. In fact, these very things are being done to some degree in other countries. Coal has been cheap in this country, and suitable machinery hasn't been developed for handling peat in the past. Now, however, considerable progress has been made in the development of machinery, and with the diminishing of our coal supply attention is turning more and more to peat."

Use of peat as fuel dates back almost to the dawn of history. The Latin authors, commenting on the condition of peoples to the north, related how they dug the soil from the marshes with their hands, and after drying it burned it to warm themselves and cook their food.

In Ireland, peat has been the only domestic fuel for the mass of the people from the traditional time when the island was de-forested. In fact, the peat fire on the hearth is an essential element of Irish national life.

Turf cut from the bog still is the only fuel over a wide portion of Northern Europe. It is cut into bricks with a spade made for the purpose, and laid out to dry, being stacked in sheds for the winter. It makes a splendid fire in an open fireplace or an ordinary stove if there is a good draught.

Machines for handling peat have been in use in Europe for many years, though only recently have they approached any great degree of commercial success. Development of the industry in some of the European countries has been aided by government appropriations and experimental work. In Sweden, particularly, has considerable progress been made. Powdered peat has been burned successfully as locomotive fuel there, comparing favorably with coal, and the government has erected several large peat-powder plants. Preparation of peat for fuel as a commercial enterprise also has been developed in Canada to some extent.

From 15,000,000 to 20,000,000 tons of peat fuel are used annually in European countries, according to the United States Bureau of Mines.

Top—Farmers in Cass County, Minnesota engaged in the preparation of fuel for the winter by the use of an ordinary plow. The strips can be cut into blocks of convenient size.

Bottom—This picture shows the rear of a new peat machine, illustrating how knives on the spreader cut the sheet of pasty peat into strips. Later they are crosscut into briquettes by another device. The peat is carried through the pipe at the side, macerated, and spread into the layers shown in the foreground.

Here in the United States, however, few people have any very definite idea of the value of peat as fuel. Most of us know that peat is an accumulation of vegetable matter, which has been partially preserved from decomposition by immersion in water. Most of us, too, have known that peat will burn—if it is dry.

Firemen in the northern states have been called out of the cities on occasion to put out peat fires. There have been instances, too, of roads burning up in a manner seemingly miraculous to the uninitiated, when they happened to run across peat lands, and there have been disastrous peat fires frequently in regions where marshes have been drained. For days these beds will burn, the fires extending often beneath the surface.

But few have realized that peat might replace coal and break to a large extent the dependence of some of the northern states upon distant coal mines.

For several months, a Minneapolis company has been engaged in the preparation of peat for fuel, said to be the only enterprise of its kind in the country. A machine has been perfected that digs, macerates and spreads out to dry 700 tons of wet peat in a day, or a quantity sufficient to produce 100 tons of dry fuel. That's how much peat contracts in the drying process. One man operates the machine.

During last summer, the machine was operated on a bog near Minneapolis, and peat, processed at the University of Minnesota, was burned with satisfactory results in a Minneapolis office building.

A crusher plant, with a capacity of 500 tons of peat a day, has been built in Minneapolis during the winter to produce powdered peat, and in the spring ten peat digging machines are to be started to work on the Minnesota bogs.

Peat machines of many types have been developed, but the machine in use in Minnesota, perfected by Herbert Garnett after twenty-five years of work, is perhaps the most effective type, according to Professor Christianson.

The great problem to be overcome in the preparation of peat for fuel is the removal of its water content, which runs as high as 80 and 90 per cent in the natural state. Draining of the bog removes part of the water, but the greater proportion must be removed by air drying. It requires about 90 days to reduce it to 20 per cent moisture, when it is ready for fuel. This involves considerable time, but no satisfactory method has been found to force the water from the peat artificially.

The Garnett machine digs to a depth of seven feet. The digging unit consists of a worm that mixes the different layers of peat together, passing it in a pasty mass to a conveyor, where it is further macerated. The pulped mass then is discharged on the ground at the rear of the machine in a sheet four inches thick and 16 feet wide.

Knives on the spreader cut the sheet into thin strips, and later another device crosscuts it into briquettes. After drying for several weeks, the peat is put into windrows for further drying. If it is to be used as a hand-fired fuel, the dry blocks are run through a crusher and delivered to the consumer the same as crushed coke. The cost of fuel prepared in this way will be about $2.25 at the swamp, according to Mr. Garnett.

Pulverized peat makes better fuel, however. In this case, the peat is run through a coarse grinder, a dryer, then a pulverizer and delivered to customers in tank cars and burned the same as powdered coal. Pulverized peat can be delivered to the boiler for less than $5 a ton, according to Mr. Garnett, who declares using peat will reduce the fuel bills of local industries fully 50 per cent.

Engineers conducting the tests at the Minneapolis office building burning peat said that a pound of the powdered coal used evaporated 9.9 pounds of water, a pound of pulverized peat 9 pounds, and a pound of coal hand-fired in the usual way from 5 to 6 1-2 pounds. The peat powder, fed into the furnace, under air pressure, burns almost like gas and with little smoke. Good peat fuel has an ash content not to exceed 15 per cent.

Effectiveness of peat, as compared with coal, varies, however, under different circumstances, and according to different authorities. Soper says that the heating value of the average peat is slightly more than .6 that of the heating value of the ordinary bituminous coal, while the best peat is about 75 per cent of the heating value of anthracite, and 80 per cent of the heating value of Illinois coal. The average thermal value of the better Minnesota peats runs from 9,000 to 10,000 British thermal units for moisture-free peat, he found.

Captain Ernst Wallagren, chief peat engineer for the Swedish Government, found, according to a recent Bureau of Mines bulletin:

"The peat powder when burned by the method used by Back was equal in fuel value to the best English coal, ton for ton. This discovery makes Sweden independent of other countries for fuel supplies for industrial uses."

Henry J. Hindshaw, engineer in the mineral lands department of the state of Minnesota, pointed out that powdered peat under some circumstances might be more effective than coal.

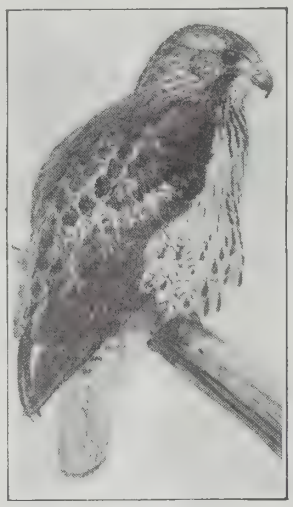
Government engineers have estimated the cost of producing peat fuel from $2 to $3 a ton. The machine peat, air dryed, is the cheapest. Compressed into briquettes, it is somewhat more desirable for domestic use, and slightly more expensive. Peat powder can be produced and delivered at less than $5 a ton, according to Mr. Garnett. From $3 to $5, then, would seem to be the consensus of opinion as to its cost.

There are varied possibilities in the use of peat. Very fine cloths have been made from the fiber in England. Coarse cloths and blankets have been made from it in Sweden. Paper has been made from it in the United States. Gas, charcoal, coke and a number of valuable by-products are produced from it.

Peat powder and fiber have been used in dressing wounds. Hundreds of thousands of surgical dressings were made from peat moss, or sphagnum, during the war. Sphagnum has many advantages over cotton for this purpose. Peat has exceptional antiseptic, absorbent and de-odorizing qualities.

Peat is used extensively as a filler for fertilizer. It may be briquetted with iron ores. There are millions of tons of fine dust not usable in the blast furnaces. Briquetted with peat, much of this can be used, Professor Christianson has found in an interesting series of experiments. A substitute for lumber, harder and tougher than wood, has been made by the mixture of peat and plaster of Paris.

Producer gas plants for generating heat and power offer perhaps the most effective way of utilizing peat, according to Professor Christianson. By-products, of which ammonium sulphate is the chief, would bring in vast sums. The ammonium sulphate from the by-product plant at Orentano, Italy, as long ago as 1913, paid for two-thirds of the cost of operation, and the demand for ammonium sulphate for fertilizer has increased greatly since that time.



So, all in all, we may find considerable recompense in the prehistoric visit of the glaciers.

Annual Insect Bill Almost Two Billions

By H. O. BISHOP

ACCORDING to a careful survey by the Bureau of Entomology of the United States Department of Agriculture, the depredations of injurious insects cause an annual monetary loss to American agriculture of the appalling sum of $1,554,869,300. The loss has grown since the foregoing estimate and is now reckoned at nearly two billion dollars.

Were it not for the constant destruction of insects by the birds of the United States, the damage to farm and garden products would, undoubtedly, be much greater.

RED-TAILED HAWK

The beneficial activities of birds is illustrated by the fact that in some places where especial attention has been paid to attracting and protecting birds the damage by insects has become practically unnoticeable. A careful estimate shows that the grasshoppers destroyed monthly by a single meadow lark would consume forage worth at the lowest valuation 50 cents. In the six months that may properly be included in the grasshopper season, therefore, each meadow lark prevents the loss of $3 from devastation by grasshoppers. The amount saved by the destruction of other injurious insects must be fully as great, so that a meadow lark may be fairly estimated to destroy insects capable of causing damage of at least $6 a year.

On account of its larger size, the meadow lark is considerably above the average of our insectivorous birds in its capacity for destroying insects. The value of many birds in preventing increases in losses from farm pests certainly can be estimated conservatively at $1 a year. But to give some idea of the way in which the benefits from the useful services of birds mount into large sums when estimated in monetary terms, and at the same time to be entirely on the safe side, we may set the average cash value of the destruction of pests of agriculture by birds at the ridiculously low figure of ten cents a bird each year. Numerous bird censuses have agreed in arriving at the figure of two birds an acre as the normal bird population of the country. On this basis there are each summer at least 3,806,500,000 breeding birds in the United States. This takes no account of young birds. At the rate of ten cents each, the value of these birds in preventing insect damage is $388,650,000 annually. The migrants that pass through the United States equal in number, if they do not surpass, the population of breeding birds. They spend on the average a month apiece in their passage, during which time they feed upon our injurious insects. Estimating the value of each of these birds in proportion to the time they are with us at one-sixth that of the native species, we arrive at an added saving of insect damage of $63,441,666, which brings the total to more than $444,000,000. This is a minimum estimate of the additional insect damage the people of the United States would have to endure were it not for the beneficial services of birds.

Yet, despite the valuable economic services performed by our feathered friends, they are slaughtered in vast numbers, either to provide a tasty meal, or just for the sake of wantonly killing something.

If the present small number of birds in this country is capable of destroying so many insects, thus preventing enormous losses to growing food crops, it can easily be surmised how great would be the value of birds if their numbers were largely increased through common-sense protection.

Dr. Albert K. Fisher, in charge of economic investigations of the Bureau of Biological Survey of the United States Department of Agriculture, investigated pellets found at the roost of a long-eared owl, and found remains of 95 meadow mice, 19 pine mice, 15 house mice, five white-footed mice, three Cooper's mice, 26 shews, and 13 birds, of which 11 were sparrows, one a bluebird, and the other a warbler. Eighty-six out of 92 stomachs examined by Dr. Fisher also contained mice. The little screech owl, according to Dr. Fisher, is a diligent mouser, also consuming grasshoppers, crickets, beetles, cutworms, toads, scorpions, lizards, crawfish, frogs and fish. As many as 50 grasshoppers have been found in one stomach, 18 beetles in another and 13 cutworms in another.

An investigation of 28 stomachs of hawks disclosed from five to 12 meadow mice in them. A few rats, house mice, shews, and other small mammals also were found.

Among other insect destroying birds is the nighthawk, or bull-bat, which breeds throughout most of the United States and Canada, and winters in South America. It is strictly insectivorous, and hence does no damage to crops. The only charge that can be made against the bird is that it destroys some useful insects, but these are greatly in the minority in its food. Nighthawks are so expert in flight that no insect can escape. In their capacious mouths they sweep up everything from the largest moths and dragon flies to the tiniest ants and gnats, and in this way sometimes gather most remarkable collections of insects. Several stomachs have contained 50 or more different kinds.

Ants comprise nearly a fourth of the birds' total food. These insects are generally annoying and often very injurious, especially on account of their damage to stored products and because of their habit of fostering destructive plant lice. More than a fifth of the nighthawk's food consists of June bugs and beetles. These are the adults of white grubs, noted pests, and even as adults many members of the family are decidedly harmful.

Nighthawks are much less numerous than formerly, chiefly because of wanton shooting. They are given full legal protection almost everywhere, and citizens should see that the law is obeyed. The bird is far too useful and attractive to be persecuted.

No bird is better known to country residents than the bobwhite. The bird's cheery calls the year round form part of the most pleasant associations of country life, and its neat form and harmonious coloration, and especially its confiding habits, make it a general favorite.

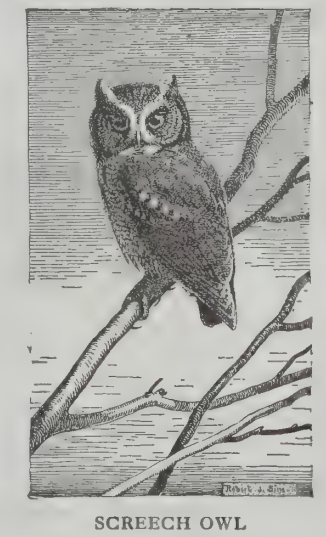
Animal food, chiefly insects, comprise nearly a sixth of the bird's subsistence. From June to August, inclusive, when insects are most numerous, their proportion in the food is about 36 per

BOBWHITE

cent. The variety of insect food is great and includes a number of the most destructive agricultural pests. Among them may be mentioned the Colorado potato beetle, 12-spotted cucumber beetle, bean leaf beetle, squash ladybird, wireworm. May beetle, corn billbug, clover leaf weevil, cotton boll weevil, army worm, bollworm, cutworm and chinch bug. The food habits of the bobwhite undoubtedly are beneficial and the bird should be maintained in numbers on every farm. This is not to say that all shooting should be prohibited, for the bird is very prolific. But its numbers should not be reduced below what the available nesting sites and range will support. On the other hand the policy of absolute protection recently adopted by one state, is not called for by strictly economic considerations.

In food habits the house wren is entirely beneficial. He may be said to live upon animal food alone, for an examination of 88 stomachs showed that 98 per cent of the contents was insects or their allies, and only two per cent was vegetable food, including bits of grass and similar matter, evidently taken by accident with the insects. Half of this food consisted of grasshoppers and beetles; the remainder of caterpillars, bugs and spiders. As the wren is prolific, frequently rearing in a season from 12 to 16 young, a family of these birds must cause considerable reduction in the number of insects in a garden. Wrens are industrious foragers, searching every tree, shrub, and vine for caterpillars, and examining every post and rail of the fence and every cranny in the wall for insects or spiders.

Examinations of the stomachs of 1,236 robins show that 42 per cent of its food is animal matter, principally insects, while the remainder is made up largely of small fruits or berries. More than 16 per cent consists of beetles, about one-third of which are useful ground beetles, taken mostly in spring and autumn when other insects are scarce. Grasshoppers make up about five per cent of the whole food, but in August they comprise 17 per cent. Caterpillars form about nine per cent, while of the rest of the animal food, about 11 per cent is made up of various insects, with a few spiders, snails, and angleworms. All the grasshoppers, caterpillars, and bugs, with a large portion of the beetles, are injurious, and it is safe to say that noxious insects comprise more than one-third of the robin's food.



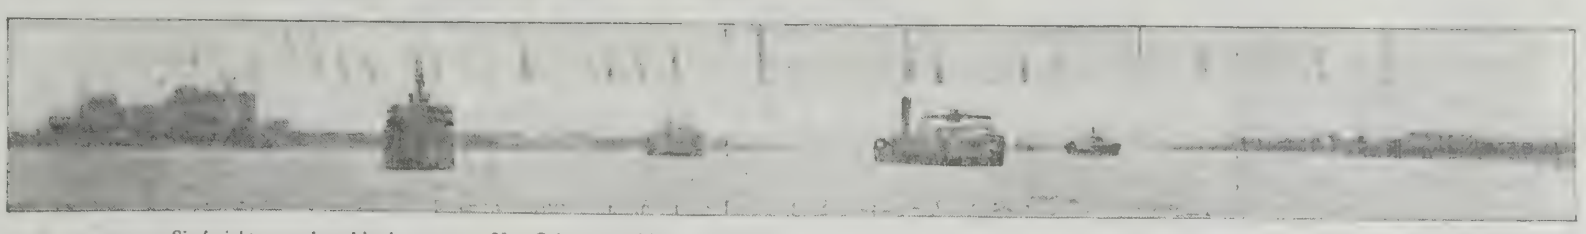
The stomachs of 645 catbirds were examined and found to contain 44 per cent of animal (insect) and 56 per cent of vegetable food. Ants, beetles, caterpillars, and grasshoppers constitute three-fourths of the animal food, the remainder being made up of bugs, miscellaneous insects, and spiders. One-third of the vegetable food consists of cultivated fruits, or those which may be cultivated, as strawberries, raspberries, and blackberries; but while we debit the bird with the whole of this, it is probable—and in the eastern and well-wooded part of the country almost certain—that a large part is obtained from wild vines. The rest of the vegetable matter is principally wild fruit, as cherries, dogwood, sour gum, elderberries, greenbrier, spiceberries, black alder, sumac, and poison ivy. Although the catbird sometimes does considerable harm by destroying small fruit, it cannot on the whole be considered injurious. On the contrary, in most parts of the country it does far more good than harm.

Seven common species of swallows are found within the limits of the United States, four of which have abandoned to some extent their primitive nesting habits and have attached themselves to the abodes of man.

Field observation convinces an ordinarily attentive person that the food of swallows must consist of the smaller insects captured in mid-air or picked from the tops of tall grass or weeds. This observation is borne out by an examination of stomachs, which shows that the food is made up of many small species of beetles which are much on the wing; many species of mosquitoes and their allies, together with large quantities of flying ants; and a few insects of similar kinds. Most of these are either injurious or annoying, and the numbers destroyed by swallows are not only beyond calculation but almost beyond imagination.

The eastern bluebird, one of the most familiar and welcome of our feathered visitors, is a common inhabitant of all the states east of the Rocky Mountains from the Gulf of Mexico to southern Canada. In the Mississippi Valley it winters as far north as Southern Illinois, and in the East as far as Pennsylvania. It is one of the earliest northern migrants, and everywhere is hailed as the harbinger of spring. Very domestic in habits, it frequents orchards and gardens, and builds its nests in cavities of trees, crannies in farm buildings, or boxes provided for its use.

It is evident that in the selection of its food the bluebird is governed more by abundance than by choice. Predacious beetles are eaten in spring, as they are among the first insects to appear; but in early summer caterpillars form an important part of the diet, and these are later replaced by grasshoppers. Beetles are eaten at all times, except when grasshoppers are more easily obtained. As far as vegetable food is concerned bluebirds are positively harmless. The only trace of useful products found in their stomachs are a few blackberry seeds, and even these probably belonged to wild rather than cultivated varieties. Other seeds found were: chokeberry, juniperberry, pokeberry, partridgeberry, greenbrier, Virginia creeper, bittersweet, holly, strawberry bush, false spikenard, wild sarsaparilla, sumac, rose haws, sorrel, ragweed, grass and asparagus. This list shows how little the bluebird depends upon the farm or garden for food, and how easily by encouraging the growth of such plants, the bird may be induced to live on the premises.



SCREECH OWL

Two species of bluebirds inhabit the western states—the mountain bluebird and the western bluebird. In food habits they are even more to be commended than their eastern relatives.

Many other birds are equally as beneficial to agriculturists as those mentioned above.

It's far better to cultivate birds than to assassinate them.

Six freighters anchored in the stream at New Orleans, awaiting an opportunity to get up to the wharves. Public ownership of the harbor front and operation of all port equipment is alleged to be responsible for this condition of shipping at the Louisiana port.

Would Turn Port Over to Private Capital

By ROBERT MORGAN

AFTER two hundred years of experimenting with public ownership of the 41 miles of water front on its harbor, the port of New Orleans is preparing to appeal to the Louisiana state constitutional convention, in March, 1921, to grant private capital the right to develop the port. In this plea to the convention which is to give the state a new constitution, it is stated that, though export and import commerce through the port has tripled in the past three years, port equipment and facilities, such as terminals, wharves, warehouses, wharf houses, anchorages and cargo loading and unloading machinery are only about 50 per cent adequate to the demands put upon them.

New Orleans is one of the few ports in the world in which all—or virtually all, save one or two small pieces—of the land along the harbor front belongs to the people, in this case to the city of New Orleans and the state of Louisiana. This land and the improvements thereon are administered for the state and city jointly by the board of commissioners of the port of New Orleans. The publicly-owned land can be neither leased nor sold. All improvements put upon it, and all development done to it, must be done by this board of commissioners, better known, locally, as the "Dock Board." Several firms, notably the New Orleans Green Coffee Association, have advanced money to the dock board for the construction of wharves, wharf sheds and warehouses, such loans being repaid by rebates on the rentals paid by the lending company to the dock board each year.

This method, however, precludes the interest in the development of the port which shipping firms, shipowners and maritime corporations generally would have were they able to own their property, or, at least, to own the improvements in the shape of buildings and equipment thereon. It has prevented the building by private capital of such improvements as the Bush Terminals in New York, the Manchester port works in England, or the recently commenced Cunard Line docks in New York, representing an investment of $40,000,000. The dock board never has been able—though all the publicly-owned equipment of the port returns a profit each year—to get together money enough to develop the port of New Orleans commensurately with the growth of commerce passing through that port. It has been difficult even to provide adequate terminal facilities for the government-owned and operated barge lines on the Mississippi and Warrior rivers.

To correct this condition, the city of New Orleans, through all its commercial organizations, headed by the Association of Commerce, and supported by similar bodies throughout the state, as well as by the city government and by a number of prominent officials of the state, has prepared a plea to be presented to the constitutional convention. This plea asks, in brief, that in the new organic law, the dock board be allowed to give long-term leases on water front lands to any individuals or corporations wishing to construct terminals, wharves, docks, slips, wharf houses, warehouses, bunkering coal plants, loading and unloading machinery, or other facilities for the reception and handling of shipping into and out of the port. These leases are to be granted only to persons and firms who will build and operate the port equipment for their own use. Erection of such improvements for rental is forbidden.

The dock board, under this new law, is to have the right at all times to take over these improvements, on the payment of their cost, a statement of such cost to be filed with the board at the time of completion of the improvements in question. In addition to this, individuals and corporations are to be given the right to purchase land adjoining and behind the water front, for warehouses, factories, and similar industrial buildings, with the privilege of connecting their water front improvements with these structures. None of the water front land is to be sold. Included in the plan is also the employment of a port manager, preferably from outside New Orleans, to be responsible directly to the state and city for the management and control of the harbor, the water front and the port equipment located thereon. Details of two and three-story wharf sheds, as compared with the one-story sheds so far erected; closer connection between the municipally-owned Public Belt Railroad, which girdles the water front, linking all wharves with trunk line rail stations, and the ship terminals, and development of nearly 35 miles of harbor front which the dock board has been unable to improve, are the results sought in the new plan. The port facilities committee of the New Orleans Association of Commerce, to which was delegated the drawing up of the plea to the constitutional convention, supplied the following outline of the project, which has been approved by the board of directors of the association, by the other commercial and maritime organizations and corporations of the port, and by a number of state and city officials:

"Under the existing policy of public ownership, the dock board has borrowed sums of money from steamship lines on unsecured due bills, built wharves and sheds with the money, and given first call on these improvements to the companies lending the money. Often, through force of circumstances, the dock board has been compelled to land ships belonging to other companies at these wharves. No water front warehouses were created, and, consequently, the wharf houses, intended for temporary shelter for moving cargoes only, have had to serve as warehouses during both the assembling and the distributing periods. In the absence of continued and uninterrupted use of specific wharves, steamship lines have been handicapped in the development of their business. Under this system of borrowing, the lender makes such loans out of his capital. For this reason, such a lender never will provide more money than is required to create the minimum facilities to serve his purpose.

"The dock board has not been able, and will not be able for years, according to all present financial forecasts, to finance port facilities on a scale adequate to care for the commerce of the port. We find that the policy of public ownership under which the port facilities at New Orleans are and may be provided is so narrow as to exclude, in a very large measure, financial cooperation by steamship lines, shipping concerns, warehouse men and others, who, at other ports, invest large sums in creating facilities they require for the economic conduct of their enterprises.

"Thus, through public ownership, the port of New Orleans is being denied the great impetus such investments would give its development, while water carriers and commerce generators, lacking that responsibility to the port which heavy investments in terminal facilities would create, are free to withdraw service from the port on the slightest provocation.

"In striking contrast, the Cunard Line is now investing $40,000,000 in creating terminal facilities for its own ships in New York Harbor, where public ownership does not prevail, and New York always may depend on the sustained co-operation of that line to build up and protect the interests of that port. But, should the Cunard Line come to New Orleans, under existing port conditions, it would not be permitted to build its own terminals, but would be compelled to take whatever the dock board had to offer. Thus, lacking an invested interest, it would not feel a permanent interest in New Orleans, either as a port or as a city, such as it feels in New York.

"The Association of Commerce, while not suggesting full return to private ownership, does urge the leasing of harbor frontage to steamship lines desiring to obtain adequate equipment beyond the power of the dock board to give. It also suggests that steamship lines be permitted to purchase land back of the harbor frontage, and erect thereon terminals of the magnitude and size required. Such leases should be for an indefinite term, and the dock board should have the right to take back the sites at any time the public need demanded that they be returned to the board."

Resolutions adopted by the board of directors of the Association of Commerce, which will form the basis of the measures presented to the constitutional convention, suggest that the dock board:

"1. Employ competent terminal engineers and port economists to make a thorough survey of the port and its needs, and to recommend a

(*Concluded on page 14*)

Above—Private equipment for unloading tropical fruits on the publicly-owned wharves at New Orleans. The port is about 50 per cent behind its commerce in port equipment, wharves, terminals, etc., and now wishes to drop the bars of public ownership to permit all steamship corporations to install equipment, build terminals, construct wharves and warehouses and otherwise improve the port.
Below—The first shipment of motor trucks from New Orleans to India. These trucks, "knocked down" and packed in cases, as shown, had to be handled by hand, with block and tackle, due to lack of proper and adequate loading facilities.

Credit—Solving Farmer's Greatest Problem

What South Dakota Is Doing With Its Rural Credit System

By R. P. CRAWFORD

CREDIT apparently is the farmer's greatest problem—a fact which is especially evident right now. Rural credits is a subject that has formed the center of many discussions for years, and it generally ends up by leaving things as they are. But in this matter it is worth while to examine the accomplishments of the state of South Dakota which is probably the first state in the Union that has a real working system in operation. Twenty-eight million dollars may seem like a huge sum of money, but it represents the amount that has been loaned the farmers of that state the last three years through its rural credit system.

The South Dakota system is to some extent modeled after the Federal Farm Loan Banks and is especially important since the work of the Federal Land Banks is tied up in the courts. It is also important right now when it has been almost impossible to secure loans anywhere and the banks have been sorely pressed to keep a sufficient reserve on hand. I rather imagine that more than one South Dakota bank will have to thank the rural credit system of that state by the time the crisis is over. In many cases farmers have been able to secure money through the rural credit department and use it to square up their obligations at the local bank.

The South Dakota system depends for its existence upon long-time mortgages on farms. These are taken for a period of thirty years. By paying a very small amount each year, a farmer is able to wipe out his indebtedness without feeling the strain to any appreciable extent. This is really about the only solution of things for the renter or young man who wants to make a start in farming today. The capital of the present-day farm, counting land and improvements, is usually greater than the capital of the bank or of any of the stores in that immediate section. Few men who enter the farming business are born with a silver spoon in their mouths with the exception of those who inherit the family farm. This system is designed to help the average farmer. For instance, at 7 per cent, the present rate, a farmer pays back but $8.06 per year for each $100 that he has borrowed. This includes both principal and interest. At 6 per cent, the old rate, the payments were but $7.26 per year on each $100 borrowed. Doubtless, arrangements will be made to lower the rate for those who have had to borrow under the advanced rates of interest today.

Picture a bank where applications for loans amounting to a total of $100,000 to $250,000 are coming in every day, and you have an idea of the amount of business transacted by the South Dakota Rural Credit Board. Although the rural credit system just got under way in the autumn of 1917, to date approximately $28,000,000 has been loaned. Somewhat more than $52,000,000 worth of applications for loans have come in, and a large number of necessity have had to be turned down because they did not meet the requirements of the rural credit board. Three hundred twenty-five applications for loans were received during the first nine days of December. Of course only the most urgent cases are taken care of at present, for the board might readily be swamped with applications for money which would not be wisely invested. In case a farmer is financially embarrassed at the bank, the board can often arrange to place a long-term loan on his land, and furnish him with money with which to pay up his most pressing obligations at the bank, thereby easing up the credit situation in that community.

Most people might wonder where this money comes from. If you have seen the circulars of the large bond houses, you have probably seem the farm loan bonds of South Dakota offered for sale. The money is secured by selling large blocks of these bonds to the large eastern houses which in turn sell them to investors throughout the country. The state of South Dakota guarantees the payment of them, which gives better surety to the investor than if he simply purchased an ordinary mortgage and perhaps had to run the risk of looking after a number of legal and technical details himself. The plan of the rural credit system was largely worked out by United States Senator-elect Peter Norbeck of that state when he was governor. The board of directors includes the governor, a commissioner, C. M. Henry, a treasurer, vice president, and also a secretary. This board passes on the applications for loans. The very first loan that the board made was to a renter who was enabled to become an owner of a farm.

However, it must not be thought that anyone can borrow money just for the fun of doing so. There are certain definite requirements that must be met. First, the applicant must be a resident of the state of South Dakota and the owner or prospective owner of farm land on which a long-time mortgage is to be placed. The rural credit board is authorized to lend up to a maximum of 70 per cent of the appraised value of the land, plus an additional 40 per cent of the insured value of the improvements. No loan can be made for a total of more than $10,000 and no loan for improvements on the land can amount to more than $5,000. This provision is to prevent big landowners from getting heavy mortgages on their land; in short, it is designed to help the man who is just getting a start. It is especially interesting to note that the average amount loaned per acre from October 20, 1917, to June 30, 1920, was $16.21. The largest number of loans had been made in Perkins County, in the northwestern part of the state, and the total number of loans there was 512, with an average of $5.53 per acre. The next largest number, 329, was in Haakon County, west of the Missouri River, where the average was $5.76 per acre. It will be seen that the system is especially popular in giving the small farmer a start, just as in years past the free government homestead was a great aid in helping those who had a great deal of ambition but little money. In fact, the state of South Dakota hopes that the credit system will do much to develop the more sparsely settled sections of the state.

The money borrowed of the credit board must be used for the purchase of farm lands, for the purchase of equipment, fertilizers, and live stock, for buildings and improvements, or to liquidate the indebtedness of the owner. Needless to say, loans are made only on land located in the state of South Dakota. Applications are made direct to the rural credit board and there are no fees or commissions to pay, except that the applicant must see that all of his papers and abstracts are correct. The credit board, of course, must see that there are no loopholes and that the loan can be made safely on the particular land.

Naturally the state must depend on the law of averages in insuring the success of the system and must make a small profit with which to pay operating expenses and build up a surplus. The bonds have been sold at interest rates varying from 4.75 to 6.17 per cent, while the loans have been made at rates varying from 5.50 to 7 per cent. It must be remembered that the bonds draw interest semi-annually, while the farmer pays but once a year, and there is always some little time before the money on hand is all loaned out. To cover these items and the cost of administration, the state must ask a higher rate from the borrower than it pays on the bonds.

The borrower is permitted to repay all or any part of his loan at any interest date after five years. There undoubtedly will be those who may want to get money at cheaper rates later and it is possible that the rural credit board will make some arrangements to make new loans to those who are now paying the maximum rates. Of course the present interest rates on the bonds will have to be taken into consideration and the law of averages over a number of years would show just how much reduction in interest there could be and still take care of the bonds. The present maximum interest rates on the bonds will probably have to be paid only a short time, and the average rate on the bonds over any long period of years will be far below it. The law provides that at all times the amount of mortgages and cash shall equal 95 per cent of the bonds outstanding. Undoubtedly in a few years some surplus will be built up.

A plan somewhat similar to the rural credit plan and working in conjunction with it is one by which ex-soldiers are given an opportunity to own farms. In this case the soldier needs to furnish only 10 per cent of the appraised value of the land and 20 per cent of the value of the improvements. The rural credit board supplies a loan of 70 per cent of the value of the land, and the additional money is secured through the land settlement board.

It is not intended to encourage the buying of high-priced lands in the eastern part of the state, but rather the cheaper lands, on which a good start may be made with small capital. It is especially interesting to note that 70 per cent of the soldier loans have been made on lands west of the Missouri River and 30 per cent on lands east of it. Just as in the case of the rural credit loans, not more than $10,000 can be loaned to any one person, and it is further provided that not more than $3,000 of this amount can be expended for live stock and improvements. The loans to soldiers are made on a thirty-year amortization plan, the same as the rural credit loans. Only soldiers who were credited to South Dakota in the war can take advantage of the plan.

That the popularity of a rural credit system is growing is indicated by the fact that the South Dakota officials have received inquiries from fifteen other states, indicating interest in establishing such systems. It seems evident that either the Federal Farm Loan System will have to be revived, or that states will have to go into the business, or else that private capital be made available on long-time amortization plans. The old-time mortgage comes due at too frequent intervals and there must be constant renewals and commissions to pay. Some years ago a man could go out and take a homestead, but today there is little homestead land left. It would seem that some system which would enable a man to buy cheap, but good land, and pay for it as he goes along, would best fill the needs, and South Dakota seems to have done this to a large extent.

Would Turn Port Over to Private Capital

Concluded from page 13

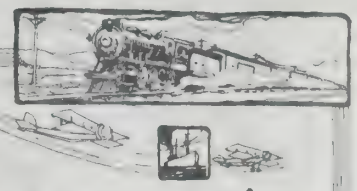
permanent continuing plan for the adequate development of the port; for obtaining adequate additional funds, and for encouraging business enterprise in aiding the dock board to create adequate facilities.

"2. That, either through public or private enterprise, a terminal and warehouse be created on the harbor front for even-running packages, such as coffee, sisal and similar commodities of import and export.

"3. That business enterprises be encouraged to construct and operate warehouses and such structures as may be needed back of the river front wharves, on either publicly or privately owned property."

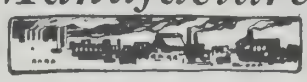
The report then continues:

"New Orleans needs river front terminals, in principle at least, like the Bush Terminal in New York, or the great terminal at Manchester, but these obviously cannot be obtained under the present system of public ownership and public development. The commerce of New Orleans requires permanent facilities for indefinite storage at ship, boat and rail side—storage not subject to such penalties as the dock board has recently found necessary to apply to merchandise left on the wharves more than seven days, in order to clear the wharves for other ships . . . .



"In the development of our present-day policy, New Orleans has gone to the extreme of public ownership and operation, and has overlooked the fact that a combination of public ownership and business investment and operation would bring into action the best in both systems. Private enterprise never can gain any freehold rights in the harbor of New Orleans, because the public owns 41 miles of harbor frontage and never can sell any part of it. If the dock board would capitalize a part of this enormously valuable economic asset by entering into a sound business arrangement with desirable steamship lines to build thereon the character of terminals they require, millions of dollars soon would come to the assistance of New Orleans in promoting its port development."

The port of New Orleans was established, coincidentally with the founding of the city of New Orleans, by the French in 1717, and from the beginning the public was given ownership of the entire harbor frontage. This public ownership was made perpetual by the Louisiana Purchase Treaty of 1803. The port is located on the east and west banks of the river, 110 miles by water from the Gulf of Mexico. Its harbor averages three-quarters of a mile in width and 30 to 200 feet in depth all the way from the outer end of the jetties in the Gulf to Baton Rouge, the state capital, a distance of 237 miles. Forty one and a fraction miles of this tremendous deep-water harbor lies within the limits of the city of New Orleans, which is co-lineal with the Parish of Orleans, a trifle less than 21 miles of harbor lying on each side of the river. From New Orleans to the Gulf there is a minimum depth of 60 feet, and in midstream at New Orleans, the depth is well over 175 feet. The number of vessels which can be accommodated in the stream is virtually unlimited, but development of the wharves and other port equipment is far behind the needs of the port, and, in the opinion of commercial and shipping interests, never can catch up with the advancement of ship traffic under the present system of public development, which has no capital and must build only such wharves and terminals as are absolutely indispensable, and even those only when some corporation or individual, needing such facilities, advances the money.



The dock board took charge of this great port on May 29, 1901, and, to October 1, 1920—the date of the board's latest report—had improved only about seven miles of the east bank of the river, on which is located the main part of the city. Wharves, steel sheds, cotton compress and warehouse, grain elevator, and a coal tipple have been built. Wharves, elevators and warehouses built by private capital, mainly on the west bank of the river, in suburbs of Algiers, Gretna, McDonoghville and Westwego, bring the total improved part of the port up to 45,000 lineal feet, or less than nine miles, out of a total of 41 miles. This developed section has a deep water area of more than seven square miles, but is less than 50 per cent adequate to handle the commerce of the port, according to the figures of New Orleans commercial organizations and shipping firms. The entire port can berth only 90 vessels of a maximum length of 500 feet, simultaneously, and there are cargo-handling facilities for about one-third this number. The result is that ships have to be docked "tandem," anchored in midstream, unloaded into lighters, or have their cargoes handled in other makeshift methods, which the coming constitutional convention will be asked to remedy by reversion from the present exclusive public ownership to private business enterprise.

The Three Arts

Agriculture — Manufacture — Transportation

As a result of various experiments, government experts have decided that Marquis wheat is the best variety of common wheat for the Northern Great Plains. Experiments were carried on at eleven stations. Marquis wheat was first introduced in the United States in 1915. It was brought from Canada.

All but two of South Dakota's gold mines were closed in 1920 because of the high cost of mining. The two mines operated produced gold to the value of $4,339,000. Production of all mines in 1918 exceeded $6,500,000.

Trade Commissioner Arthur Young reports that American exports to Spain increased 240 per cent from 1914 to 1919. The 1914 total was $30,000,000 while that of 1919 was $102,000,000.

Wooden shipbuilding companies won their case when they appeared before the Shipping Board and argued for prompt settlement of all outstanding claims. Many of the companies faced bankruptcy if the government refused to pay amounts due, it was shown. The total sum involved is between $6,000,000 and $10,000,000.

The Bureau of Statistics of the Labor Department announces that the cost of food declined eight per cent in December over November figures.

The Interstate Commerce Commission is investigating railroad rates in North Dakota to determine whether they are discriminatory against interstate commerce.

New South Wales reports a disaster to its wheat crop as a result of a terrific rainstorm. It is estimated that twenty per cent of the crop has been destroyed, the total loss being about 5,000,000 pounds.

Chinese bankers have agreed to finance the purchase of rolling stock for China's railroads. Bids on locomotives and cars will be asked soon.

Argentina's new oat crop is officially estimated at 60,500,000 bushels. The crop last year was 58,000,000 bushels.

The potato yield in Scotland in 1920 has been very successful. It is estimated that more than 1,230,000 tons of potatoes were produced. This is 400,000 tons more than last year and the largest return since 1885. The yield per acre was 7.6 tons.

Canadian ticket agents now demand United States money or Canadian money plus exchange for tickets for points in the United States. Hundreds of Detroiters have been going to Windsor, Ontario, to buy their tickets for southern and western trips, because the rate of exchange enabled them to save a neat percentage. The new rule puts an end to this practice.

The Louisville, Kentucky, Live Stock Exchange has launched a campaign to encourage farmers to revive the live stock industry.

A new type of river boat, electrically driven and propelled by a stern wheel, will soon appear on the Ohio River. Minus the paddle wheel at the stern the craft would have strong resemblance to the freighters of the Great Lakes.

The United States spends more money on tobacco than it does on automobiles. Two billion dollars a year is spent on autos but the tobacco bill exceeds this by $200,000.

Five hundred and thirty miles of hard road were built in Illinois in the last two years. Pennsylvania built 50 miles more than the Sucker State.

Several states have enlisted Federal assistance in the work of establishing farm management departments. One of the most important phases of the work is reworking principles of business management to fit farm conditions.

National forests in the eastern part of the United States are yielding a rapidly increasing revenue to the government.

A car of alfalfa seed recently shipped from Kansas sold for $8,500.

Our trade with Germany during 1920 amounted to $400,000,000. This was $153,000,000 below our biggest year's business with that country.

Anthony Caminetti, commissioner general of immigration, has returned from a two months tour of Europe. He reports that unless precautions are taken to keep diseased immigrants from obtaining visés that our receiving stations in this country will soon be obliged to contend with a very large number of typhus cases.

Rinderpest, a cattle plague, is destroying great numbers of cattle in Europe. The disease has never been known in this country.

The Department of Agriculture advises the use of sweet cream butter because of its excellent keeping qualities.

Canada's 1920 field crops returned a value of $1,636,664,900, according to the Dominion bureau of statistics.

There are more than 2,000,000 miles of unimproved highways in the United States.

The Armour Company, one of the members of the "Big Five" group of meat packers, has announced that its 1920 sales totaled $900,000,000 and that the net profit was within a few dollars of $5,320,000.

The Detroit Board of Commerce is planning to hold a second waterways convention in March for the purpose of assisting in the campaign for the Great Lakes-St. Lawrence deep waterway.

The railroads will grant decreased rates of fare to conventions this year.

Farmers of Williamsport, Maryland, are planning to kill their own cattle and sell the meat at a co-operative store to be opened there. They say that they will sell all cuts of beef at an average price of 14 cents, and make a reasonable profit, after deducting the expense of killing and marketing.

Employes of the Bethlehem Shipbuilding Corporation, of Quincy, Massachusetts, have launched a co-operative bank. Shares are sold for $1 a month. The maturing period is 12 years. A depositor may withdraw his funds at any time by giving 30 days' notice.

The Spokane and Eastern Trust Company is trying the experiment of operating a savings bank without bars or cages above the counters.

A new act regulating the sale and inspection of commercial feeding stuffs has gone into effect in Canada. Under the act bran, shorts and middlings must be free from screenings and the analysis must correspond to a prescribed standard.

The Federation of Farm Bureaus is behind a movement for a national organization of growers of vegetables for canning.

The United States broke all existing records for exports and imports in 1920. Exports totaled $8,228,000,000. Imports were $5,279,000,000.

The public health reports issued by the Public Health Service contain an article on "Diseases Prevalent Among Steel Workers." It may be had upon application by addressing the Washington office of the Service.

Japan has plans for the electrification of government railroads which call for the expenditure of a billion dollars. It is expected that much of the material and equipment will be purchased in the United States.

The Bureau of Mines has issued a report to the effect that gasoline sold this year is similar in quality to that common on the market a year ago. A number of tests, made in various cities, showed no perceptible change in the average.

Fifteen hundred airplane engines of foreign make, acquired by the War Department since 1917, will be advertised for sale in the near future.

The National Merchant Marine Convention, which met recently in Washington, went on record in the following manner: Government aid to companies; the enforcement of provisions of the Merchant Marine Act; the appointment of a permanent shipping board; withdrawal of the government from the shipping industry. It was also urged that government merchant ships be sold to private interests at market prices and the loss charged off to war construction.

Wisconsin and Michigan paper and wood pulp concerns have filed complaints with the Interstate Commerce Commission in which they ask an investigation of railroad rates on paper and paper products.

The branch of the United States Weather Bureau at Helena, Montana, is establishing a station on the summit of the Continental Divide for the purpose of studying air currents. The data will be of use, it is believed, in charting safe courses over the Rockies for airplanes.

Treasury officials declare that the revival of the War Finance Corporation will fail to bring business the aid expected of it.

Grape growers of New York state who expected to be ruined by prohibition have been getting as high as $125 a ton for grapes whereas the average price before the country went dry is said to have been around $25.

Reports from the Middle West are to the effect that banking conditions have improved greatly.

The Pennsylvania Railway has announced that the price will be printed on the face of all its railroad tickets.

The collector of the port at Detroit announces that 352,534 autos took passage on the ferry to Windsor in 1920.

Leaders of the cotton goods trade announce that new prices will be named for percales and ginghams within a few weeks.

The Japanese department of agriculture and commerce estimates the rice crop for this year at about 325,000,000 bushels. This is 12 per cent above the normal yield.

Representatives of the fish and fruit canning industry are urging higher custom duties on competing imports than were ever fixed in the past.

The Interstate Commerce Commission has refused the request made by state commissions and shippers' organizations for a reopening of the case of the consolidation of the express companies.

British steel makers have adopted drastic cuts in prices. Foreign competition is said to be largely responsible.

Reports to leather journals indicate that the shoe factories are resuming work. Rush orders are said to have been received from many retailers.

The Department of Agriculture has announced a modification of European corn borer quarantine. Until June 1, it is said, there are no risks.

Extensive experiments have shown that water glass or lime water are the best preservatives for eggs.

Tobacco men told members of the House Ways and Means Committee that most cigar smokers cannot tell the difference between imported and domestic Havana cigars. They said also that the day of the five-cent cigar will not return.

The American Line and the British Royal Mail Line have entered an agreement with the city of Hamburg for new wharves and buildings. Plans are being made for an extensive traffic between Hamburg and New York.

The Interstate Commerce Commission has approved a government loan of $1,200,000 to the Missouri Pacific Railroad to be used in purchasing equipment. The company will spend in addition $1,800,000.

Briefly Told

The effect of proposed taxation methods in Mexico will tend to break up into small parcels 82 per cent of the arable land in that country which has been held in large estates for three centuries.

The cost of the trip of the American naval balloon, A-5598, from Rockaway to Moose Factory cost the United States Government $3,740.

The health of more than 500,000 citizens in more than a score of cities in Michigan is endangered because of the delay in the construction of waterworks.

To make the north rim of Grand Canyon accessible to tourists, government engineers have worked out a plan to erect a 500-foot suspension bridge across the Colorado River. It is said the north rim, about 1,500 feet higher than the south rim, gives "new and alluring" views of the canyon.

Camp Greene cantonment site will be transformed into a community center.

A new electric serving table has been invented with a heat attachment to keep dishes hot while serving. The table consists of a series of discs fixed upon a removable center, each of the discs being supplied with an electric current which can be turned off or on at will.

The United Kingdom is facing a house shortage of 1,000,000.

On the ground that German industry would suffer if expert dye workers were allowed to leave, the German Government refused passports for two dye experts who were to join the Du Pont Company staff in the United States.

The 1920 export trade of Great Britain gained 61 per cent over 1919 while imports gained by 19 per cent.

A new type of economical explosive absolutely non-freezing has been successfully demonstrated. It will be used in farm construction work, mining and quarrying where cold weather blasting is necessary.

A new radio station in France when complete will easily work with all stations in the world.

Our government hospitals contain more than 20,000 veterans of the late war and that number has been increasing for several months at the rate of about 1,000 a month.

The mucilage on the back of a postage stamp is made from the syrup of sweet potatoes. The liquid is forced through pipes leading to a series of machines consisting of rollers between which sheets of stamps are fed one at a time. The liquid falls in a spray upon the rollers. The sheet with its wet coating of mucilage passes from the rollers into a flue filled with hot air. When it comes out at the other end of the flue the mucilage is dry.

Eight and one-half per cent of all deaths in this country are attributed to heart disease.

A room ten feet long, ten feet wide and ten feet high contains approximately seventy-five pounds of air.

We spend $200,000,000 more for cigarets than for the salaries of all the teachers in the United States.

One of the greatest penalties that can be imposed on a Hindu is that of being outcasted, as it means social ostracism. No man may eat with him and his own relations will not permit him in their homes.

Mushrooms will be grown in the vats of a former brewery in New York.

The Dominion of New Zealand has bought land and houses for its returned soldiers, lent them money for the purchase of farming materials, stock, tools and furniture, provided training for the unskilled and helped in many other ways.

Membership on the Chicago Stock Exchange was sold recently for the lowest in years. The price was $5,000.

Failing to supply sufficient heat for their tenants, two landlords of Chicago were fined $200 and costs.

The Australian natives of the interior wear practically no clothing, though the seasons are extreme compared to that of the coast.

More than ninety per cent of the children of Berlin have rickets.

Combings from collies and other long-haired dogs have been made into yarn and garments. The strength and quality are excellent, fully equal to that of sheep wool yarn, and the texture is soft and durable.

Twenty thousand schools were closed in the United States during the last year because of the shortage of teachers.

The Australian Government plans to cultivate the castor oil plant to provide the Commonwealth requirements amounting to 4,000 tons of beans a year. The Queensland beans contain from 46 to 52 per cent oil.

The value of Alaska's salmon products in one year is seven and a half times the original purchase price of that territory.

According to an estimate of the Bureau of Internal Revenue more than 4,000,000 individual income tax returns are expected to be filed this year.

On January 22, for the first time in the memory of the oldest inhabitant, snow fell in Long Beach, California, a suburb of Los Angeles.

Locked in a hermetically sealed concrete vault for six hours, the assistant city treasurer of Philadelphia communicated with the night watchman by means of the Morse code tapped out with a stick against the walls of the vault. The watchman, familiar with the code, replied, and brought one who knew the combination of the vault.

Sixty-five per cent of the total revenue of the Chilean Government is derived from nitrate export taxes.

A consignment of ostrich skins for shoe leather recently arrived in Boston. It is claimed they will outwear leather footwear and cost less.

Because of the mild weather in Manitoba that province has saved so far $1,000,000 of their winter coal bill.

A fourth of the perishables received at the New York wholesale markets go to the public dumps. A third of the oranges and a fifth of the eggs received are unsalable.

One-third of the country's clothing is made in New York City.

Powerful searchlights will be used in an aerial lightway planned between London and Paris. This will permit commercial use of aircraft by night, making it possible for cargoes to be collected at the end of the business day in London and delivered at the beginning of the business day in Paris.

Certain mills in Rio de Janeiro make a practice of painting the raw coffee bean to suit the requirements of the various buyers. South Africa buys 300,000 bags of bluish green coffee; northern Brazil wishes its coffee black.

Tropical balsam wood is coming into use as a substitute for cork in some capacities.

Chinese eggs are selling in Minneapolis at 52 cents per dozen. Half a million arrived without one egg being broken in transit.

Financial agencies report that 84 per cent of all 1920 failures were firms which failed to advertise.

The passage of the migratory bird law has resulted in a saving of $20,000,000 in food to the United States, according to the Department of Agriculture.

A contrivance to pump fish from a purse net to the hold of a fishing vessel has been invented. The fish are pumped through a large rubber tube to the deck of the vessel and discharged upon an inclined plane of wire mesh from which they slide into the hold, the water running through the mesh and into the sea.

By use of high pressure water has been converted into a new ice so dense and heavy that it sinks in water instead of floating.

Lincoln, the Man

IT WAS the human side of Abraham Lincoln, as best portrayed in his everyday life, which endeared him so strongly to the great mass of the people. He was one of them, with the same desires and ambitions, sorrows and perplexities, which beset the average man and woman. He knew from bitter experience the difficulties encountered in the fight against poverty and discouragement. He was never too busy nor too much occupied with the cares of the nation, to lend a helping hand or speak an encouraging word when the occasion presented itself. His simplicity of character was exemplified by his rules for living, which a writer has given as:

"Do not worry, eat three square meals a day, say your prayers, be courteous to your creditors, keep your digestion good, steer clear of biliousness, exercise, go slow and go easy. There may be other things that your special case requires to make you happy, but, my friend, these I reckon will give you a good lift."

It was not the office that made Lincoln great. It was not the fact that several millions of his countrymen chose him to be their leader, and placed him in the presidential chair which gives luster to his character. The qualities which caused him to be acclaimed the leader, he possessed when he was teaching school, and splitting rails, and reading law in a judge's musty office. From the beginning he was a man among men who always upheld the right, advocated justice for the oppressed, and a square deal for all.

It was Lincoln the Man, and not Lincoln the Commander-in-Chief of the Army, who would spend hours, which should have been devoted to sleep, going over the records of a court-martial of a boy who had been found asleep at his post, hoping that he might find some extenuating circumstances which would palliate, in a measure, the boy's offense. It was Lincoln the Man who would take his pen and write across the record, "Pardoned," and give that boy back to his mother, feeling in his great heart that a higher justice had been served.

It was Lincoln the Man, of whom the story is told that once while driving through the woods, he stopped the carriage, and himself picked up a nest which had fallen from a tree and replaced it with its nestlings in the crotch of the limb.

"If I had not put the nest back," he said, "I would not have slept that night, thinking of the mother bird; because I know how I would have felt if such a thing had happened to my own children."

It was Lincoln the Man, rather than Lincoln the Statesman, who signed the Proclamation of Emancipation, thereby freeing a million of his fellow beings from the shackles which had bound them, body and soul.

It was the Man Lincoln who, looking down the years with his keen vision, could see the day, far distant, but surely coming, when there would again be no North or South, but one united country, and uttered as a prayer the words of his Gettysburg address, which ended with the appeal:

"It is rather for us that we be here dedicated to the great task remaining before us, that from these honored dead we take increased devotion to that cause for which they gave the last full measure of devotion; that we here highly resolve that these dead shall not have died in vain; that this nation, under God, shall have a new birth of freedom; and that government of the people, by the people, for the people, shall not perish from the earth." —Frank Dorrance Hopley.

EDITORIALS BRIEFLY TOLD
MANY MEN OF MANY MINDS
THREE ARTS ILLUSTRATIONS

Many Men of Many Minds

St. John Ervine.—In figure, in speech, in thought, in habit, in gesture, and in look Abraham Lincoln was an American. One might say that he was the greatest work of art that his country has yet produced.

Ethel M. Smith.—Large armaments mean militarism, and militarism means tryanny as well as economic waste. It is the wage earner always who has the most to lose in war and under a militarized government. We want militarism and all its works to go.

Gifford Pinchot.—The destruction of our timber, and of the timber-producing power of lands valuable for no other purpose, would be far less serious than it is if there were other portions of the world from which the absolutely essential lumber supply for our agriculture and industries could be obtained. The story is the same throughout the world. Africa, Australia, Russia, Siberia, the Philippines, and the islands of the sea offer us small relief.

William McClellan.—The peculiar faith of the American in the future of his country has been a controlling factor. This faith has been backed by unlimited investment of time, energy and money. Men have been willing to invest and to keep on investing in situations where other types of minds would have been discouraged quickly. Railroads were thrown from one ocean to the other, over wide stretches of totally unoccupied country and scaling two mountain ranges purely on faith in national growth.

Kenneth MacGowan.—The presence of a great mass of commercial and artistic ignorance at the point where the public must register its taste, has many curious effects on the sort of film entertainment made and most profitably sold in America.

Philander P. Claxton.—We have got to pay more for our teachers in the future—more than teachers in the public schools have ever been paid in the past. Temporary increases in pay to meet the increased cost of living will not do. We must put teachers' wages on a new basis and give such a guaranty of continued good wages in the years to come as will induce young men and women to accept teaching as a permanent profession and take the time and spend the money necessary to prepare for it as a life business.

Must Put Wages of Teachers on a New Basis

John D. W. Bodfish.—The manhood and womanhood of America is being tested today as it never was before. Our form of government is in danger, not so much from foes without as from conditions within our own borders.

Ellis W. Shuler.—To raise the level of the Yellowstone Lake six feet will make a profound change in its topography. Many interesting points about the lake, such as Breeze Point, Sand Point, Stevenson Island, Dot Island, Gull Point, would be forever blotted out of sight.

Henry L. Stimson.—There should be more liberal treatment of the men who are undergoing vocational training in an attempt to make themselves self-supporting. There has been much stupid red tape thrown about the present system, with the result that men who require such training and are anxious to take it have not been afforded the necessary financial support while undergoing it and have thus been obliged to give it up.

Andre Tardieu.—At the present time France has no wishes or ambitions as far as new colonies are concerned. Her entire policy is, and will remain a policy of development.

Philip Cabot.—The modern industrial system on which the great populations in Europe and in America live is not a hundred years old yet, and it is entirely dependent on quick, cheap railroad transportation. Quantity production, America's particular specialty, depends on good railroad service. Otherwise it is impossible to gather materials from every part of the country at one point, make an article, and then send it to every part of the country again.

Franklin H. Gidding.—Deliberate attack upon Anglo-American friendship is criminal, and men who lend themselves to that business need expect nothing but unsparing condemnation from those who sincerely desire world peace and understand the conditions upon which it depends.

Warren G. Harding.—I am sure the incoming administration wishes to see, figuratively speaking, every southern port whitened by the sails of commerce and know that our carriers are taking messages of good will and amity along with our cargoes to all the marts of the earth.

Captain Thomas Shrader.—A person who has little skill in bartering never should attempt to trade with Eskimos. Trading in the Arctic requires not only a larger stock of merchandise and less money than anywhere else I have ever been, but it requires more patience, skill, tact and understanding of the native methods and desires. Colored cloths, so popular in warmer countries, are of no value to the Eskimos, and they do not care for them except in the form of woolen socks and stockings, which they buy as rapidly as they can get them, since the great difficulty these natives have in their long, cold winters is in keeping the feet warm.

Eskimo Gets Cold Feet; Likes Wool Socks

Thomas C. Martin.—Mexico's production of foodstuffs this year from the soil will be at least twice as large as it ever has been in any one year in her previous history.

Frederick A. Wallis.—It is in the city where Bolshevism and I. W. W.'ism fan the fires of discontent. It is in the city where settle and fester the dregs of European immigration, which become a hotbed of sedition and murder. It is in the city where organized graft and gambling and "hold-up men" trampled law underfoot and laugh at constituted authority. The middle of the road in the middle of the day has no terror for them. It is in the city where our criminal classes are recruited, and it is in our city where crime reaps her richest harvest.

George Pattullo.—Never in its history did the Continent stand in such dire need of cooperation as during the past two years, yet never were the nations so sharply divided by conflict of interests, by hates new and old. In war they were ranged in two camps; in peace they fell apart into a dozen.

Meredith Nicholson.—Nothing in the divine order is cast as rubbish to the void. We strive, win or lose, and, losing, find ourselves richer for the discipline of defeat. It is no sin to fail; the sin is not trying.

Francis Edward Clark.—As we read the signs on Broadway, and see that the Cohens and the Solomon Levis have crowed out Smith, Brown, and Jones, we ask ourselves, "Is America to become a commercial Jewry, instead of a New Jerusalem let down out of heaven?"

Floyd W. Parsons.—In the past the United States has paid small attention to the development of the metal resources of other nations. In future years we must not only take careful stock of our own supplies, but we must closely follow the exploitation of the mineral deposits of all the other countries in the world. The United States is the last of all the leading nations to comprehend the vital political significance of the commercial domination of the earth's mineral wealth. Already our slowness in grasping the importance of this matter has permitted other nations to take action that is even now affecting the international trade interests of the United States.

Should Not Neglect Metal Resources of Other Nations

Arthur D. Little.—With more than half of the world's coal reserves within the area of the United States, we have permitted a situation to develop which has involved shortage at the mines, with the miners on strike or "on vacation," famine at consuming points, embargoes, priority rulings, and the complexities and inhibitions of fuel administration by the state.

F. W. Wilson.—We have lost sight of President Wilson's idealism in our laughter at his failure when matched by the tough, tried politicians of Europe. His idealism in the hands of General Smuts and Lord Robert Cecil could have become a practical means of helping to save Europe if we had not drifted into this present materialism, and had recognized that the true soul of a nation is not the balance between exports and imports.

Charles D. Williams.—America needs a few fearless leaders to tell its citizens the truth. Business is afraid of the truth. The only citadels of honor left are the pulpit and the teacher's chair, and they are shaking in their foundations.

Thomas W. Lamont.—We are apt, because the military party is powerful, to criticize the Japanese as being a militaristic nation, whereas, in my judgment, they are a nation loving peace and ardently desirous of peace with the United States.

K. K. Kawakami.—If California is only disposed to apply reason and wisdom to the Japanese question, its solution ought not to be difficult. For Japan is but anxious to dispose of the question if she can only do so without jeopardizing the dignity and honor in which the powers have by common consent clothed her.

Herbert Hoover.—I have seen long lines of children who never played and seemingly had forgotten how to smile. It is to them that we would reach out this winter the supreme friendship of food and medical aid.

Sanford Griffith.—Both employers and workers in Germany, at bottom, are convinced that the only immediate hope for twenty million German people is to maintain and increase production.

Edward Hungerford.—The railroad today is getting the square deal; a generous one, according to a good many folks. It ought to be broadminded enough, scientific enough, progressive enough to work out a plan for the differentiation of its service upon modern lines. For the arrogant traveler who not only demands the best, but demands also that he be permitted to talk about it afterward, supercharges and supersupercharges, too, if you wish. But for the patron of modest means—and there are some of that sort still left in this broad country, to whom travel is as much a genuine necessity as any sort of luxury—a scale of charges and service suited to his or her modest necessities.

Railroads Getting Square Deal, Says Hungerford

Sidney L. Gulick.—The permanent success of our democracy depends closely on the admittance of only so many and such aliens as will in due time become truly Americanized. We must, moreover, admit even them only in proportion to our capacity to employ them without endangering American standards of living and labor.

Eugene S. Bagger.—Complete mastery of English by a non-English-born person is a very great rarity. The foreigner may write English accurately and even with force; he will seldom write it inspiredly.

George W. Alger.—At the very root of democracy lies the great principle of equality before the Law.

L. P. Edwards.—The "Americanization" of the foreigner can be wisely and safely accomplished only if spread out over at least three generations, while four or five would be better.

Francis H. Sisson.—Leadership that will direct our national thought into logical channels is imperatively demanded. And it will be the duty not only of the incoming administration but also of Congress to assume that leadership.

James L. Garvin.—The modern world never was so much out of joint, and never were so many Hamlets cursing the spite of their times. Let them spare themselves, for it is not their type that was born to put things right. That task will be achieved not by brooding speculation but by plainness and vigor of practical effort.

Briand, Premier Seven Times, T. R. of France

By PAUL TYNER

THE "come-back" of Aristide Briand, now Premier of France for the seventh time, is an event full of meaning for the future of France and of the world. It plainly demonstrates the failure of Millerand's scheme to retain real power by making a political nonentity the nominal premier, when he himself exchanged the Premiership for the Presidency a few short months ago. Briand's choice is equally convincing demonstration of the break-up of the "National Bloc"—the coalition of parties on which Clemenceau triumphantly rode back into power in November, 1919. Composed as it was of essentially conflicting elements, Royalists and Republicans, Clericals and Socialists, reactionaries and radicals, it was of doubtful permanency from the first. It lacked any real coherence or solidarity in conviction and policy. Even as to the trumpeted common interest in opposition to "Bolshevism," as a basis of unity there was much make-believe, and thinly hidden mutual distrust. The more or less flaming jingoism, built upon surviving passions of the war, plainly lacked cohesive qualities as a cement.

But the chief significance of Briand's return to power is its demonstration of the depth and genuineness of his countrymen's appreciation of his outstanding greatness of character. He is, by common consent, the most brilliant of living French statesmen in debate and the Republic's ablest administrator. Briand, indeed, bears more than a surface resemblance to our own Roosevelt. He has the same virile "fighting face" and the same forcefulness and directness of speech. The two men are much alike in rock-ribbed honesty and practical idealism. Roosevelt's sterling Americanism is paralleled by the French premier's sturdy and unflagging devotion to the true glory of France. And finally, Briand, like Roosevelt, is a forward-looking man, a true *Progressive*. The differences between the American and the French leaders are such as may be largely accounted for by the differences between the Latin and the Anglo-Dutch temperaments. Although more dramatic in action than his American congener Briand gives one the impression of more restraint and deeper reserve of power. The funny little squeak in Roosevelt's voice when he got excited and which with other mannerisms he was clever enough to make effective—is never heard in the full, even tones of Briand's voice. The more intense and excited he becomes, the quieter and more restrained is he in voice and manner. If there is any of the rash impetuosity of Roosevelt in Briand's make-up, he controls it marvelously. He never loses his head and never slops over. There is probably no better balanced man in public life on either side of the Atlantic unless it is perhaps the Italian premier, Signor Giolitti.

M. A. BRIAND

I shall never forget the occasion of his actual comeback in the Chamber of Deputies on March 21, 1919, when he caused such a sensation by his re-entry on the political scene just two years to a day after surrendering the premiership. During the interval he had practically effaced himself from the stage of political activity, never mounting the tribune although the most eloquent orator in the Chamber of Deputies. He contented himself with yeoman's service in support of the government's war effort in his place as deputy for Saint-Étienne, which constituency he represented for sixteen years, rendering especially valuable service as chairman of the committee on foreign relations. The debate was on the electoral reform bill—a subject on which Briand was thoroughly informed and which he had much at heart. Seldom have I listened to a more moving speech, eloquent in phrasing and delivery, logically clinching and profoundly impressive. In a voice by turns warmly caressing and almost brutally compelling in its challenge, he declared that the old *scrutin d'arrondissement* had outlived its usefulness and that the day had arrived for the *scrutin de liste*, the *scrutin de justice*, if the country was to go forward and not sink supinely into the slough of despond. In the public life of the country, he continued, great ideas broke themselves against the walls of the petty districts in which the deputy began and ended by attending to his own little affairs, each one managing his own local fight. It was natural under the circumstances that a man should turn for support to local interests having a respectability of their own and local ambitions that were entirely legitimate so far as they did not impinge on the larger interests of the nation. Without this reform, the country could not fulfill its destinies.

For months the government had been playing hide and seek with the measure and at that very moment was endeavoring to stifle it in a senate committee. Driven into a corner, Clemenceau, who was present, was forced to concede that the law would be put into application at the next elections. This was actually done in November, although the measure as finally put through was hobbled by a species of gerrymandering in the matter of the method of proportional representation laid down.

During Briand's speech, I watched his face closely, at the same time noting its effect on the assembly which crowded the chamber to the doors. He spoke for about three-quarters of an hour and was listened to with a concentrated attention in the midst of a religious silence, unbroken save when the deputies broke into bursts of uncontrollable applause. It was testimony to the depth of the impression made by Briand's eloquence that on the conclusion of his speech the discussion was immediately closed—although his opponents were in the majority.

Following this dramatic return to the political stage, it was very generally expected that Briand would be Clemenceau's successor in the premiership, no matter how the elections went. The "Tiger" had already signified his intention to retire and it seemed very probable that he would win the dignified crowning of his career by an election to the presidency of the republic. Jealous of Briand, however, he took care to block his accession to power at that time by having his friend and henchman, Millerand, made premier. Briand waited. He knew he could bide his time, letting subside the glamour of Clemenceau's popularity as the "Father of Victory" and the noise and dust it stirred up. Through it all his friends knew, and many of his enemies knew, that it was really to the wisdom and the efficacy of Briand's direction of affairs during the two most critical years of the war that victory was made possible. One of these friends cleverly declared that Clemenceau was like one of the servants hired at the eleventh hour who received the same wages from the Master of the Vineyard as those who had labored through the heat and burden of the day, as related in the Bible parable—except that in this case the eleventh-hour servant was given an even larger wage than that paid to the man who had done the spadework by which France had so richly profited.

The story is told that, a few days before the signing of the armistice, M. Briand was dining with several British "high personages," one of whom eulogized the marvelous courage which France had shown in the war and the immortal glory which she had gained.

"Yes, dear friend," responded M. Briand, "France has always loved the laurels. But, since 1870, her cooks have learned that laurel is excellent in the sauce. Today, having culled such admirable laurels, she will see to it that the sauce is not lacking."

"Are you quite sure?" asked the distinguished Briton smiling.

And the average Frenchman will comment on this story with a sigh: "Alas! that Briton knew what he was talking about. France has not made a good sauce with its laurels. Even as France failed properly to prepare for the war during the peace, she failed to prepare for the peace during the war."

This certainly was not the fault of Briand. When in office, he well understood the dangers of the situation created by the fact that the Allies, having divergent and often opposed interests and which made it necessary that they should arrive at a common understanding in order that they should not find themselves in disaccord at the moment when Germany would be obliged to capitulate. This was why he arranged with England the question of the Cameroons and of Asia Minor, on which two points France profited during the peace negotiations. He sent M. Doumergue to Russia to obtain *carte blanche* on the Rhine, and, in the month which preceded his fall, he charged M. Paul Cambon, French ambassador in London, to bring about a similar understanding with England for the settlement of the question of the left bank of the Rhine in consonance with French interests. More than this M. Briand instituted three great parliamentary commissions charged with the study of this essential question. The first, presided over by Senator Morel, an especially competent man for the task, was to investigate the financial consequences of a neutralization of the Rhine provinces. The second occupied itself with problems relating to mines and industry, and the third was to take up the study of the rights of France in the Rhenish territories from the historical point of view. As to the labors of M. Paul Cambon, they were not followed up by any of Briand's three successors, MM. Ribot, Painlévé and Clemenceau. Consequently, France lost the advantage of having in her hands a prior engagement on the part of Britain when the Allied and associated powers came to sit down at the peace table. The three commissions continued their labors after the fall of Briand and had furnished to the government reports of the highest importance; but it seemed as if the delegates at the Peace Conference had not at all taken them into account and Mr. Wilson was not even acquainted with the fact of their existence. It is believed by Briand's friends that, but for this neglect, France and the world would have been spared the seven months' long-drawn-out discussions at the Peace Conference and that we would, the world over, be by this time far on the way to re-established economic conditions. As it was, he had secured Britain's signature to an agreement defining in advance the French zone of influence in Asiatic Turkey. In this zone was included Mosul, because it was considered that great economic interests must be taken into account, and in the Mosul area there are important oil springs. In Cilicia, also, the question of cotton growing was deemed an essential factor in the territorial settlement. This was revealed by Briand in a statement in the chamber on March 28 last in the course of a debate on territorial questions, during which he made the striking statement that the future belongs to the nation which controls the world's oil supply.

Perhaps the greatest speech of M. Briand's entire career was that made by him on June 25 last, when, intervening in a discussion of the budget for foreign affairs, he delivered a most telling criticism of the Peace Treaty and of the surrender by Clemenceau of all the advantages that had been gained for France by the agreements of 1916. "What a terrific indictment of Clemenceau!" exclaimed one of the deputies at the conclusion of Briand's speech. But when one came to read it next day in the official report, it was noted that he had not even mentioned Clemenceau's name.

He was returned to the chamber for his native city of Nantes at last November's election and has loyally sustained the government of M. Millerand whenever he could do so conscientiously, not failing to express admiration for Millerand's "ability" on the one hand, nor to criticize him frankly on the other. On the question on which M. Leygue's ministry was overthrown, that is, failure to acquaint the chamber with the facts concerning recent negotiations with Britain, it is certain the new premier will insist on taking the country into fullest confidence. What is more, his important part in previous negotiations with Britain will aid him in maintaining a firm attitude.

Remembering that Briand was the first Socialist premier of France, there may be some inquietude in the minds of Americans unacquainted with the complexities of French political parties. For the benefit of such, it may be said that in France a Socialist is not necessarily a revolutionist, nor even an extremist. Briand, like Millerand, is a Socialist of the Right-Center. His party plays the important rôle of balance-wheel between the extreme of royalist reaction on the one hand and that of Socialism of the extreme Left tending to Sovietism on the other. The illuminating fact is that he has won out although regarded as "fallen outside the breastworks" by all parties. He resumes the helm as spokesman of the sober second thought of France, of the will to discard partisan squabbling and get to work in earnest on the great and arduous task of national reconstruction. He realizes, as he put it in his electoral address last November, that in order that France shall be able to function properly and pay her debts, the coffers of the individuals must be opened, not with crowbars, but with arguments of justice and social solidarity. As for those deaf to such arguments, he promised that the law should see to them.

The unhorsing of Leygues and of his master, Millerand, means also the unhorsing of British influence in French affairs—and of the invisible influence back of Lloyd George to that extent.

To Briand, the socialization of government and industry must be an evolutionary rather than a revolutionary process. His socialism may be regarded, indeed, as the very antithesis of the Bolshevism of Lenin and Trotsky, Longuet and George Lansbury. In the elections of November, 1919, Briand went before his constituents at Nantes on a platform declaring that the first duty of the French people was to re-establish the financial situation of the country and to so organize its economic resources as to enable them to realize the fruits of the victory and to assure to France a rôle in the world equal to its prestige. For this, he went on, the splendid national solidarity realized by Frenchmen during the war should not be broken by the peace, especially as they still waited for guaranties of good faith from the enemies of yesterday. But union should not spell confusion and the country must send to the new parliament men with an ideal and a program, for the young republics born of the war, waited impatiently for France, faithful to her traditions, to light their way by orienting the republic toward a future of social progress, realized in order and legality, and assuring to all security of person and of property. He declared himself a champion of liberty of political opinion and said he wished to see maintained the work of the republic based on neutrality in matters of religious belief. To fight the high cost of living, there must be fullest production and freedom of commerce. That the exhausted treasury of the state might be replenished, reforms were necessary to the proper functioning of the social mechanism. In the domain of the relations between capital and labor, it would be necessary to assure to capital "conditions of stability and security," and to the workers "the benefits of wages corresponding to the profits of the enterprise." His program stressed the question of finance which is even more pressing now than it was at that time. Fiscal reforms were outlined entailing a gradual reduction in the enormous volume of paper money, which is in large degree responsible for high prices and for the alarming depreciation of the franc in foreign exchange. In regard to the question of armaments, M. Briand went on record as declaring that its solution would be found in the prior complete disarmament of Germany which would alone make it safe for her late enemies to disarm.

The new premier's declaration of his policy and program soon to be presented to the chambers will probably be found to conform closely to this outline of his views a year ago. He declined at that time to join Clemenceau's national bloc.

In his triumphant "come-back," it seems certain that he will rally the best elements in the nation to his support in steadily pursuing a program of genuinely constructive and progressive reform, of which the country is sadly in need.

The Poison Gas Tax

BEFORE the war, it was the fashion to satirize a particular class, and that not a very large one, as pre-eminently "the spenders." The picture was far from a lovely one. The spenders were wastrels on a large scale, people who lavished money on stupid luxury and ostentatious display. They were characterized by thoughtlessness, materialism and lack of any larger ideas or ideals than those of selfish indulgence and competition in snobbery. They were the "social climbers," and the moral of their mistake was often pointed by the proverbial and logical devolution of waste into want, or by a progressive hardening of heart in regard to the weal or woe of the producing class upon whom the spenders were parasites.

Since the war, we seem almost to have developed into a nation of spenders. In a very large degree, people in every walk of life are suffering today because they flung to the winds in reckless expenditure the gains harvested in the fat years of brisk business, big profits and high wages, so coming unprovided to the lean years of diminished buying, unemployment and lowered wages. In the matter of governmental expenditures, the degeneration into spending of the vicious sort that involves prodigal and prodigious waste seems to have taken a stranglehold on those in control of the national purse strings. We piously denounce the "militarism" of European countries, and then go ahead and vote for military and naval purposes several times our pre-war scale of expenditure. The people are suffering for lack of housing caused by the shortage following several years' embargo on building during the war; but the money that might be put into the provision of this prime necessity is diverted into the foolish luxuries of big fleets and armies, the multiplication of government departments and government employes, just as on the private side, material and labor are thrown into the building of motion picture theaters, or the production of million dollar "spectacles," on such a scale that neither material nor labor are left for homes or schools or for decent salaries for teachers.

"Uncle Sam is rich!" was a phrase often heard during the war at Washington and elsewhere in justification of what ordinarily would be deemed rank extravagance. And it is possible that Congress but reflects a national sentiment. We are temperamentally a free-handed folk, spurning to be thought over-regardful of the pennies, or even of the dollars. Franklin has in large measure ceased to be our patron saint, or thrift our cardinal virtue. Especially do we disdain to be thought "pikers" when it comes to spending other people's money—the public money. In flinging away money on government expenditures we act as if the United States Treasury was a sort of inexhaustible Fortunatus purse. "This is a billion dollar country!" declared the late Speaker Tom Reed when his party was criticized as that of the first "billion dollar Congress." Today we are spending multiplied billions and when any criticism is heard there seems to be no other thought than that of endlessly piling up the burden of taxes on the people, or of the issuing of loan upon loan which only means deferred taxes with additions for interest. And the taxpayers grin and bear it.

How would we feel if instead of paying this ever-increasing tribute under camouflaged descriptive terms that relate it to its source, we were to confront a tax demand named with reference to its destination? What if we were called upon to go down into our jeans and hand over our hard-earned money as "Poison Gas Tax," for instance; or battleship tax, or submarine tax, or congressional junketing tax, or big gun tax, or seed-distributing tax, or farm betterment tax, or good roads tax, or high-prices-for-home-consumers tax? Is it not possible that we would be awakened into a new sense of responsibility? A national budget, of course; but a national budget is not enough. Let every taxpayer have the truth brought home to him as to just what proportion of his good money his stewards propose to spend on wasteful in comparison with useful and profitable objects.

Olive Schreiner

THE recent passing of that very brave and very able woman, Olive Schreiner, calls attention anew and sharply to the book that a quarter of a century ago established her literary reputation and took its place among the few immortal works that were not born to die. "Dreams" is much more than a literary masterpiece, as its author was much more than a writer. As daringly original in both thought and matter as was Walt Whitman's "Leaves of Grass," its tremendous fascination and profound impressiveness were due not so much to its style as to the fact that the style in this instance was in very truth the woman. Simplicity itself, her phrasing, in all its subtle distillation of the finer possibilities of word-welding, was but the entirely natural clothing of really great thought. "Dreams" is the great message of a great soul. In its lightning-like flashes social shams are rebuked by implications that have all the force of finality; but Olive Schreiner's thought is forever positive and constructive. She deals in affirmations rather than negations and always with a fine candor and persuasiveness that stirs the reader to the depths of his being, impelling him to higher and larger purpose in life with clearer understanding of its deeper meanings.

Warmly and intimately human, the book is almost primitive in its compulsion on the reader to face the realities of life in forcing him to face God and his own soul in the dispersion of clouds of doubt and re-establishment of life on the sound and permanent basis of things as they are in eternal reality.

Quite incidentally to her humanness, Olive Schreiner was a great feminist and in the course of her earlier life she contributed telling service to the cause of woman's industrial and political emancipation. We think of her for the most part as prose poet and romancer, remembering "Dreams" and the remarkable novel in which she so strikingly pictured South Africa and South African life and character, "The Story of an African Farm," but in her London years she was one of the little band of Fabians, that did so much for the triumph of progressive ideas in London's County Council, worked with Sidney and Beatrice Webb in their arduous and invaluable labors of social research and gained an intimate knowledge of actual conditions among the poor and among the workers. Her friends feel that the blow inflicted by the war and the rebellion in South Africa probably hastened her end. There is a legend that Cecil Rhodes once asked her to marry him and that for love of her he went unwedded to his grave. Certain it is that with all her respect for his better qualities, she could have had little sympathy with the great "Empire Builder's" imperialistic notions and years afterward she married a member of the South African parliament. The attitude of women to the war was a great disappointment to her. She once said to R. L. Southwaite: "It is a reversion to savagery. The primitive woman was attracted by the man with the most scalps in his belt—so today."

The Curious Naval Mind

TO THE average citizen, who foots the bills and who is called on to do the fighting and the dying when his country is threatened, the refusal of the Navy General Board to consider a naval holiday or even to approve of a delay of six months in order to give experts time to determine the lessons of the late war, seems folly indeed.

Great Britain may cease the building of dreadnoughts, it appears, but not the United States. Britain, say the pleaders for a great navy, has ceased building because of economic conditions. This is pure and unadulterated bunk. Anyone who has any acquaintance whatever with naval history knows that if the leaders of Great Britain deemed it essential for the safety of the empire to continue building great and costly warships the money would be forthcoming.

The attitude of the board is the attitude of men who make a business of preparing for war. They want all the armament they can get. If they were about to officiate at a duel they would probably clamor for ten pistols for each principal instead of one.

The Whisperers

IF THE word of the Department of Labor is taken, 3,500,000 people normally employed in the industries of the United States are out of work, while if the statement of the American Federation of Labor is accepted the number is close to 8,000,000. It is probable that the government's statistics are nearer the mark than those of the federation, for the government has the organization for collecting data of this kind and needs to do less generalizing in achieving its totals.

And while the idleness of 3,500,000 men is no light matter and is not to be passed over as a trivial thing, it does not constitute as serious a situation as the "whisperers" would like to have us believe.

"Whisperers," it may be explained, are a species of the human race which delights in spreading dark and foreboding news. The tools of their profession are a knowing look, an air of possessing a great deal more information than they are privileged to tell and a voice which drops easily to a confidential undertone. They thrive because, as someone has said, "a lie can travel around the earth while truth is putting on its boots," and because of the inclination of the human race to believe bad reports. They "have it on good authority" that conditions are going to be worse before they are better, or they repeat ordinary reports, which have been given full publicity in the press, in a manner which shrouds them with gloomy and dreadful portentiousness.

The facts, as one can ascertain by even a casual reading of the daily newspapers and of the business reviews, is that the situation is improving daily. Another truth, and one of which we think too little, is that the nation's business has met one of the greatest trials of its history and has come through in a wonderful fashion. No greater proof of the solidarity of business could be asked, or given, than the fact that we have emerged from such a critical period in our financial history without a panic and without breadlines or soup-houses being a common sight in the cities. There is want and suffering, of course, but no such misery as the present generation has witnessed on more than one occasion within the relatively recent past.

The next time a "whisperer" begins to breathe heavily into your face try telling him these things out loud and watch him collapse.

The Matter of Mandates

WE ARE reminded in a recent article by former President Poincaré in the *Revue des Deux Mondes* that all mandates under the League Covenant are not the same. There are three distinct classes of mandates, and they should not be confounded. Of course, the man in the street has not bothered his head to draw fine distinctions in this matter. "Mandate" has come to mean to most people merely a cynical euphemism for annexation.

The learned French statesman seeks to correct this popular way of looking at the matter, in so far as France is concerned. "We are in the Levant," he says, "neither to annex territory nor to install our protectorate. We are there in virtue of a mandate which, in accordance with the Treaty of Versailles, we have received from the League of Nations. This is simply a matter of form, it may be said, and in reality we are there to make ourselves masters of that region of the earth. Not at all. In execution of Article 22 of the pact, the Council of the League has created three types of mandates, which are designated by the first three letters of the alphabet. Category A, under which come our mandates for Syria and for Lebanon and the British mandates in Palestine and in Mesopotamia, includes those states which are to remain independent and to which the mandatory powers are simply to lend their assistance. We have not, then, in Asia Minor even the rights, granted under Category B, of administration, under certain conditions, by the mandatory power, much less those coming under Category C designating the countries to be administered as an integral part of the territory of the mandatory power. We are simply and solely auxiliaries and counselors of civilized peoples called, in large measure, to govern themselves. It is because both Christians and Moslems have so understood the matter that they have welcomed our soldiers as liberators."

As to just how strictly either France or Britain is adhering to this limitation of the authority under which they are with force and arms in Syria, Lebanon, Palestine and Mesopotamia, it is very possible that King Emir Feisul, of Damascus, and the Arabs whom Britain is bombing from the air in Mesopotamia like the Moslems who object to Sir Herbert Samuel's rule in Palestine, may not entirely agree with M. Poincaré. The man in the street has not always M. Poincaré's legalistic mind.

Mr. Ford's Page

TIMES of piping prosperity are often bad for business. Strange as it may sound, this statement will appear very plain and true upon a little consideration. We may say what we please about the business conditions which have hit the country during the last two months, but the real damage was done when everybody said that everything was lovely and the goose hung high.

By the same token, this period of depression through which we have been going has been good for business. The best thing that could have happened—it did not happen too soon. Business is on a better basis today than it was three months ago; it will be on a better basis next month than it would have been had not a halt been called.

These are simple ideas, but they are worth turning over.

You can see the good effects of poor business by just looking at the stores, the corner stores and the big downtown concerns. It was not long ago that the ordinary frugal buyer was somewhat in contempt. Clerks caught the contagion of the profiteers, and it was "Buy it or leave it" almost wherever you went. The morale of salespeople slumped at a terrific rate, and that is a pretty serious thing for business.

Not so very long ago the coal merchant sat in his office with the air of a king dispensing favors. His attitude in many cases was, "I don't know whether I will sell you or not—I'll think it over." It was bad for him and for his customers. When any business man in any line of business becomes independent of the public, or even thinks he is, it is a calamity for his business.

In some industries all that has remained for salesmen and managers to do during the last few years has been to take orders and deposits, and adopt that air of, "We may let you have it in about six months—if you deposit enough now." Orders came without effort. Customers were doing all the clamoring and worrying. Whereas once it was the customer who favored the merchant by dealing with him, conditions changed until it was the merchant who favored the customer by selling to him.

Now all that is bad for business. Monopoly is bad for business. Profiteering is bad for business. The lack of necessity to hustle is bad for business. Business is never so good and sound and healthy as when, like a chicken, it must do a certain amount of scratching for what it gets.

Things were coming too easily. There was a let-down of the principle that an honest relation ought to obtain between values and prices. The public no longer had to be "catered to." There was even a "public be damned" attitude in many places.

It was intensely bad for business, all that kind of prosperity.

> ***TOO long a stretch of good business is bad for business. A period of depression and slackness, such as the country has been having, is really good for business. Trade can come too easily. The habit of sitting in an office and filling orders and counting money is the worst one that can be fastened on a business man. He ought to have just enough difficulty to make him dig. Orders have been coming so fast in America that we have forgotten how to get out and sell. Flabby and soft organizations did not know how to meet the changed conditions of the past three months. Now, everybody must get out and hustle, and that is one of the best things that has occurred in the United States since 1914.***

But there has come a change. The era of rampant prosperity so-called died down. The reckoning-up time came. Customers no longer besieged the doors. Indeed, customers have a memory and they remembered that in the heyday of trade they were treated rather cavalierly. Many merchants are discovering today that he was a wise man who was just as anxious to serve and please his customers when trade was brisk, as he is now when trade is a little slower.

The best point of all is that this period of slackness is showing up the damage which false prosperity did to business ethics and efficiency. A good business is one that can sail along comfortably in the face of adverse gales. Since 1914 almost any fool could do business. There was more business to be done than there were business devices with which to do it.

It will be generally conceded that the period of so-called prosperity had a very deleterious effect on salesmanship. Salesmanship is more than taking orders; but that is about all it has amounted to during the last six or seven years.

When the rush of prosperity began to dwindle and then to cease, and it became necessary to pull in the collar rather than hold back in the breeching, then was the test. It was found in many cases that salesmanship had softened. The easy-chair and order-taking habit had demoralized it. It could not stand for the rough, hard work of going out and being refused, and being refused again.

So, it has been a blessing for business all round, this period of depression; it has shown up the flabby spots. It has disclosed those people who were content comfortably to watch the wheels go round, but were not very handy in getting out and making the wheels go round.

We were getting to a place where no one cared about costs except the consumer—and he didn't count. Not only did no one make a move toward reduction of costs, they actually dreaded to think of the time when it would have to come. Business lay abed, like a boy who hates to get up and go into the cold barn to do the chores. Business was soft with too much good living.

Nothing has happened in our history to render out of date the business philosophy of Benjamin Franklin. Poor Richard's Almanac is still the best business compendium The old American virtues of thrift and industry have no successors or substitutes. Business success is still a matter of making friends by *service*, and not a case of cornering necessitous people in such a way that they will have to come to you.

Free trade still exists in the local sense. Trade will always remain free regardless of monopoly or combine. Trade gravitates toward the man who has the desire and the will to please and serve those who need what he can give. When a man gets bigger than his business, when he begins to think that he has got things coming his way and therefore may relax, he is in a bad state.

Every successful business is troubled with that sort of disease—complete satisfaction and relaxation. It should be ruthlessly exterminated. If this disease strikes the principal leader of the business, he should retire or be removed as quickly as anyone else would be. That kind of success is very bad for business.

Young men have been asking for a number of years whether there was any possible chance for them to start for themselves in a world which is apparently so completely organized. Sometimes the answers were encouraging, sometimes not.

But now they can see for themselves. It is any man's game now who will play it according to the old-time rule of "value received." A business man is a servant, and when he gets too rich, or too high and mighty for that, then something happens, and someone else gets a chance. And that is occurring on a large scale now. Business is weeding out the over-ripe ones.

Thus it comes, reasonably enough, that a period of bad business is really a good thing for business, because it drives business back to its sounder fundamentals of honor in negotiations, quality in merchandise, and willingness in service.

It is a splendid lesson for the younger group of business men. They will keep their heads better during the next rise of commercial prosperity. They will be taught to trust more confidently in those principles of business which are as indispensable in brisk times as in slow times.

And, on the whole, it has been an easy lesson. It might have been much more severe. It will have been worth all it cost to all classes of society, if only we have sense enough to remember it.

We have been influenced too much by the grab-bag philosophy. We are making careers, and that is incompatible with the practice of "getting while the getting is good." Such getting is not good for long.

It is generally easy to get over the wet places by the aid of a boy; DR. SHANTZ maneuvering a difficult spot on his 9,500-mile exploring trip through Africa.

Praise for the "Wilds" of Africa

By ROBERT KENTON

GETTING around in Africa, even in its wildest and most uncivilized parts, is not nearly so difficult as one judging by tradition, if not what generally is written, might imagine, says Dr. H. L. Shantz, of the Bureau of Plant Industry, United States Department of Agriculture.

Dr. Shantz arrived in Washington about the first of the year from the Dark Continent where he spent twelve months' time roaming around in search of desirable plants that might be introduced into our agriculture. He traveled more than 9,500 miles on the African continent, making the full trip from the Cape of Good Hope to Cairo, Egypt, with extensive side and cross journeys in addition. With him on all his travels was H. C. Raven, a faunal naturalist, who collected animal specimens for the Smithsonian Institution. The party at its start included several others, representatives of a motion picture concern and a newspaperman. It met several mishaps as a party. Two of the movie men lost their lives; not from attacks by wild beasts or from strange diseases, but in a railroad accident. The two scientists, who did the most and the greatest extremes of traveling, came through without a scar or scratch.

"Traveling in Africa is safer than walking around the streets of the average American city," says Dr. Shantz. "If one goes beyond the outposts of civilization, one must be willing to rough it a little, but you can get around anywhere in Africa with a fair degree of comfort. Food was always plentiful and cheap. The continent is pierced by transportation lines of various sorts, but if you go far you must be prepared on occasion to hike. About the only disease you need worry much about is malaria and then only when you are in the tropics, where if you are careful you can easily avoid it. Sleeping sickness and the tsetse fiy have been exaggerated, especially as a danger to the white man. The fly that carries the disease keeps away from the civilized settlements. Seventy per cent of natives attacked by sleeping sickness are now cured when treated with a famous remedy for another disease.

"As far as wild beasts are concerned I saw many in their native haunts and not one made any effort to attack me. The natives were docile, kindly and peaceful. In fact no one of us had occasion to fire a shot in self-defense."

Yet the two scientists explored much of the wild jungle area of the Upper Congo, and traveled for more than 300 miles beyond earmarks of civilization into the wild animal country of British East Africa.

You can now get into the "heart of Africa" about as easily as traveling from Chicago to San Francisco, that is, after you get to Africa. The scientists traveled over the vast region of South Africa, Cape Colony, Natal, the Transvaal and Rhodesia, mainly by train. It was at Bukoma on the border of the Belgian Congo where, if one struck the keynote of high adventure generally apparent in stories of African adventure, it would be said that the Americans plunged into the wilds. Bukoma is nearly 3,000 miles from the Cape of Good Hope; yet the distance can be covered entirely by train. And for all except the last 250 miles there are fast through trains with sleeping and dining cars as good as you will find anywhere. At the terminal, however, there is no hotel or other provision for tourists. Indeed, the American scientists were directed to a "European Hotel" which they found to be nothing but a bare lot where travelers usually camp. They were able to get a room in the home of a Portuguese trader, and lived comfortably while awaiting a boat that makes the Upper Congo.

There are good boats on the big rivers and lakes, and many that are not good. The "Louis Cousin" which the Americans patronized in getting into the Congo provides staterooms for first-class passengers, and the captain, if he wishes, may let you mess with him. Otherwise, you must take along your own commissary and let your "boy"—every foreign traveler in Africa has a man servant called "boy"—prepare your meals in transit. Other boats in that section don't provide staterooms or any sort of eating privileges. Those shortcomings are not very serious, for all boats stop when it becomes dark and permit the passengers to get off and do their cooking and sleeping, too, if desired, on the ground. Boats don't travel at night because the tortuous course of the river makes navigation dangerous when the pilot cannot keep tab on the current.

At Mabele the Americans found provision for travelers in the form of grass huts, without equipment, wherein they could rent living quarters at five francs a day each.

After exploring the vicinity of Mabele, they went on to Kongola, almost in the interior of the Congo, and from Kongola they were able to get to Kindu by train. There an official of the Belgian Government took them through the adjacent wilds in an American-made automobile.

Automobiles are not unknown even in the most remote regions of Africa, says Dr. Shantz, and most of those used are of American origin. They even found several native chiefs of tribes the proud owners of American cars.

The scientists, in fact, toured the big game country of British East Africa in cars that had been built for war service. They operated out of Nairobi, which, while on the equator, is one of the most pleasant spots to be found anywhere. It was often so cool that fires were desirable; so cool in fact that one shivering traveler remarked to the Americans that the next time he ventured into the African tropics he was going to take a stove along. Nairobi is quite an up-to-date and civilized community, being on a railroad that runs from the Indian Ocean to beautiful Lake Tanganyiki. North of there is the prime big game area of Africa, the section wherein Roosevelt made his famous hunting trip. The only regular means of transportation provided for the section is an ox transport that moves at the rate of two miles an hour from Nairobi to the Abyssinian border. It was too slow for the Americans, who also wanted to get away from the beaten tracks. They were able to rent two automobiles. Then arose the question of gasoline. It was very scarce in Nairobi and non-existent in the country they wanted to explore. Though it was selling in the open market for as high as $8 a gallon, they were able to get supplies at a fairly reasonable price—for Africa. Then they faced the problem of getting very far from the base of supply, for they could carry only so much fuel and had to take along living supplies and other things. They first took out as many cans of gasoline as they could carry and planted a large part of it about 75 miles from base, and returned to Nairobi for more. Then they made another planting in the bush farther on and again returned for more. In that way they were able to maneuver as far as 300 miles from base, which was the longest distance anyone had ever gone into the big game country by motor.

"Are big animals still numerous over there?" I asked Dr. Shantz.

"From what we saw they are still quite numerous," he replied. "We saw one string of big game, made up chiefly of zebra, gazelle and onyx that stretched out for a distance of at least three miles. We saw many herds of elephants, quite a few rhinoceroses and several lions."

"Did any of them make trouble for you?"

"No, not in a serious sense. A lioness dropped out of the bush and stalked my car one day for a few minutes and she looked as if she meant business. But before I felt like shooting—you are not supposed to kill big game unless you have a license that costs about $750—she walked back into the bush. A herd of elephants began to stamp around camp one night, and it made us pretty nervous. I am confident they just happened to be passing and were not looking for trouble. But we built fires around our tents for protection."

The wild animals, says Dr. Shantz, showed great interest in the automobiles. At night the lights seemed to have great fascination for them. They would come up to the road and seem afraid to go through the light rays in front of the cars, would run along beside the light for some time and finally try to jump over it as if they thought it were fire. This was true chiefly of zebra. The lights also seemed to attract hyenas and jackals which are very numerous. The automobiles didn't startle the wild animals so much as they did some of the natives in remote districts. Often when a native would see a car coming there would be a pitiful and almost frantic display of fear.

But for the African native, Dr. Shantz has only kind words and grateful thoughts, and especially for those who are out of contact with white civilization.

"Those you find around the civilized settlements of white people are largely just common Negroes," said he. "When you get out into the bush and come in contact with the so-called savage still living his own life, you usually meet very interesting and in many ways fascinating people. They are friendly and hospitably inclined and very companionable."

"But not much for clothing?" I suggested.

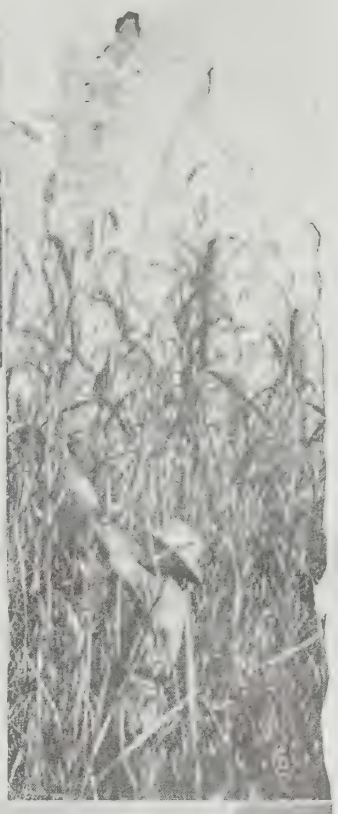
"No. But I should say that those who don't wear clothing look better than those who do. Often the only garment worn is a piece of animal skin over the shoulder in the case of men and a belt with a dangling 'tail' behind in the case of women. But there is nothing immodest in their handsome nakedness. The members of some tribes are very handsome."

The native tribe that Dr. Shantz likes most to tell about is the Watusi in Urundi by Lake Tanganyiki, an area added by the Peace Conference to Belgium's possessions. The people, he says, show many evidences of being of at least part Caucasian origin. Though dark of color they lack many features of the pure Ethiopian, are intelligent, high-spirited and superior. The Watusi are the native aristocrats, maintaining a sort of supremacy over the pure blacks. There is reason for believing, he says, that they are descendants of the ancient Egyptians.

Dr. Shantz brought or sent back more than 1,600 specimens of African plant life that seem to afford possibilities for American cultivation. These are now being tested with the view of adoption, and of course it will be many years before we will know which of them can be made successful in this country.

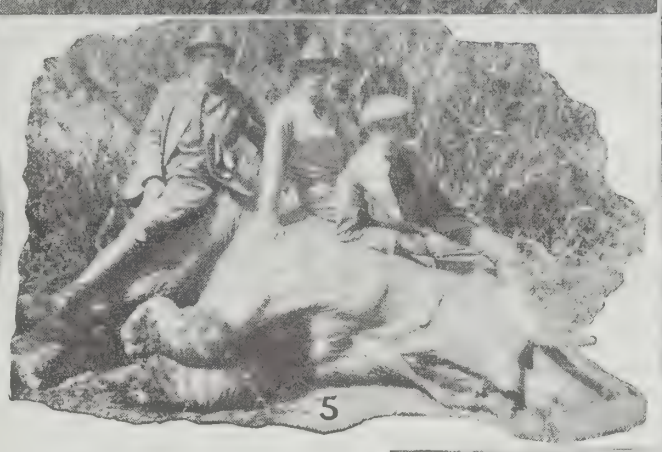
"There are many popular misconceptions about Africa," Dr. Shantz declares. "One of the falsest concerns the climate. Of course in the desert regions of North Africa it is fearfully hot. We found it rather warm along the Nile, as we came out. But in Central Africa, the equatorial region, the climate was usually delightful. Of course there is much rain in the wet seasons. But, even in the jungles of the Congo, I never saw the temperature go beyond 87. And in the semi-temperate zone of South Africa the climate is almost perfect.

DUM PALM IN EAST AFRICA



"Traveling is by no means as difficult or dangerous as you might think, or as many have pictured. There are many rail and boat lines and ox and camel transports. We ran into white women traveling alone with perfect safety and fair comfort in those regions that were first explored a generation or two ago."

You can now, says he, almost make the trip from the Cape to Cairo by rail, water or transport line. But if you make it direct, it is necessary, at one or two points, to hike over quite long distances. The longest he and Mr. Raven had to make afoot was from Numuli to Rejof, north of Uganda in the Lower Sudan, and just above the equator. The gap is 115 miles long. At Rejof they got a boat that connected with the line of Nile communications, which they followed, by boat and rail, to Cairo. The scientists were away from America for fourteen months and in Africa almost exactly one year.



"Africa is a wonderfully rich continent," Dr. Shantz declares, "and exceedingly varied. The white man is subduing it rapidly. No longer can you get very far away from white settlements and the aspects of modern civilization. But much of it is still gloriously wild and uncivilized. Those were the sections that interested me most. The immense native plant life is still but partially known. Great areas have not yet been explored for desirable plants. No doubt numerous and valuable additions to civilized agriculture are still to come from there."

The Jewish Aspect of the "Movie" Problem

America's United Protest Against the Sex and Criminal Photoplay Has Gone Unheeded. Who and What Controls the Movies?

THERE was once a man named Anthony Comstock who was the enemy of public lewdness. Of course he was never popular. No newspaper ever spoke of him without a jeer. He became the stock joke of his time—and it was not very long ago. He died in 1915. It is very noticeable that the men who mocked his life with banal jesting were non-Jews. It is also worth recording that the men who profited from the commercializing of much of the vice which he fought, were Jews. It was a very familiar triangle—the morally indignant non-Jew fighting against public lechery, and the Jewish instigators of it hiding behind ribald Gentiles and Gentile newspapers.

Well, the fight is still going on. If you will subscribe to a clipping bureau, or if you will look over the press of the country, you will see that the problem of the immoral show has been neither settled nor silenced. In every part of the country it is intensely alive just now. In almost every state there are movie censorship bills pending, with the old "wet" and gambling elements against them, and the awakened part of the decent population in favor of them; always, the Jewish producing firms constituting the silent pressure behind the opposition.

This is a grave fact. Standing alone it would seem to charge a certain Jewish element with intentional gross immorality. But that hardly states the condition. There are two standards in the United States, one ruling very largely in the production of plays, the other reigning, when it does reign, in the general public. One is an Oriental ideal—"If you can't go as far as you like, go as far as you can." It gravitates naturally to the flesh and its exposure, its natural psychic habitat is among the more sensual emotions.

This Oriental view is essentially different from the Anglo-Saxon, the American view. And it knows this. Thus is the opposition to censorship accounted for. It is not that producers of Semitic origin have deliberately set out to be bad according to their own standards, but they know that their whole taste and temper are different from the prevailing standards of the American people; and if censorship were established, there would be danger of American standards being officially recognized, and that is what they would prevent. Many of these producers don't know how filthy their stuff is—it is so natural to them.

A Sex Play Earns $200,000

SCARCELY an American home has not voiced its complaint against the movies. Perhaps no single method of entertainment has ever received such widespread and unanimous criticism as the movies, for the reason that everywhere their lure and their lasciviousness have been felt. There *are* good pictures, of course; it were a pity if that much could not be said; we cling to that statement as if it might prove a ladder to lift us above the cesspool which the most popular form of public entertainment has become.

The case has been stated so often that repetition is needless. Responsible men and organizations have made their protests, without results. The moral appeal meets no response in those to whom it is made, because they are able to understand only appeals that touch their material interests. As the matter now stands, the American Public is as helpless against the films as it is against any other exaggerated expression of Jewish power. And the American Public will continue helpless until it receives such an impression of its helplessness as to shock it into protective action.

In a powerful indictment of the movie tendency and the National Board of Review of Motion Pictures, Frederick Boyd Stevenson writes in the Brooklyn *Eagle*:

"On the other hand the reels are reeking with filth. They are slimy with sex plays. They are overlapping one another with crime.

"From bad to worse these conditions have been growing. The plea is set up that the motion picture industry is the fourth or fifth in the United States, and we must be careful not to disrupt it. A decent photoplay, it is argued, brings gross returns of, say, $100,000, while a successful sex play brings from $250,000 to $2,500,000."

Dr. James Empringham was recently quoted in the New York *World* as saying: "I attended a meeting of motion picture owners in New York, and I was the only Christian present. The remainder of the company consisted of 500 un-Christian Jews."

Now, there is little wisdom in discoursing against evil in the movies and deliberately closing our eyes to the forces behind the evil.

The method of reform must change. In earlier years, when the United States presented a more general Aryan complexion of mind and conscience, it was only necessary to expose the evil to cure it. The evils we suffered from were lapses, they were the fruits of moral inertia or drifting; the sharp word of recall stiffened the moral fiber of the guilty parties and cleared up the untoward condition. That is, evil doers of our own general racial type could be shamed into decency, or at least respectability.

That method is no longer possible. The basic conscience is no longer present to touch. The men now mostly concerned with the production of scenic and dramatic filth are not to be reached that way. They do not believe, in the first place, that it is filth. They cannot understand, in the second place, that they are really pandering to and increasing human depravity. When there does reach their mentalities the force of protest, it strikes them as being very funny; they cannot understand it; they explain it as due to morbidity, jealousy or—as we hear now—anti-Semitism.

Extent of Jewish Movie Control

READER, beware! if you so much as resent the filth of the mass of the movies, you will fall under the judgment of anti-Semitism. The movies are of Jewish production. If you fight filth, the fight carries you straight into the Jewish camp because the majority of the producers are there. And then you are "attacking the Jews."

If the Jews would throw out of their camp the men and methods that so continuously bring shame upon the Jewish name, this fight for decency could be conducted without so much racial reference.

An analysis of the motion picture industry in the United States will show:

That 90 per cent of the production of pictures is in the hands of 10 large concerns located in New York City and Los Angeles.

That each of these has under it a number of complete units, making up the large aggregate of companies seen in photoplays all over the world.

That these parent concerns control the market.

That 85 per cent of these parent concerns are in the hands of Jews.

That they constitute an invincible centralized organization which distributes its products to tens of thousands of exhibitors, the majority of whom are Jews of an inferior type.

That the independent motion pictures have no distributing center but sell in the open market.

It may come as a surprise to many people that there is no dearth of good pictures. The trouble is that there is no means by which good pictures can reach the public. One of the notable libraries of beautiful pictures, containing the cream of dramatic and educational films, has been rendered absolutely useless because of the impossibility of getting them before the public. The owners of these pictures achieved a little advance by engaging Jewish salesmen to push the pictures, but against them has always been the huge and silent force of that concentrated opposition which is apparently against the introduction of decency and delight into the screen world.

Once in a while an independent producer like David Wark Griffith or Charles Ray gives the world a screen production that is not only without offense or propaganda, but is a veritable delight and joy. These pictures, with their attendant success, are the strongest answers that can be made to the cry of some producers that the only profitable plays are the nasty ones.

That cry, of course, is based on fact. Without doubt, as things now go, the nasty pictures are the more profitable, because they are the most elaborately made and the most gorgeously advertised. The very lewdest of them have secured their patronage by advertising that they deal with "moral problems."

"Public Demand" a False Plea

BUT all public taste is cultivated. Every city which can boast of public spirit has citizens who spend tens of thousands of dollars annually in an attempt to create a community taste for good music. They succeed to a certain extent, but very rarely do they make it pay. It appears that the work of demoralizing the public taste is far more profitable. And as our whole range of public entertainment, outside of the higher musical field, has fallen into the hands of groups who do not know what the term "art" means, it is evident how overwhelming the appeal of the dollar must be.

If the public taste is now so fixedly demoralized that the moving picture producers can confidently claim that "the public demands what we are giving it," the case is more damning than otherwise. For it is recognized by all detached observers that such a public taste is a most urgent reason why immediate and heroic remedies should be adopted.

Cocaine peddlers can easily establish a "public demand" for their drugs, and they do. But that demand is never considered to be an extenuation for the peddling of "coke." So with the psychic poison and visual filth of the ordinary movie—the demand it has created is morally lawless, and the further satisfaction of the demand is morally lawless too.

Carl Laemmle, one of the leading producers in America and head of the Universal Film Company, testified before a congressional committee that he had sent a circular entitled "What Do You Want?" to the exhibitors who bought his pictures. At that time his company was in communication with about 22,000 exhibitors. Mr. Laemmle says that he expected about 95 per cent of the answers to favor clean, wholesome pictures, but "instead of finding 95 per cent favoring clean pictures, I discovered that at least one-half, or possibly 60 per cent, want pictures to be risque, the French for smutty."

Laemmle himself is a German-born Jew, and did not state what percentage of the replies were from people of what is euphoniously termed his "faith."

It is a very noticeable fact that whenever any attempt is made to control the tumultuous indecency and triviality which the movies ceaselessly pour out day and night upon the American public, the opposition thereto is Jewish. Take, for example, the attempt to rouse the sober spirit of America to a proper appreciation of what is happening to Sunday, the Day of Rest. The opponents of the whole movement—a movement for the awakening of conscience, not for the passage of laws—are Jews, and they justify their opposition on Jewish grounds.

Whenever the movies are before the bar of public opinion, their defenders as they are, are Jews. In the congressional hearing before referred to, the lawyers who appeared for the companies were all Jews, distinguished by the names Meyers, Ludvigh, Kolm, Friend and Rosenthal.

There was even a Jewish rabbi involved, who gave a most ingenuous explanation both of Jewish control of the movies and also of Jewish opposition to control of the character of the movies.

A Rabbi Shows How Easy It Is

"I AM a Jew," he said. "You know as well as I do that we have been the unfortunate victims of the nasty, biting tongue, and you know as well as I do that the movie first held us up to ridicule, and we have not only been disgraced in these movies, but we have had our religion traduced, and disgracefully traduced."

If this is true, it is chargeable to the Jews themselves, for Jews have always controlled the business. That it is true is probable, for the most zealous lampooners of the Jews have been Jewish comedians. Non-Jews fail abjectly in endeavoring to portray the character.

"We felt very much hurt," he continued, "and we felt there was a remedy, and that remedy was public opinion; and what did we do? We did not come to Congress. We organized a society—the Independent Order of B'nai B'rith which is the largest Jewish fraternal order in the world. It organized what is called the anti-defamation league with headquarters in Chicago; and the league for the defense of the Jewish name united with other people—in the Catholic Church, the Truth Society and Holy Name Society—and it wrote to all the movie manufacturers of the country asking them that they do not traduce the Jewish character and the Jewish religion, and that they do not hold us up to ridicule; that we did not object to the depiction of Jewish character, but we did object to the caricature of Jewish character and the caricature of our name and religion; and after thus having explained to the manufacturers our position, we appointed a committee of men in every city in the country, asking them that they appeal to the municipal authorities that they permit not the presentation of pictures that were calculated to offend the Jewish character and the Jewish sensitiveness.

"What has been the result? There has been necessary not a protest, because movies in this country are not producing that class of movies any longer."

Of course! there are excellent reasons why the Jewish protests, if any really were necessary, should be instantly obeyed.

But why has not the continued and clamorous protest of decent America been equally heeded? Why

not? Because the protest has come largely from non-Jews.

If the Jews can control the movies to the extent the rabbi claimed, why *cannot they control them for decency*—why *do not they control them for decency?*

The one weakness of the rabbi's statement is the charge that the Jewish religion was traduced. It would be most interesting to learn how this was done, and by whom. It is a religion which does not easily lend itself to that sort of treatment, picturesque as some of its forms may appear to alien eyes.

There is, however, a meaning hidden in this statement of the rabbi. The Jew considers any public expression of Christian character as being derogatory to his religion. For example: if the President of the United States or the governor of your state should make a specifically Christian allusion in his Thanksgiving Proclamation, or mention the name of Christ, that act would be protested as offensive to Jewish sensitiveness. Not only would be done, but has been done.

In the same hearing referred to, quotation was made from a letter written by Carl H. Pierce, special representative of the Oliver Morosco Photoplay Company, to the executive secretary of the Motion Picture Board of Trade, in which the following statement appeared:

"You and I have seen boards turn down such plays as the 'Life of the Savior' because they thought it might offend the Hebrews."

It is apparent that "Jewish sensitiveness" is a spoiled child which has been unduly coddled and that it has interfered to such an extent that the real question becomes one of non-Jewish rights.

The Jewish defenders have been asking, Why should a nation of 110,000,000 people be considered in danger from 3,000,000 Jews? And "Gentile fronts," with all the zest of a new idea, have shouted the same challenging question.

It might be advantageous to answer thus: Why should a country of 110,000,000 people, mostly of Christian faith and practice, be prevented from seeing the "Life of the Savior" portrayed on the screen because it is feared to offend the Jews?

The answer in both cases is not a comparison of numbers, but a recognition of the fact that, as in the motion picture world the Jews are at the neck of the bottle where they can absolutely control what goes to the public, so they are in other fields at corresponding places of control.

But whether the Jewish producer is qualified to do better than he is doing is a question. When you consider the conditions from which many of them sprang, you will be rendered rather hopeless of voluntary reform.

Why were not "Way Down East" and "The Shepherd of the Hills" put on the screen by Jews? Because the Jews in control of the movies have no knowledge of American rural life, and therefore no feeling for it. The Jew is a product of city life, and that peculiar phase of city life which is found in the ghetto. He sees in a farmer only a "hick" and a "rube." You may rest entirely assured that it was not the Yankee, himself a product of the farms, who turned the agriculturist into a joke, until today the joke has emptied our farms of men. The theatrical "hick" and "rube" of the gold-brick story and the hayseed play, were of Jewish origin. The Jew is a product of city life, and of that phase of city life where the "wits" play a large part. The America of the average Jew who caters to the entertainment of Americans is comprehended in a beaten path from the box-office, to back-stage, and thence to an eating place. He doesn't know America as yet, except as a huge aphis which he may milk.

The Peculiar Racial Bent of the Movies

IT FOLLOWS, therefore, that in all probability he is equally ignorant of American home life. He has not as yet been able to understand what American domesticity means. The American home is an almost unknown quantity to foreigners of the eastern races. An Armenian woman who has lived in America for five years says that she knows nothing of an American home save what she can see through the windows as she passes. This, of course, is a lack not easily to be bridged over. It may not be strictly true that the majority of movie producers do not know the interiors of American homes, but there is certainly every indication that they have not caught its spirit, and that their misrepresentation of it is more than a false picture, it is also a most dangerous influence.

It is dangerous to foreigners who gain their most impressive ideas of American life from the stage. It is dangerous to Americans who fancy that the life of the screen is the life that is lived by "the better classes." If we could map the community mind of whole sections of our cities, and trace the impressions of American people, American habits and American standards which those mind-groups hold, we should then see the dangerous misrepresentation which movie producers have given to things American. Falsity, artificiality, criminality and jazz are the keynotes of the mass of screen productions.

American life is bare and meager to the eastern mind. It is not sensuous enough. It is devoid of intrigue. Its women of the homes do not play continuously and hysterically on the sex motif. It is a life made good and durable by interior qualities of faith and quietness—and these, of course, are ennui and death to the Orientally minded.

There lies the whole secret of the movies' moral failure: they are not American and their producers are racially unqualified to reproduce the American atmosphere. An influence which is racially, morally and idealistically foreign to America, has been given the powerful projecting force of the motion picture business, and the consequences are what we see.

The purpose of this and succeeding articles is not to lift hands in horror and point out how rotten the movies are. Everybody is doing that. The case against the movies is not contested at all. It is unanimous. Women's clubs, teachers, newspaper editors, police officers, judges of the courts, ministers of religion, physicians, mothers and fathers—everybody knows just what the movies are.

What all these disgusted groups evidently do not know is this: their protests will be entirely useless until they realize that behind the movies there is another group of definite moral and racial complexion to whom the protest of non-Jews amounts to next to nothing at all, if they can possibly circumvent it.

As the rabbi previously quoted showed, the Jews got what they wanted from the producers as soon as they made their request.

What have the non-Jewish teachers, women's clubs, newspaper editors, police officers and judges, ministers of religion, physicians, and just plain parents of the rising generation—what have *they* obtained for all their complaints and protests?

Nothing!

And they can go on beating the air for a lifetime and still obtain no improvement, unless they face the unpleasant racial fact that the movies are Jewish. It is not a question of morals—that question has been settled; it is a question of management.

When the people know *who* and *what* is this intangible influence we call the "movies," the problem may not appear so baffling.

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

A resolution introduced by Senator Smoot and adopted by unanimous consent, in the United States Senate the other day, calls upon the War Department to furnish that body with full information concerning credit extended by this country to Poland. Mr. Smoot declined to comment on the purpose of the proposed inquiry. As fairly reflective of the attitude of the Jewish press in the matter, the following is quoted from the Chicago *Israelite*: "It is to be hoped that no further credit will be given to Poland, or any other of the newly created states until they give satisfactory proof of their intention to comply with the terms of the treaties which called them into existence and protect minorities from massacre." Apparently the proof must be "satisfactory," not merely to the governments of the Allies and Associated Powers, but also or rather first of all, to the Jewish financial powers.

Among the three new justices of the supreme court of the state of New York recently formally inaugurated is the Jew, Isador Wasservogel. These judges are elected for a term of fourteen years and each receives a salary of $17,500 a year.

The Jewish propaganda play woven about the character of Haym Salomon, a Philadelphia Jew, having fallen flat, the Jews have brought into the limelight Maurice Salomon, lineal descendant. This young man is out in a protest, in the New York *World,* against the movement for the restoration of the Christian Sabbath. "It is repulsive to me as an American, to think that the country that my ancestors fought and died for and the country that I bled for is sectarian." He concludes with this particularly "Semitic" suggestion: "I think that men of the Christian type and character that tend to raise the question that this is a Christian country from the standpoint of religion are as poisonous to our country as the Bolsheviki, are as detrimental to our country as any alien who comes here and preaches sedition, and are even more detrimental to our country than the viper who interfered with the draft."

"Let Others Lead" is the heading in a Jewish paper on an article dealing with the attacks by a Jewish assemblyman in New York and the Jewish Sabbath Observance Society of that city on the movement of certain Christian churches to preserve the Christian Sabbath as a day of rest. The editor goes on to ask, "Why should we strongly oppose this movement as Jews? This is a question to settle as Americans. It is clearly counter to the First Amendment to the Constitution, in seeking to abridge religious liberty, and Senator Smoot, of Utah, has expressed his willingness to lead the opposition in the Senate. The League for the Preservation of Sunday Recreation is well fitted to bear the brunt of this struggle, and the Freethinkers Society of New York will raise the religious issue. Let others lead in this fight. If we are so unwise as to step in front, the anti-Semite will say that Jews are interested because they control so many movies, and our concern is wholly commercial. To prevent this *half-truth,* let other forces accept the leadership."

Maurice Ruben, a Pittsburgh Jew, is thus quoted in the Pittsburgh *Dispatch*: "While in Detroit we made special inquiry regarding the series of articles which have now been published in pamphlet form. We believe that the articles have been misrepresented and misunderstood by the press at large, and undue sentiment was made by the cry of 'Anti-Semitism.'"

Gilbert K. Chesterton, the famous British author who is now lecturing in America, is one of those men who are called "anti-Semites" because they see the mountain of Jewish facts which exist in the world. The list of "anti-Semites," who are not that at all, but who have not been cowed by organized Jewish pressure, is quite a distinguished one.

Rabbi Israel Goldfarb declared at a meeting in Brooklyn that the Jew should be different in every respect from the non-Jew, according to a report in the Brooklyn *Eagle.* "If we mingle freely and assimilate with the non-Jews, Judaism will be lost," he said.

Jewish Bolshevist propagandists have been caught working in Japan.

Says Samuel Bromberg, D. D. S., in the Chicago *Israelite*: "The Jewish young man does not marry a Gentile girl . . . . The Jewish young man or young woman may philander around in Gentile circles and come back to the home fold and boast of it as a conquest, but it is only a case of forbidden fruit tasting sweetest. When the time comes for mating, he or she knows where to choose. Like attracts like; water seeks its own level." Christian girls may be interested to know about these Jewish philanderers.

So intense is the anti-Jewish feeling becoming in France in consequence of the exposure of outrageous cases of profiteering, especially in food supplies, that a group of students recently succeeded in preventing the production of a play by the Jewish author, Bernstein, as the Comédie Française.

Despite the persistent shouts of "anti-Semitism" in Jugo-Slavia, a Jew, Dr. Pops, was recently elected vice mayor of Belgrade, the capital city of the kingdom.

Rabbi Rudolph I. Coffee, in the Chicago *Sentinel,* heartily commends the suggestion of Oscar S. Straus to the President-elect "that a Jew be sent as ambassador to Germany." This on the ground that such an appointment "would be a crushing blow to anti-Semitism." What weirdly inconsequent views our Jewish leaders seem to entertain as to the delicate nature and functions of diplomatic relations between friendly nations—and of course there are no diplomatic relations between unfriendly nations.

The new cabinet privately made defense against the statements being made about the international Jews, is this: "The statements are dangerous, not because they are lies, but because they are half-truths, and by the time we are done admitting the half that is true, we have spoiled the chance of denying the half that is untrue." But why not begin at the half which is untrue? Even that would be better than the inane "'tain't so" that has marked Jewish defense so far.

Jewish residents of Brooklyn, New York, are raising an initial fund of $100,000 to build a Hebrew school in the eastern district of that borough.

The Jewish papers are reminding us that Mary Garden's notable musical career was made possible by the generosity of Mr. and Mrs. David Mayer, of Chicago, who befriended her when she was a poor Scotch girl and sent her abroad for her musical education at a cost to them of some $20,000. The story is an old one, and it is never told by the Jews without the recital of its epilogue as an instance of gross ingratitude on the part of a Goy genius, Mary Garden, after she attained success and fame, publicly snubbing her benefactress, Mrs. Mayer. What the Jews do not tell is that the singer religiously paid back all the money that the Mayers had advanced with interest and with keen appreciation of a kindness that was probably not entirely disconnected with assurance that her voice was a good investment. The snub was administered as a last desperate measure of self-defense against a persistent circulation of the story of her indebtedness and constant attempts by the Mayers to parade their ownership of the prima donna, making themselves an insufferable pest. Mary Garden's recent appointment as director-general of the Chicago Grand Opera Company, and a desire to block her success in that post by an attempt to hurt and humiliate her, probably accounts for the present revival of the old bit of ill-natured gossip.

Isadore Luckstone is regarded as one of the foremost opera coaches in America. Myrtle Moses, contralto, of the Chicago Opera Company, who died recently, was the wife of Samuel G. Alschuler, who has given a handsome donation for the extension concerts of the Musicians' Club of Women in her memory.

Abraham Lincoln Eulogized by Bismarck

Conversations of Famous Statesman With Neighbor Youth Recalled

By CONRAD SIEM

"SOMETIMES there comes a man down from the solitude who in the isolation and the frugality of the wilderness has learned the verities of life and acquired the strength of character to stay uncorrupted among the lures and the sham of our artificial society. Such a man was Abraham Lincoln. His coming was a fortunate event for the people of the United States of America and it will be forever a day of sorrow for all the nations in Christendom that his blood was needed to seal anew the covenant of their Union." Thus spoke Bismarck.

It was in the late summer of 1876. Bismarck had returned to the quietness of Friedrichsruhe in search of recuperation after the travails of the Congress of Berlin. The fiasco his statesmanship had suffered at the hands of Disraeli was preying upon his mind. He knew the economic conditions of Germany to be in a bad state. The boom after the Franco-Prussian War had led to many speculative excesses of German business. For ulterior purposes these excesses had been aided and abetted by the uniting of international financiers who thereby had gotten the power to bring about the total collapse of Germany's economic structure by the withdrawal of their financial support. So when Disraeli as spokesman for the Rothschilds had threatened Germany with a money panic Bismarck could not do otherwise than accede to the political demands of England.

Bismarck was by far too prudent a man to discuss at large the true reason for his defeat as a statesman. Very few would have understood or heeded him in making this excuse. An exposé of the chicanery of the big Jew bankers would not have altered any of the circumstances and might have been very injurious by destroying the self-confidence of German business. However, his mind was busy to evolve the means of preventing in the future the eventuality of letting a clique of international financiers prescribe the political actions of the statesmen of Germany. So he came to search for wisdom in the speeches, letters and messages of Abraham Lincoln. He knew that this great American had been confronted by the sinister intrigues of the selfsame clique, had outplayed them and foiled them.

I was in the habit at the time of wandering from my grandfather's garden into the adjoining grounds of Friedrichsruhe, and for some reason Bismarck seemed to take delight in talking to me, a boy just out of school. Maybe his heart was full with the wisdom of Lincoln, and deeming it unwise to discuss him with his contemporaries who might have misinterpreted him, and not caring to formulate his thoughts in writing, he may have thought clearness of conceptions for himself by teaching me the greatness of the Emancipator. And I was a truth-hungry listener and eager to hear about the man whom Bismarck pronounced to have been the wisest statesman born in Christianity.

Conspiracy of Long Standing

"THERE eannot be any question, in fact I know"—Bismarck speaking—"that many years before the actual outbreak of the Civil War in North America it had been secretly decreed by the inner financial circle of Europe to split the United States apart into two co-equal federations. There was fear that the United States with its growth as a nation would aspire to establish its economic and financial freedom, as it had achieved its political independence, by setting up a monetary régime of its own, inimical to the interests of the European bankers, and which in the end might upset altogether Europe's capitalistic control of the world.

"Of course, in this inner circle the voice of the Rothschilds was paramount. These bankers saw for themselves golden opportunities in the eventuality of a split that would divide a strong, self-reliant, debt-free republic into two weak, bickering, money-borrowing democracies easy to be exploited with the help of Jewish financial jugglery. So they sent adroit clandestine agents into the field to bring about an open break between the North and the South by agitating both sides of the slavery question. This question had naturally a very strong hold on the popular imagination, and using it as a leverage the hirelings of the Jew bankers found it easy enough work to raise the partisanship of the American people to the pitch of:—Here abolition! Here secession!

"I doubt whether Abraham Lincoln had before his inauguration the least inkling of the underhanded work of these foreign agents. Though never by any means an extremist he had been a consistent anti-slavery partisan, and it was because of his decided partisanship that he had been nominated and elected as President of the United States. However, such was the character of the man that as soon as he had entered into the presidency he ceased to be a partisan and became conscious only of the fact that he was the President of all the people of the United States. In the high consciousness of his official impartiality the light came to him, and his heart being free from all rancor and selfish desires he saw clearly the evil design of Europe's dark financiers who were seeking to use him as their tool.

"Meanwhile the open break between the North and the South had become unavoidable. The Southern Confederacy was organized, and war was started. The masters of European finance were busily laying their plans how to turn the situation to their immediate pecuniary advantage as well as to assure the permanency of the schism between the Southern Confederacy and the Northern Federation. But in all their calculations they were underestimating by far the strength of character and the resourcefulness of Abraham Lincoln.

"His new personality as President was to them rather a great surprise. They had not seriously opposed his candidacy for the presidency. On the contrary their secret agents had done their full share in helping to elect him, thinking that this unsophisticated backwoodsman would prove himself an easy victim to oriental cunning. But Lincoln on assuming the responsibility of his high office had been gifted with the clear vision that saw through all the moves of their nefarious game. He fully realized that it would not be so much the southern states whom he would have to fight as it would be the cabals of the Jew-ridden European capitalistic system.

"This realization must have caused this high-minded man many heavy and sorrowful hours. He practically stood alone. He did not know who of his advisers, officials or generals had been tainted by the blandishments of the invisible money power. He could not lay bare to the people his knowledge of the sinister forces that for their own evil purposes had brought the calamity upon the country. It would have added only to the confusion by bringing on additional dissensions. Besides the people at large would have failed to comprehend the exotic scheme and might have derided him. So like the wise man that he was he concluded to keep his own council in watching and meeting the moves of the Hidden Hand.

Eliminated International Finance

"UP TO his day it had been the general belief of the modern world that wars could be fought only with the assistance of the bankers. In fact at the time all the European statesmen were laboring more or less under the hallucination that without the consent of the Rothschilds wars could not occur. These bankers were the principal lenders of money to the nations, and by their acceptances national bonds were converted into cash. Any nation negotiating loans outside of the regular channels or issuing fiat money would soon lose its credit at home and abroad, and without money or credit wars cannot be fought.

"The ruling condition then seemed to make the reckonings of Dark Finance conclusive that the Civil War would be of short duration and would have to terminate as soon as it—Dark Finance—saw fit to shut down on the credit of the Northern Federation with a peace that would permanently establish two co-equal democracies on the North American continent. Lincoln saw clearly how the money devils were figuring, and he has proven his true greatness by evolving and fearlessly applying the correct counter move.

"I don't believe that Lincoln, before his election to the presidency, had ever given much thought to matters of national or international finance. Like all of us he had been largely accepting the money rule as it was without analyzing the principles on which it was based. When, however, he was confronted by the exigencies of the Civil War and saw his country in danger of partition his keen mind penetrated through all the false glamour of international finance, and his innate truthfulness and strong common sense helped him to brush aside all its pretentiousness and to arrive at the bottom fact that the source of all money is the labor and the thrift of the people. So to his high simplicity it became just the question how to make the savings of the people directly available to the government without the intermediation of professional financiers.

"Shortly after the beginning of the Civil War the United States Congress, misled undoubtedly by hired lobbyists, had authorized issues of fiat paper currency. Lincoln perceived clearly how such a procedure would quickly undermine the credit of the government not alone with foreign nations but as well with its own people. Therefore he refused to sanction further like issues, but prevailed upon Congress to authorize government loans to be floated by selling the United States bonds directly to the people. And in connection with this came his master stroke by suggesting: *'On the security of these bonds deposited with the Treasury, the government may issue circulating notes.'*

If He Had Not Died

"BY THIS stroke Lincoln succeeded in eliminating at once the influence of international finance in the national financial affairs of the United States. All the bankers of the country, with the exception, of course, of some New York banking institutions, were only too eager to avail themselves of the opportunity of procuring national currency for business purposes by depositing United States bonds with the Treasurer of the government. Therefore for business as well as patriotic reasons they did everything within their power to induce their depositors to invest their savings in government bonds. And the large ownership by the general public of government bonds was bound to enhance both the thrift and the loyalty of the people. So the credit of the government with its own people became fortified to the extent of making it inviolate to the intrigues and manipulations of international finance.

"Lincoln's financial innovation was in every respect correct in principle. In war its application is limited only by the necessity of the country and by the capacity for work of the people. In peace it must be applied with such moderation as will best protect the steadfast growth of the country, the standards of living and the security of the savings of the people. Anyhow at the time its introduction made it a mere question of duration for the North to win the war. It assured the preservation of the Union of the United States of America.

"The Rothschilds perceived perhaps more quickly than any other concern the whole significance of Lincoln's masterful financial counter move. The backwoodsman had beaten these shrewd Jew bankers at their own game. Although they persevered in many dark and devious ways seeking to embroil him in foreign complications and domestic troubles, Lincoln easily spotted all their moves and checked them. And they got to fear him. Surreptitiously the Rothschilds bought up, principally through South German affiliations, large amounts of the new United States bonds so that they might have the chance when the time came to sit in at the new game.

"Of highest interest to me is the question how Lincoln if he had not been assassinated would have proceeded upon the conclusion of peace to keep the United States immune from the cabals and intrigues of Jewish finance. To learn this I have been studying lately his letters, messages and speeches, and reading between the lines I feel fully convinced that he had worked out in his mind a comprehensive plan the details of which he was too wise to divulge before the time was ripe for him to act.

"*'Capital is only the fruit of labor,'* is a truism he uttered in one of his early messages to the United States Congress. There was not one iota of abstract socialism about the make-up of Lincoln. To me it sounds like a declaration of economic independence, telling the world at large that the United States was not in need of any foreign capital to develop its resources. So behind this utterance there must have been in his mind a concrete constructive plan of making the savings of the American people the sole means of the economic development of the United States to the exclusion of any direct participation by foreign capital unless it were through the purchase of United States government bonds, which bonds could always be kept at a premium by being convertible into the national currency.

"Reasoning then along the line of his mental methods I conceive it to have been his intention to cause upon the cessation of war the organization of a new central national institution whose function it would be to direct impartially and disinterestedly the financial and economic affairs of the republic in a way which would banish forever the sinister intrigues of greed, give to the nation its harmonious development, and afford to the savings of the people all sorts of safe opportunities to share directly in the growing affluence of the country.

What Bismarck Feared

"LINCOLN was too farsighted a man not to see that the American democracy could not consistently endure if the economic development of the country was left to the discretion and mercy of concentrated wealth, of foreign financiers and of political and legislative powers who would all more or less put their private advancements above the common welfare. To neutralize their self-seeking endeavors an inner council with discretionary powers was needed, which council on a basis of co-sovereignty with the administrative and legislative bodies could exercise disinterested supervision of all monetary matters appertaining to the just distribution of wealth. In short, he realized the truth that a republic in order to be consistent needs like every other living organism a head, a stomach, and a heart. And to give an organic heart to the United States was Abraham Lincoln's great intention.

"The inner financial circle of Europe was itself well aware of the high intention of Abraham Lincoln. It knew further that the great love of the American people and their full confidence would give Lincoln the power to consummate his plan, and that the fulfillment of his plan would spell the downfall of Europe's capitalistic control of the world. So by the dark inner council the death of Abraham Lincoln was decreed. It was an easy matter for its hirelings to incite the half-witted actor to commit the actual deed.

"In the death of Abraham Lincoln Christianity has received its greatest setback. In the United States there was no one big enough to step into his shoes. The unholy money game of Israel is again in full swing in the new world. I am fearsome that the Jew bankers will acquire with their crooked financial cunning complete control over the exuberant wealth of America and will use their ill-gotten gains to corrupt systematically our modern civilization. They will not hesitate to plunge all Christendom into war and chaos it it will further the end of 'Israel inheriting the earth.'"

There were more talks from time to time by Bismarck to me dealing mostly on the work he proposed to do for the unification of Germany's economic structure to assure its independence and its immunity from the sharp practice of international finance and the perturbations in business caused by the lack of the proper co-ordination of the industrial and commercial pursuits and activities of the people. On the whole my mind was as yet too immature fully to digest his

A Glance at Guatemala

By AARON HARDY ULM

"I HAVE been writing a little memorandum with reference to an editorial I saw in one of your big eastern newspapers," said Dr. Julio Bianchi, minister from the Republic of Guatemala, at the modest but attractive Guatemalan legation on Ontario Road in Washington. "The editorial bears on a suggestion that, in case of the United States barring immigration, industrious Europeans might find Guatemala a good haven. The writer of the editorial doesn't agree with the suggestion, saying that all good land in Guatemala is held by big landowners and is cultivated in the form of gigantic plantations, and that outside workmen can't compete with native labor.

"There is an element of truth in what he says. But he will be surprised when he learns that land which will produce indefinitely two and sometimes three crops of corn a year may be purchased in Guatemala for $1 an acre or less.

"What Guatemala needs most are small farm operators. Immigrants with industry and a little capital can get started easily there and be assured of a comfortable living, and good profits. We are not yet in position to take care of many immigrants who come as laborers, for the native population provides a big supply of cheap labor. What we need are persons who can work for themselves and not have to work for others, people who can use our native labor in small operations.

"My country is one of many opportunities, which under the new and liberal régime now in force are going to be made available."

The new Guatemalan minister came to this country on behalf of the new government that less than a year ago succeeded Cabrera, who for nearly a generation ruled the country virtually as a dictator. Dr. Bianchi is a physician by profession. He is a highly educated man, both generally and professionally, and speaks perfect idiomatic English, though he never studied outside of his own country. He is one of the leaders in the Unionist party which had most to do with overthrowing Cabrera. Hence he is an enthusiastic supporter of the new régime. Second to that he is enthusiastic for the movement that gave name to his party, the proposed and now all but crystallized United States of Central America.

Scenically, Guatemala is one of the most picturesque lands in all the Americas. The above is a view of Antigua, looking toward the volcanoes of Acatenaugo and Fuego.

"I am confident that sentiment in all five of the countries with independent governments in Central America, is for the formation of a federated government, somewhat on the order of your own United States. I am sure that 90 per cent of the people in Guatemala favors the movement which has long been advocated in all the countries and, I believe, favored by a majority of the people."

"Then why hasn't it prevailed already?"

"Well, many officeholders wouldn't be as important in the federal government as they are now with five governments providing high places for ambitious men. But the change will be made and, I believe, soon, for it is necessary to the full development of Central America which by race and geography is a single country.

"News reports indicate that agreement has been reached between all the governments except that of Nicaragua. When federation is accomplished you won't have to think of Central America solely in terms of a bunch of little republics but as one big nation extending from the Isthmus of Panama to Mexico."

Panama, it seems, is not included in the proposed federation. This is because in the past it was nominally a part of South America.

"With the federation accomplished, Central America as a whole will move forward with great rapidity and soon become one of the strong units in the group of Americas," said the minister. "Without regard to that, however, Guatemala is in the beginning of an era of great progress. The economic situation is confused by circumstances dating into the past but steps toward clearing it up have been taken.

"Sixty years ago, civilization in Guatemala was confined to the capital city and one or two towns. Knowledge centered in the church and the monastic institutions, natural resources were virtually untouched, and cochineal, grown by a few rich men and well-to-do farmers, was practically the only export from a land suited to the cultivation of a wide variety of products and well off in mineral wealth also.

"Home industries supplied most of our needs, and exports were larger than imports, leaving a small surplus in our favor. Then aniline dyes were discovered and the price of cochineal dropped very low, upsetting the financial balance, and causing a revolution in the economy of the country.

"The growth and exportation of coffee was fostered to offset our losses in cochineal. Great progress was made in opening large tracts of land to cultivation, highways were built and schools established. High prices for coffee enabled the people to buy foreign goods and our home industries were smothered by imported products with which home manufactures couldn't compete.

"Then came a serious drop in coffee prices. Growers were forced to borrow large sums of money abroad, chiefly in Germany. The loans were obtained under contracts that virtually amounted to the advance sale of coffee crops at prices fixed by the purchasers. Freight rates were raised and the depression in the price of coffee continued. Our growers vainly sought extensions of time and when unable to honor drafts for balances due they were pitilessly persecuted. The little gold remaining in the country was exported in a futile effort to maintain balances; the exchange rates rose and at last our finest estates passed into the hands of foreign creditors. Thus began the régime of 'absentee landlordism' in Guatemala.

"In the late eighties a series of disasters carried our government to the verge of bankruptcy and caused it to adopt policies that produced the most serious problems that must be solved by the new administration. Nominally we had a gold standard but silver was the only metal used as money and there was a steady fall in the value of silver. Deciding against a foreign loan, the government applied to the home banks for the funds it needed and, to protect the banks, made, as an emergency measure, their banknotes irredeemable. This emergency measure, intended to remain in force for a period of only six months, has been in force for the last quarter of a century. Cabrera came into power in 1898 and held control of the government until less than a year ago. Our new government, composed of the best men in the country and backed solidly by public opinion, faces some very difficult but not discouraging conditions.

"Official statistical reports show that Guatemala is in a satisfactory and flourishing condition. Exports have greatly exceeded imports during recent years, leaving a substantial surplus every season. However, one-third of the coffee exported, one-fifth of the sugar, practically all of the bananas, and all income from railroad and electric power companies belong to absentee owners and never come back to the country as money. Hence about forty per cent of our export trade is fictitious and the international balance of trade is, and has been for years, against us. Money is scarce, interest on loans prohibitive and exchange rates go higher and higher despite all efforts to check them. Gold coins left Guatemala in 1885, silver pesos in 1899, silver reales in 1905, nickel in 1915 and copper coins in 1918, the copper for some time having been worth more as metal than the face value of the coins.

"Our six independent banks have issued a total of about 360,000,000 pesos in unredeemable bills, representing at the present rate of exchange approximately $9,000,000.

DR. JULIO BIANCHI,

Minister from Guatemala. His father, a native of Switzerland, lived in this country before settling in Central America. Before becoming a diplomat, the minister was one of the foremost physicians and surgeons in Central America. He is a staunch advocate of the formation of a United States of Central America.

"For several years all important business has been transacted in American gold and interest rates on American currency have been as high as 18 per cent a year. There is in actual circulation more than $1,000,000 of American money, and this sound money undoubtedly has been of substantial help to us.

"The new government employed Mr. E. Kemmerer, of Princeton University, to make a survey of the monetary situation. He has made a valuable report and his suggestions, based on establishing a sound gold standard, I believe will be carried out. Two American banking firms have representatives there now seeking a charter for the National Bank of Guatemala proposed by Mr. Kemmerer.

"Adoption of a gold standard and a better banking system are necessary before much progress can be made in developing Guatemala's rich resources.

"We need foreign help in the form of men and capital. I am willing to state that my government will welcome every clean man wishing to go to Guatemala or to invest there. Within the next ten years we should be in position to take care of a half million settlers of the immigrant type.

"We need immigrants to exploit the almost unbelievable wealth of our land. We have millions of acres of rich soil, covered with tropical forests of mahogany, cedar and soft woods, awaiting the hand of man to be turned into rich pastures, fields of sugar cane, cotton, which grows 10 feet high, and fields of corn. We produce rice, grapes, fruits of a hundred varieties, bearing in all seasons; and in the foothills and highlands we have the most wonderful climate and scenery to be found in all the Americas."

Dr. Bianchi is authority for the statement that such heat as we often know during the summertime in all parts of the United States is foreign to the climate of Guatemala. Even in the lowlands of the coastal plains, where about the only true tropical heat is known in Guatemala, the temperature, he says, has never been known to go above 100. In the plateau and mountain regions, which make up the greater portion of the country, the climate closely approximates eternal springtime. In many of the communities high above sea level the thermometer ranges in the forties and the small fifties throughout the year, but frost is never known.

A railroad runs across the country from the Atlantic to the seaboard, with a few branch lines or connections running in other directions. The railroads are owned by Americans, and one-half of the men employed in operating them are from the United States, says the Guatemalan minister. The "American colony" there is a large one, there being between 10,000 and 20,000 foreigners all told in the country.

The indigenous population of about 2,000,000 is about 70 per cent pure Indian, the remainder being whites, chiefly of Spanish origin and mixed. Illiteracy is high, especially among the pure blood Indians, who, the descendants of the ancient Mayas and Quieches—peoples that had reached a fair stage of civilization when America was discovered—are intelligent and docile.

The new government, says Dr. Bianchi, is considering measures looking to the education of the natives, the first purpose being to establish a school in every town or village with 500 or more population. Nearly all of the Indians speak Spanish, but the native languages are still remembered and used by some.

"Because of the democratic and sensible changes in Central American politics, brought about in recent years, I believe the era of revolutions and petty wars is ended," said the Guatemalan minister.

"Every man in our government today is willing to give the very best of his body and brain to his country whether the country be Guatemala alone or Guatemala

(Concluded on page 12)

Guatemala must be a good place for children; for evidence of that fact note the picture of Dr. Julio Bianchi, Minister to the United States, with Madame Bianchi and their eight children.

A Glance at Guatemala

Concluded from page 11

incorporated with sister republics in the United States of Central America, as we hope to see her in the near future. With political and legal activities giving full and unquestioned protection to man and money, the capital we need will come in safety from foreign lands, our international trade will be what it always should have been and Guatemala will be the best place in the world in which to live. I have implicit confidence in the men now governing Guatemala and in the future welfare and prosperity of my country."

Dr. Bianchi says that the bulk of Guatemala's foreign trade is now with the United States. This is due in part to the fact that the bulk of it is carried in the ships of the United Fruit Company, which also controls the Guatemalan railroad lines. There is room for great expansion in trade between the two countries.

And it may be worth while noting, on information given by the Guatemalan minister, that the transcontinental railroad line, long the dream of big builders, will soon be an approximate fact. With construction now under way for linking the railroad system of Guatemala with that of Mexico, it will be possible for one to travel from New York or Chicago to Guatemala City and even beyond—but not quite to Panama—by railroad alone. The link will be finished in a short while—in fact, it amounts to little more than the construction of a big bridge. Continuous telegraph lines now link this country with Guatemala. In fact, it is possible to send a message by overland wire from New York City to Panama.

Because of their peculiar situation and their smallness, the Central American republics, more than any other of the Latin-Americans, have been and still are what might be termed the special pets of the United States. A large proportion of their trade has been with this country, which has taken great interest in their internal and foreign affairs but always in a friendly way. Much American capital is invested in the several Central American republics.

Central America isn't as remote as one on quick though, might imagine. New Orleans, for example, is approximately the half-way station from New York City to Guatemala City. The distance from our big Gulf port to the Guatemalan capital is only 900 miles.

While our government is taking no hand in the matter, it probably looks with favor on the proposed formation of the United States of Central America. The success of the proposal would simplify our relations with Central America, for it would mean a stronger government for that region and hence one less likely to cause us trouble. We would then have to deal with only one government instead of with five as at present.

Abraham Lincoln Eulogized by Bismarck

Concluded from page 10

teachings. Perhaps for that very reason they impressed me more vividly, were preserved and staid unimpaired in my memory.

In later years I realized that it must have been for Bismarck a time of great stress. The rebuff he had received at the Berlin Congress must have given him the measure of his limitations. He had felt the heavy hand of the super-money power. He knew it was there in all actuality, and still he realized that it was too imponderable to be met by force. It would never come out to fight in the open but would keep on lying like a shadow over all his work.

To release Germany out of the gloom of this overshadowing money power became his obsession. As a practical man he knew that this could not be done with ranting or preaching, by denunciations or legislative actions, but must be accomplished along such voluntary lines of actual organization as would gradually bring unity to the economic affairs of Germany and place all business upon an actual basis of mutual good will.

Bismarck was not a man to carry his heart upon his sleeve, but to me, the boy, he revealed himself to be full of human compassion. He was forceful and dominating but there was in him no lust for power for the sake of power itself but just for what might be accomplished with the help of power. He had very little patience with pretenders or dreamers who thought they had a panacea for the woes of the world. Socialists he regarded largely as the witting or unwitting hirelings of the Jew money power that finds good fishing in waters troubled with half-truths.

His ambition was to ameliorate the economic conditions so as to abolish pauperism by giving steadfast work to the people. Make conditions right and relieve the people from worries for their daily bread and God will do the rest, was his creed, which after all is profound common sense and the fundamental of Christianity.

He was altogether too broad a man to harbor race hatred or religious prejudices. His abomination was solely of the persons who seek profits by trading upon the ignorance, misfortunes, or vices of their fellow men. Such profits, he declared, all went ultimately to swell the coffers of the super-money power that was playing the international game by making puppets or tools out of kings and statesmen and was turning every disturbance of the peace upon the earth to its further pecuniary advantage.

To me, the boy, he was exceedingly kind. What his idea was in teaching me I can surmise only that he was preparing me for a certain task. I had shown traits of originality and had been a good scholar but at once the delight and the despair of my teachers. On their recommendation, it had been concluded for me to take the university course on political economy, and undoubtedly it was Bismarck's intention to help me in my career.

But I was headstrong by nature, and there was in my make-up a certain amount of non-conformity. The very talks of Bismarck had served only to disturb my mental balance. I felt unsettled, and I had a strong desire for travel. I persuaded my father to let me go on a visit to the United States. Here I struck out for myself but did not fit in well in the American hustling for money. So I drifted from place to place, meeting with much kindness by the wayside, until I found myself at Pt. Barrow, Alaska, among the Eskimos, when upon the top of the world I found peace and time for fearless contemplation of the joys and vicissitudes of human life upon the earth.

Somehow I feel compelled to give to the world my boyhood recollections at this time when all who walk may read that Europe's capitalistic control of the world has passed away beyond all resurrection. The American people have been asked to help in reviving the corpse under the semblance of a league of nations. Their strong intuition has prevented them from doing so. Still the fate of our civilization demands some concrete action. Therefore, it may be well at this perilous time to hark back to the wisdom of Abraham Lincoln.

The Wood Hollow Papers

By ROBERT PAGE LINCOLN

THIS morning I discovered a newcomer in the neighborhood, of whose presence I have long been conscious. He has given me strange music of nights but I had never seen him with my naked eyes. It chanced that I was walking down the road that passes the house. Some one hundred and twenty feet from the door stands a great elm with a hole in it midway to the top. Looking up into the tree I noted the cavity and in the doorway sat none other than a screech owl, bag and baggage, and he needed only the proverbial children's book glasses upon his beak to assure me beyond the scintilla of a doubt that he knew all there was to know about this world and even the next. It is this same screech owl that visits around the trees about the place when night draws his purple damask over the land. On such occasions he gives voice to his feelings in mournful, plaintive-keyed tremors that recall ghosts with perfectly white bed-sheets over them, or hobgoblins and other folks; not to forget dwarfs and sylphs, whatever they may be. Just what are his deeds in the hours of darkness I do not know but if I am not mistaken he is the same identical fellow that has "hung around" the suet chunks I have nailed and bound to the trees about the place. I do not wish to issue a sweeping accusation to that effect but must say, as the newswriter, that "an alleged owl has been busy in the neighborhood."

Anyhow, someone—I will not say who—in nocturnal hours appeared before said suet and gouged out appreciable chunks that could certainly not have been done by the bill of a tiny woodpecker, let alone a titmouse. So there he sat in the cavity, surrounded innocently by his feathers, rigid, sentinel-like, staring outward with glassy eyes—though I knew from the way his head turned as I moved forward that he was seeing me *with his ears*.

The doleful cry of the screech owl, *Megascops asio*, penetrates to one's marrow. It is dismal beyond words. I have lain in a lean-to in the wild northern woods and heard the wolf-pack on the trail of a wounded buck, yet the awfulness of those cries is no more provocative of shudders than the "screech" of this little owl.

There is that about an owl that stimulates in me a certain sense of wonder. By some hocus-pocus, mesmerizing system he rules the woods, falling upon birds and mice as they show themselves, but mostly making life for the field mice and even barn rats one of constant watchfulness in the name of self-preservation. Undoubtedly owls are among the most dreaded creatures of wood and fen. They may be destructive at times in that they *may* kill birds, but that they are surpassingly beneficial in the good that they do in killing vermin can never be belittled. Locate an owl's nest, winter or summer, and you will find therein evidence of the great mouse and rat forage that is carried on, and this is singularly true during the nesting season when they harry the field mice numbers relentlessly, bringing them in with mechanical regularity. How they do it the Lord only knows. But that is their life's work and that they are proficient in their calling goes without the saying. When an owl has its victim in its grasp it swallows it as it is, if it can do so. He does not stop to pick out the bones or eliminate claws. He lets the "inner man" do that for him. By a rotary movement of the stomach the flesh and edible portions of the victim are disposed of, assimilated, and then up comes what cannot be made use of, bones and all. This is ejected from the mouth in a ball-like affair which we know as "pellets." It is by studying these pellets that we learn beyond a doubt what is the food of the owl.

So long as the owl destroys field mice and other creatures detrimental to the welfare of man, and in fact to all life, so long is the owl a positive value to man, and since all owls are more or less destructive in this sense they should not be killed. Every owl in a neighborhood is of a decided worth and to eliminate that life is but to help along an increase in vermin that is so hard to keep down. As though everything in nature is laid out by purpose and design so does the hawk skim over the fields by day to seize the mice as they show themselves while the owl is hiding in the woods, its eyes unfitted for day work. But when dusk comes on and the hawk has gone to roost then the owl comes into his own and its night-wise eyes are aware of everything that goes on along the face of the earth.

Is it not remarkable when you think of it, the purpose in everything, and these birds for instance? Here is one that works through the coverts and the fields by day while another is unfitted for such action, but is provided by nature with eyes for seeing in the dark, for it is then that the vermin that have been in close concealment in the day hours come forth, content in the belief that they will then be unseen. But like a shadow detached from the sable wings of night there sails down, as noiseless as a leaf, that merciless one keeping the vigil and another mouse has gone the way of his kind. In just this manner is kept at poised level the inevitable natural law of balance and proportion. Unless they had their enemies both by night and by day the mice would increase beyond all reckoning.

Is the Battleship Obsolete? The British Ask

By W. P. CROZIER

Manchester, England, January—(By Mail).

THE United States is building capital ships—battleships and battle cruisers. Japan also is building them. England has not laid down any since the armistice. Such ships now cost several million pounds apiece and, if built at all, would probably be built in squadrons of four. We are already groaning desperately beneath the burden of taxation at the very time when we are in the trough of trade depression. There is a strong movement afoot for state and personal economy. The estimated government expenditure for this year is £1,200,000,000 and for £800,000,000 in any "normal" year, whenever that may come. It has already been proposed in the House of Commons that the government next year should be restricted to the "normal" expenditure of eight hundred millions and the government retorts that if such a limit were imposed it would not be able to provide for the defense of the country on the sea, on land or in the air.

From all this it will be evident that this country is far from desiring to embark on a program of battleship construction—one uses battleships as a convenient term to include battle cruisers—because the present taxation is grinding down the middle classes and hampering industry, and a battleship program means an addition to taxation of many millions. Of course, if the admiralty and the government say deliberately that post-Jutland battleships are necessary, the country will provide them whatever the cost, but at the moment we are not sure that they are necessary. It is a strong point that both the United States and Japan are building them, for only a very foolish man would suggest that those great powers are doing anything but applying promptly and betimes what they hold to be the unquestionable lesson of the war—that the battleship is still, despite airplane and submarine, the ultimately decisive weapon on the sea.

To tell the truth, there is no doubt that the major opinion of our own sea lords at the admiralty believes the United States to be right. "Let it be granted," they would say, "that airplanes and submarines have incalculable possibilities in them and that we do not know what they may or may not achieve at the beginning of the next war. Nevertheless, we are not concerned with the outbreak of a war at some dim and distant date but with the conditions which would prevail if a fresh war were to break out next month or next year and, on that hypothesis, we maintain that the country possessing the superior battleship fleet would control the seas and win the war."

On the other hand, there is in England a section of sailors and airmen who had long and active experience during the war, which holds very strongly that the day of the battleship is over, that it can achieve little or nothing in the next war; and that our available funds will be spent to much better purpose on great swarms of small craft—airplanes (and airplane carriers) submarines and torpedo craft of every sort. Now the ordinary citizen, being disappointed so far of all hope of disarmament, will pay what he is told by his betters he ought to pay for naval defense. But emphatically he does not want to pay another fifty or a hundred millions for battleships unless his betters are quite sure that these are the right thing for the purpose and, learning from the controversy that is now raging here that his betters are far from being unanimous, he is relieved to learn that the government, before taking its decision, is laying the whole question before the Committee of Imperial Defense—which means the most important cabinet ministers advised by the chief military and naval authorities that we possess. If the committee summons before it the sailors who do not believe in the battleship—Lord Fisher was their prophet and chief, as Sir Percy Scott is now—then we shall at least have some security, even if at the finish we do build battleships, that our money is not being wasted, and that our safety is not thoughtlessly endangered.

One word about the battleship programs of the United States and Japan. Public opinion here does not disquiet itself about either the one or the other. Of course the Pacific is a remote ocean to the Englishman. The "menace" of the French fleet a hundred years ago and of the German fleet in the years before 1914 was close and insistent and the Englishman never for one moment allowed it to escape his mind. But the fleet of Japan does not worry him, although he has no comparable force in the Pacific wherewith to meet it and Lord Fisher prophesied openly that the Pacific was the battleground of the next war. (Singapore is now held by this school to be the great "strategic center" for England.) The average Englishman (unlike the Australian) does not think of Japan as an aggressive, threatening power in the Pacific, but if he did he would probably come to the conclusion that there was one country which was much more competent than his own to handle the situation—I mean the United States.

The American Navy excites in the Englishman as yet no envy and no hostility. Whether rightly or wrongly, it is now accepted as a commonplace here that there neither are nor will be any differences between England and America which could lead to war. We do not regard such a thing as coming within the bounds of practical politics. The ordinary man expresses this point of view by attributing the American naval program broadly to the necessity of keeping an eye on Japan and the future peace and freedom of the countries fronting on the Pacific Ocean. This is not, I imagine, by any means an adequate appreciation of the motives of American policy, for Mr. Wilson made it clear long ago that the America of the future, failing all other remedies, must have a fleet sufficient to protect her own interests, as representing those of all neutrals, against the encroachments of belligerents in a great war. One of his objects at Paris was to establish firmly the "freedom of the seas" (which the Germans always said had been suppressed by British "navalism") and he only abandoned his plans when, as he said himself, he discovered that in a comprehensive League of Nations there would be no neutrals whose interests could be injured by the belligerents, for there would be on one side the offenders against the Covenant of the League and on the other, vindicating its authority, the whole of the remaining members of the League.

But while we are sure that at any rate we shall not build against America, League or no League, our trouble is to know what sort of ships we are to build. What are the principal arguments against the battleship? The first is that submarines will increase so rapidly in size and speed and armament, that before long they will be not submarines but large submersible cruisers, armed like a dreadnought and able to cruise round the world. They will be able to fight a battleship from under the water, but the battleship will not be able to fight them; when it comes on them and seeks to open battle, they will submerge and disappear. They will be much more formidable than they have ever been because already they are beginning to make use of wireless when submerged—which they could not do in the late war—so that they will shortly be able to concert plans with one another and receive instructions and information while still concealed beneath the water.

Our Admiral Sturdee, who defends the battleship, inquires scornfully whether any other ships could have sunk Von Spee and his squadron as he sank them with his two battle cruisers at the Falkland Isles. "Pooh!" say the anti-battleship sailors, "that was all very well for the last war, but when the next war comes, a Von Spee would simply submerge with all his ships and of what use, pray, would your battle cruisers be then? They would wander helplessly on the surface of the waters until Von Spee destroyed them. The only weapons that in the next war will be of any use against raiding cruisers like Von Spee's will be the airplane and the fast submersible." They might add that even these weapons will be of limited value in the vast spaces of the world's seas and on their endless trade routes. The Sydney sank the German raider Emden. But how long a life might the Emden have enjoyed had she had the power to submerge and reappear! For the submersible possesses the great twin attributes, which never change, of military success—power of invisibility and the power of effecting a surprise.

It is easy now to see the retort which these sailors would make to anyone who complains that other powers are building battleships and we are not. "Let them build!" is the answer. "Multiplying enormously our submarines and submersible cruisers, our mine-layers and airplanes, we shall pen their battleships in harbor or, if they come out, we shall assail them with all these weapons of ours from our nearest bases, wherever they may be. If our principal object is to protect our over-sea commerce, food supply and so forth, it is not their battleships that we fear, but their use of the same weapons that we ourselves possess—their submarines, airplanes and mines. We believe that we can develop the under-water and the over-water weapons to such a degree that we shall be able to regard the battleship as almost negligible."

But by many seamen here the airplane is rated even more highly than the submarine. They say that in a war between England and France no battleship would be left in a few days in a French port; that in a war between England and a revived Germany, no English fleet would be safe in any base from overhead attack. The enemy force would consist of flying-boats which could rest on the sea and rise up from their temporary base at the appropriate time or of airplanes which would be borne on "carriers" equipped with the maximum of speed. A modern naval base, to be secure, will need a roof. A fleet, to be secure against destruction, will need a great array of attendant airplanes to meet and beat off the attack. Even the most generous provision of that kind cannot absolutely guarantee security, for the deadliness of the airplane lies in its extreme mobility. The enemy can assemble large numbers secretly and quickly and throw them suddenly against any chosen point. They will effect a surprise by the swiftness of their coming and the numbers with which they come, whereas the strength of the defense will be for the moment a fixed quantity and the mischief may be done before the necessary reinforcements can be brought up from elsewhere. No, whatever may be said for the battleship, there is no doubt that wherever it is within practicable range of the bases of the enemy—and the range is constantly extending—it will be exposed to most dangerous attacks from the super-airplanes of the next age. That will be the case with all the great European powers. It will not be true to the same degree of the United States and Japan, which are separated from Europe and each other by much greater distances.

On the other hand, the advocates of the battleship have one great argument in their favor. They assert that during the late war the submarine never inflicted any loss on a battleship squadron steaming in formation and properly escorted by cruisers and light craft. That is true. There were reports of submarines at Jutland and elsewhere and of course a good many cruisers and old battleships were torpedoed on patrol or at anchor, but when the great battleship was in its full war paint, steaming fast with its due escort and protection, it was immune from injury by submarine. Nor was any battleship sunk or seriously injured by airplane.

The defenders of the battleship are entitled to make capital out of this immunity and it is not a very damaging retort to say, as the other side does, that the German submarines had orders to attack commerce and to leave the enemy battleships severely alone. The security actually enjoyed by the battleships was in fact so great that at the present moment it is reasonable to say that it can still stand up against its small assailants and therefore (in the case of England) that it can defeat any attempts at raids, not to speak of definite invasion. But could it do so in five or ten or fifteen years' time? Picture the harbor of Brest or Cherbourg assailed by hundreds of British airplanes or Portsmouth and Dover attacked by swarms from France! The position of the battleship would be—shall we say?—uncomfortable.

No doubt what will first happen will be a battle royal between the belligerents for the "control of the air," but control of the air is not to be so easily nor so definitely established as that of the seas, for the output of airplanes will be so rapid and enormous that supremacy will be partial and temporary and will pass from one side to another. Of one thing we may be certain, that in countries whose harbors are comparatively close to one another—that is, who can "get at" each other—the battleships of the future will eventually have to have the power of protecting themselves: they will have to be submersible. That may very possibly prove to be true of the ships of all powers, however remote.

It is a discouraging business, this of speculating only about types of warships, as though the old world were unchanged and unchangeable, as though we looked forward still to the "inevitable" wars and the endless competition in armaments which accompanies them. Americans may say that Europe at least shows few signs of change of heart and that America cannot be blamed if she frames a policy that befits the war-spirit of the conquering states of Europe. True, and yet there are many in Europe who are waiting for some power to make the appropriate gesture, to propose boldly a measure of disarmament. It could be done now and it could be done by any one of the great powers that believes with sufficient sincerity in the idea of a peaceful community of nations. It is not opportunity but will that we all lack. Of course the proposal might fail. But better to have tried and failed than never to have tried at all. And indeed the effort would not be lost, but would be taken up again and repeated with a more powerful moral appeal. Has Mr. Wilson a successor in the United States, or elsewhere?

Teaching a City How to Play

ROWLAND HAYNES

His is the job of teaching all of Cleveland, Ohio, which means school children, young people, grown-ups, even the grandfathers and grandmothers of that city how to make the most of their recreation hours, and such a task cannot be accomplished in a few months. Mr. Haynes has a ten-year program mapped out. By the end of that time he expects Cleveland to have started on its career of play, to be a model for all other cities in the United States. The picture shows Mr. Haynes and some of the kiddies he has inspired with the play spirit.

The Crime of the Cities—Chicago

By CARL S. LOWDEN

IS THERE any crime wave in Chicago? How did it get there? What's keeping it? These questions are not easily answered. Certainly widespread vitiation exists along with impairment of the machine for disciplining lawbreakers. There is confusion, duplication of effort, inefficiency.

Why?

"The illicit handling of liquor," says Attorney-General Edward J. Brundage, "has been corrupting every force in the community, and the vilest of concoctions have been sold at prohibitive prices."

Henry Barrett Chamberlin, operating director of the Chicago crime commission which is the business men's own bludgeon for the reduction of lawlessness, stoutly maintains that there is no crime wave in the city. "We have been told," he says, "that the crime situation is an emergency demanding attention. It is not. Crime is an established business here. It has been centralized, organized, and commercialized."

Chamberlin quotes figures to substantiate his contention. In a comparison of 1919 with 1920 he points out that murders decreased fifty-one per cent, burglaries were reduced by ten per cent, and robberies show a falling off of six per cent.

As a matter of fact, if automobile killings be combined with the murder figures, the result is startling; for the entire complexion of the situation changes markedly. The decrease becomes an increase of eighteen per cent.

President Edwin W. Sims of the crime commission also dwells upon the murder record. For each million of population Chicago loses an annual 112 by violence, whereas Canada loses thirteen and Great Britain only nine. Because the thefts, burglaries, and robberies totaled 13,466 in 1919, Chicago now has the highest burglary insurance rate in the entire United States.

Neither Chamberlin nor Sims struck at the root of the crime menace. Business men are careful, cautious, and shrewd; they know the value of the dollar, and they do not desire to give any offense that may react upon them. Is that the reason, I wonder, why "moonshine" and bootlegging and the traffic in liquor are often winked at?

The crime commission praises Chief Charles C. Fitzmorris as "one of the best heads of the police department Chicago has ever had." Mayor William Hale Thompson appointed Fitzmorris last November tenth and gave him a free hand; since that time the new chief has weeded out thirty-four men and put the entire department on its toes. He has instituted a drive on crime, not on "hootch" which is the great contributing cause of the deplorable lawlessness in this city but upon crime itself. He avers that every recent crime of importance was committed by persons crazed with drugs.

There have been sundry rumors that the city police department is not wholeheartedly fighting the liquor traffic. The Prohibition Enforcement Bureau, the Federal organization, is not much more than a skeletonized machine. It has a big job on its hands. It has four states, Illinois, Indiana, Michigan and Wisconsin, to watch over; and it has a wofully inadequate supply of men at its headquarters for Chicago alone. The intent of the prohibition amendment to the Constitution included the idea of co-operation. Apparently the Federal forces are going it practically alone in Chicago.

Frank D. Richardson, prohibition commissioner for the four states, says the accomplishments of the first year under the Eighteenth Amendment have been satisfactory in view of the smallness of their forces. The arrests numbered 4,481; 50,000 gallons of bonded spirits valued at three and one-half millions and fourteen hundred stills were destroyed. Richardson is pleased by the reduction in the number of disorderly conduct cases from 36,633 in 1919 to 32,305 in 1920.

The foregoing figures are encouraging. But Ralph W. Stone, prohibition agent for Illinois, handed out some figures of the other kind when he said that two and one-half millions of *spiritus frumenti* blanks had been issued to doctors in eight months, thereby releasing about 200,000 gallons of liquor. He thinks that approximately seventy-five per cent of this was used as a beverage. In fact, he attributes the greater part of the bootlegging in Chicago to the abuse of the prescription system by physicians and druggists.

In the past the permits for the removal of liquor from the warehouses could be issued by Stone or by Richardson. They have now taken steps to amalgamate their offices in order to keep a double check on and to reduce the outflow of permits. Much of the liquor taken out on permits never reaches the supposed destination. The loaded trucks are diverted to cabarets, restaurants and soft-drink houses, which the newspapers and the sophisticated citizens openly call saloons. Mayor Thompson avers the Federal people are largely responsible for liquor sales inasmuch as they handle the permits. Certainly the whole permit system must be revised if the Eighteenth Amendment is ever to have any real meaning in this city.

At Richardson's office I was told that most of the "moonshining" must be attributed to foreigners. When pressed for further information on the identity of these violators, an assistant in the office named Greeks, Slavs, Serbs, Russians and Italians. Many of these are Jews.

"Of what nationality," I asked, "are the liquor dealers in Chicago?"

"About ninety per cent of them are Jews."

"That much?" I queried doubtfully.

"Well," came the answer, "I'll say, conservatively, seventy-five per cent."

It is against the law to make public the names of liquor dealers. When arrests are made, however, the names appear in the newspapers. From one such list I extract, as a sample, the names beginning with the letter S, as follows: Sabatello, Sambur, Sass, Sbarboro, Schafer, Schillaci, Schoene, Schultz, Schwenck, Schermack, Shoop, Silverman, Sirovatka, Smeja, Soens, Soldewish and Sommerfield. Some of the foregoing are noticeably Germanic.

At the office of United States Attorney Clyne I was informed that Jews constituted eighty per cent of the wholesale liquor dealers in Chicago. As I could not get a glimpse of the list, I am not prepared to say how accurate either of these estimates is; I could not verify them nor ascertain whether there had been any under or over statement.

None of the officials I visited seemed to think that crime is definitely organized in this city or that there is any organized opposition to the Eighteenth Amendment. The United Societies was pointed out as an alliance of liberals anxious for the legal restoration of liquor; they try to influence public opinion by means of wide distribution of their official magazine, "The Champion of Fair Play."

The fight against illicit liquor does not make as much progress as it ought. In 1920 injunctions were asked against 150 cabarets, cafés and other liquor-selling places that were alleged to be public nuisances, but only seventeen were actually closed. Such success is a bit discouraging.

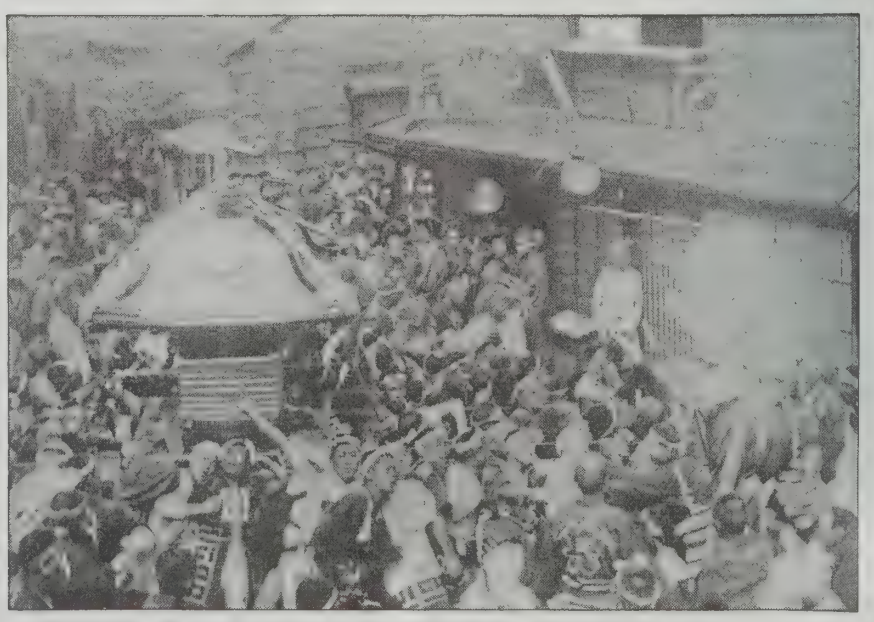
"All that I can do," said Judge K. M. Landis in granting one injunction while refusing to close the property, "is to restrain this man from continuing the nuisance complained of. I cannot close his place by this injunction. I have no idea this will have any effect, but it is the only thing I can do.

"I believe everyone here will realize that violators of the Volstead Act will have a run for their money in this court. But with the whole dictionary at its disposal, Congress has specifically stated what I can do, and I must do it. Whatever I might want to do personally is restrained by the wording of this section of the act."

Landis is the nightmare of Chicago's "booze" lawbreakers. He rules with as heavy a hand as the provisions of the Volstead Act will permit. On the fifteenth of January, 1921, he gave two men the limit of a year's imprisonment and a fine of a thousand dollars each; other sentences were for three months, six months, one hour; one man was fined two hundred and another ten dollars.

Hundreds of cases are now pending in Judge Landis' court. The mills of the law grind slowly. Some of these cases will be dismissed, others forgotten, witnesses will be gone or spirited away when certain cases come up: many of the guilty will escape from one cause or another.

Judge Landis recently instructed the prohibition agents to "go out and get the big fellows—the brewers." January 25 three brothers owning one brewery were arrested on a charge of manufacturing and selling beer with an alcoholic content in excess of 1½ per cent. The case has not been tried, but prohibition agents say they are preparing to act against the heads of other breweries.



The Federal bureau also believes that 2,500 saloonkeepers violated the *wartime* prohibition. Squads are said to be out gathering evidence against these men. If this blow actually develops, it will hurt the liquor traffic.

The officials declare that wholesale dealers have been implicated in 1,800 state and government liquor cases. Approximately one half of these are Chicago cases. These figures are significant in view of the fact that three fourths of Chicago's wholesale liquor dealers are Jews.

Chicago is one of the wildest and wettest cities between the Atlantic and the Pacific oceans. Is it wild because it's wet, or wet because it's wild? I can't, answer the conundrum. The present drive apparently has not greatly lessened crime. Perhaps a drive against grafting politicians and the locking up of the friends of criminals would be more effective. There is still a mountain of crime in Chicago, and the law-enforcing bodies are moles beside it.

Japanese Customs That Are Different

CELEBRATING NEW YEAR'S DAY IN JAPAN

Before the days of prohibition big cities of the United States used to be able to exhibit some pretty joyous celebraters but none of them ever exceeded in abandonment this merry throng of young Japs attired in their native costume and bent on getting every ounce of enjoyment possible out of the festival. "We Won't Go Home Until Morning" is expressed in the attitude of each and every one.

(C) Gilliams Service

ADVERTISING MOVIE SHOWS IN JAPAN

This interesting photograph shows a street in Tokyo, entirely given up to motion picture theaters. The curious looking signs in front of the buildings are advertisements of the throwers to be seen inside.

The Three Arts

Agriculture — Manufacture — Transportation

Montana has joined the American Farm Bureau Federation. Only six states now remain unrepresented in this young giant among the farm organizations. Three of these are expected to vote affiliation in February.

The government of Mexico proposes a specific export duty on petroleum instead of the 10 per cent ad valorem rate in effect at present. The result will be a considerable advance in the duty.

The Tientsin-Pukow Railway is to purchase 11 block-steel car trains of five cars each, including sleepers and observation coaches. The company is also considering the possibility of purchasing car ferries for use between Pukow and Naking, on the Yangtze River.

The Bureau of Crop Estimates is endeavoring to weld all public agencies concerned in the marketing and production of agricultural products into a co-operating group, for the purpose of using the information collected to better advantage.

Coal dealers are vigorously attacking the Calder Bill for the regulation of the coal industry. They insist it will cut their profits down to one or two per cent.

A publishing house proposed to print the United States Pharmacopoeia in Chinese. It is felt that this would be of great advantage in developing the American drug and chemical trade in China.

The Bureau of Markets of the Department of Agriculture is studying the question of establishing standard celery grades. Most celery is now shipped in the rough.

The Federal Trade Commission has ordered American firms to cease the importation, distribution or sale of Japanese-made matches in boxes bearing Swedish labels.

Mexico has signed a contract for a credit of $5,000,000 to be spent in purchasing railroad equipment.

The Department of Agriculture urges those farmers sowing foreign-grown clover seed this winter to use great care in selecting this seed.

Production of coal in the United States has been declining rapidly since the first of December. The moderate winter and the condition of industry are said to be responsible.

The Geological Survey has discovered that unscrupulous promoters of fraudulent mining schemes frequently claim connection with the government service. It warns the public against fake stock promoters who are using this subterfuge.

The 1920 census reports credit Rhode Island with 4,083 farms, a net loss of 1,209 farms in 10 years.

American manufacturers of agricultural machinery are reported to be meeting severe competition from German firms in Italy. The German manufacturers have, it is said, been able to reduce their price to a point considerably below that at which deliveries can be made from this country. The increase in Italian duties on farm tractors has made it possible for a farmer to buy two Italian machines for what he would pay for one American machine.

The Chilean Congress recently authorized a bill for loan on behalf of state railways and arrangements have been made to borrow $25,000,000.

Mexico, which for many years exported live stock to the United States, is now buying meat in American markets.

The efforts of the government to encourage the breeding of better cattle is meeting with excellent results. Records show that 2,078 persons, owning approximately 232,322 head of stock, have agreed to use only purebred sires.

The Department of Agriculture has determined, after a complete series of tests, that sugar substitutes, dextrose, cerelose or refiner's sugar can be used successfully in the place of cane sugar in curing hams or bacon.

A slump in excess profits taxes was chiefly responsible for a slump of $300,000,000 in the Federal taxes collected during the first six months of 1920.

The Swiss Federation of Paper Manufacturers has decided to reduce the price of paper 30 per cent.

The Bureau of Markets estimates the amount of wheat in the United States, January 1, 1921, at 320,000,000 bushels.

The foreign trade of Japan showed marked declines in December, both in import and export business.

Another attempt is to be made to establish a direct steamship line between Constantinople and New York.

The postal administration of Norway and the Postmaster General's office in Washington have agreed that the maximum weight of parcel post packages shipped from the United States to Norway is to be increased to 11 pounds.

Making Swiss Cheese in America

(C) Harris & Ewing

K. E. Parks, a dairy engineer in the Department of Agriculture, has invented a cheese press which is expected to revolutionize the cheese industry in the United States. The press is an hydraulic one and completes the operation in 24 hours. The old method involves a lever press and heavy weights.

Farm wages in the United States during 1920 were the highest in history. The average wage, as ascertained by the Bureau of Crop Estimates, was $46.89 with board and $64.95 without board. For day labor at harvest the wage averaged $3.60 a day with board and $4.36 without board. In 1895 the average farm wage in the United States was $17.69 a month.

As a result of discovery of the underlying cause of "root rot" by the United States Department of Agriculture, corn crops may be increased 10 per cent.

According to official figures, in 1921 Germany must import 3,000,000 tons of grain, 1,500,000 tons of fodder, 1,000,000 tons of raw material for manufacture of oleomargarine and 150,000 tons of meat and bacon.

The barberry bush seems doomed. Almost 5,000,000 bushes have been destroyed since the Department of Agriculture discovered that the fungus responsible for wheat rust starts in the spring on the barberry plant.

The prices paid crop producers for their products declined 4.7 per cent during December.

Creamery men have protested against the tax of 10 cents a pound on adulterated butter.

The fourteenth Belgian automobile show, held recently in Brussels, was a success in the amount of attention which it secured from the public and in enthusiasm aroused for new models. The buying, however, was not as brisk as had been expected.

The census of 1920 shows 21,109,000 horses and 4,995,000 mules on farms, an increase of 1,276,000 horses and 785,000 mules in the last ten years.

Michigan women attending the Housewives' Congress at the state agricultural college are being taught simple methods of testing wool, cotton, linen and silk with common kitchen chemicals.

The American trade commissioner in Tokyo has forwarded to the Bureau of Foreign and Domestic Commerce a list of suggestions for American manufacturers who ship goods to Japan. These suggestions are approved by Japanese importers and are recommended for the guidance of exporters.

Specialists of the Department of Agriculture are studying the question of establishing standard grades for tobacco. Lack of standard grading is said to cause great loss to many producers today.

When blackberries and raspberries which are otherwise healthy fail to renew themselves by means of new suckers there is a shortage of nitrogen in the soil.

Government expenditures in Mexico continue to exceed revenues.

A large number of breweries have been cited to show cause why their permits should not be revoked. It is alleged by the prohibition commissioner that these breweries manufactured a product containing more than the lawful amount of alcohol.

The campaign to stop the sale of patent medicines containing more than the legal per cent of alcohol, which has been going on in certain sections, will be made nation-wide.

The farmers of the United States own nearly 2,000,000 automobiles.

One-third of the United States has been covered by soil surveys made by the Bureau of Soils.

There are 8,000,000 farms in the United States, 2,500,000 of these containing more than 100 acres.

Cuba is protesting an increase in sugar tariff because it would cause hardship to the sugar industry of that country and might affect trade relations with the United States. In 1920 Cuba bought $470,000,000 worth of goods of the United States.

Huge losses are caused growers and shippers annually through the freezing of fruit and vegetables in transit, and in an effort to overcome this the Department of Agriculture has made a long series of tests of heating equipment for use in both refrigerator and ordinary box cars. Service tests will soon be completed and shippers given the benefit of the experiments.

Experts of the Department of Agriculture have discovered a heretofore unknown substance in soil. They have called it "ultraclay."

Co-operative work among North Carolina farmers is said to have saved the growers $75,000 to $100,000 on their potato crop.

Beet growers from nine states—Ohio, Michigan, Indiana, Illinois, Wisconsin, Iowa, Nebraska, Colorado and Utah—are planning a national association.

UNIV OF ILL LIBRARY
URBANA ILL

Briefly Told

In education the United States occupies ninth place, which means that most of the civilized world is ahead of us, according to official report of the House Committee on Education.

It is estimated coal men extorted one and one-half billion dollars from the public during 1920.

Siberia produces more fur than any other region in the world, North America being second.

Forty-four hundred persons committed suicide in Hungary during 1920. In addition there were more than 10,000 unsuccessful attempts at suicide.

The West Virginia state penitentiary will soon be self-supporting. A coal mine on state property will be operated by the prisoners. The new mine is now within eight feet of a vein of fine coal which underlies 165 acres of the prison farm.

Breweries of Zurich are using Austrian one-crown bills as labels for beer bottles. They find this to be a paying proposition for the reason that people eagerly collect the banknote labels in the hope that the crown may rise from its present value of a quarter of a cent.

It costs more to send a bale of goods by truck across Manhattan than to ship the same bale from New York to Buenos Aires.

The world's highest peak lies in Tibet north of the British Indian border and no European has ever approached nearer than 69 miles from its base so far as is known. Sir Francis Younghusband, the British soldier-explorer, will attempt to climb to its summit next summer.

The 1920 value of Canada's fur farm industry is placed at $3,968,591.

The Japanese Empire consists of 260,000 square miles, with a population of about 77,000,000.

Sixty per cent of the normal freight carried by all the railroads of the United States consists of the total products of the mines.

Peat contains from 80 to 90 per cent water.

Our present production of hydro-electric power is roughly equivalent to 40,000,000 tons of coal.

A German inventor is said to have perfected a method by means of which he is able to take an ordinary cheap violin and make it the equal or superior in tone to the masterpieces of Stradivarius, provided the violin is unvarnished.

The word "please" used in telegrams alone costs the United States $3,000,000 yearly, yet it is cheap at the price.

More than a third of all our Asiatic imports comes from Japan, and more than half of our exports to the greatest of continents goes to Japan.

Santo Domingo is larger than West Virginia and its interior is untraveled and little known.

Nearly one-third of the cities having dance hall legislation are in the eastern or Atlantic states, most of them in New England. Another third are in the central states; the South has the smallest number.

A large percentage of the mission hospitals of China, of which there are about two hundred and fifty, are destitute of hospital essentials, such as clean clothes, nursing service and pure water.

Argentina is manufacturing paper from a species of bog grass called "paja brava." The grass grows during the entire year and in swampy sections it has been considered a nuisance.

Our supply of lignite coal amounts to about 20,000 tons per capita.

We annually consume around six hundred billion cubic feet of natural gas, which is twice the volume produced by all the gas works and coke ovens in the country.

America produces ninety per cent of the world's output of Indian corn.

Every fire truck in Shanghai has a wireless telephone outfit to communicate with the station to which it is attached.

The State Department issued 164,354 passports during 1920.

An edict against the wearing of short skirts and the displaying of arms has been issued by the city magistrate of Shanghai. In future offenders will be arrested and fined.

Sweet potatoes are used as silage in the South.

An electric fan has been invented fitted with a combination powerful heater having a nichrome element. Thus it may be used to blow a current of heated air which will raise the temperature of a room quickly.

A thousand cubic feet of hydrogen gas will lift sixty-eight pounds.

Flour, sand or dirt is the most effective extinguisher of gasoline or oil fires. The use of water only spreads the flames.

There are about 336,000 Indians in this country, exclusive of Alaska, distributed among some 130 reservations, of which 180,000 are full-fledged citizens of the United States.

The first "dry" year has cost the United States Government and the various state governments about $1,000,000,000 in loss of internal revenue taxes and in cost of enforcement.

Nickel steel with a platinum covering is being used to displace platinum wire in incandescent lights.

Shark fishing on the Pacific Coast is being developed into an industry. Near Vancouver Island sharks are caught at a depth of 125 feet. Many of them are 35 feet long, and are known as mud sharks, not man-eaters. The skins and livers are utilized similar to the methods in vogue on the Atlantic Coast.

A new railroad in Ecuador from Quito to the coast will make accessible about one million acres of fertile lands covered with virgin forests, situated about 9,000 feet above sea level, with a good climate and the land generally level.

Among the persons arrested in Washington, D. C., during the past year were two diplomats, one Congressman, one hundred reporters, eighteen editors, one professor, 248 army officers, forty-one ministers—and forty-eight policemen.

All mail sent by airplane is wrapped in an asbestos cloth container that is fastened to the plane by thin steel strips and screws. The fireproof bag has been tested and after treatment in an intense fire the contents were found intact.

The number of ex-service men who have taken advantage of the benefits offered by the Federal Board for Vocational Education during the last fiscal year has increased from 3,606 to more than 46,000.

Alaska bought more thrift stamps per capita in 1920 than any state in the Union.

During 1919 there were 1,040,000 marriages in the United States and only 70,000 new dwellings completed.

Since the United States went dry the British liquor exports have tripled. Canada, the Bahamas and the West Indies are the importers.

One-fourth of the world's savings is held by the inhabitants of the United States.

The average meat consumption of the world is 39 pounds a head. The American and the Australian eat about 180 pounds a head and the Englishman about 120 pounds.

Havana is farther west than Cleveland and Nome, Alaska, is farther west than Hawaii.

Almost every variety of iron ore has been found in New Zealand.

The Delaware state senate has passed a bill making the penalty for highway robbery while armed twenty years' imprisonment and a fine of $500 and forty lashes on the bare back.

More than a third of the 435 members of the House of Representatives at Washington have one or more relatives on the House pay roll as their own clerks, stenographers or secretaries. Many of these relatives actually perform no service at all and some do not even live in Washington and never have been there.

Where Co-operation Starts at High Speed

Minnesota Farmers Combine to Market Potatoes

By EARL CHRISTMAS

IF YOU don't appreciate how readily farmers may solve their own marketing problems in large measure, a visit to Minnesota will prove instructive. There, in a state that has been a pioneer in co-operative enterprise, you will find the Minnesota Potato Exchange. Now, the potato exchange is an infant as far as age is concerned, but potentially it's a young giant, eloquent of the new-found power of the farmers through organized effort. Perhaps no group of farmers, to anticipate this story somewhat, has been able to get such far-reaching results in a short time. And no new-fangled laws were necessary.

Launched by a small group of farmers in the winter and spring of 1920, the Minnesota Potato Exchange came into existence on the jump. It had the pledges of thirty local shipping associations of potato growers—not a very pretentious number—and that was about all, except a conviction that the growers could save money by shipping and marketing their own crops.

In six months seventy additional local shipping associations of potato growers in all sections of the state had been organized and affiliated with the central exchange. Five thousand potato growers had pledged their crops to the new venture in farmer marketing.

Meeting in Wadena, Minnesota, July 12 to 21, 1920, the growers perfected a permanent organization, and when their crop was almost ready for the market, went about the task of setting up the machinery to market it. Just then, they were not very many jumps ahead of the game. First thing, they had to have a manager. Looking around for a man who knew the problems of the farmers, they employed A. W. Aamodt, county agent of Beltrami County. That was on July 21. Aamodt took the first train for Michigan, and spent a week studying the system of the Michigan Potato Exchange.

Returning to Minneapolis, he opened state headquarters of the exchange there August 1. And there were few jumps to spare. One week later, the first of the Minnesota potato crop, shipped and sold by the producers, was going through the exchange. And producer-marketed potatoes have been going to market in rapidly increasing volume ever since in Minnesota.

Early in January, more than $1,700,000 worth of potatoes had been marketed through the exchange, and officials of the new organization, surveying the amounts pledged by the local associations, estimated that the year's business of the exchange would reach $4,000,000—not so bad for the first season.

Approximately one-fourth of the Minnesota crop is being marketed through the exchange. By January, more than 2,000 cars of potatoes had been sold through it, and thousands of dollars had been saved to the producers. Prices paid farmers were ranging from 10 to 30 cents a hundred pounds higher than private shippers were paying, while there was no way of estimating the extent to which competition of the farmers' organizations had forced up prices of the private buyers in most of the potato producing centers. Next year, there will be fully 150 local associations of growers in the exchange, according to its officials, and from one-third to one-half of the Minnesota crop will be marketed through the exchange.

That's how fast co-operative projects get under way in Minnesota.

Incidentally, Minnesota commands attention when it comes to co-operative marketing. Products marketed by the various co-operative enterprises in the state run from $150,000,000 to $200,000,000 a year in value. A. D. Wilson, director of the extension division of the Minnesota College of Agriculture, is authority for that statement. He placed the value of live stock marketed through co-operative shipping associations at $70,000,000 a year, and the annual business of the co-operative creameries at $50,000,000 a year.

John D. Black, of the division of research in agricultural economics at the college of agriculture, who has made a survey of the co-operative organizations of the farmers in the state recently, put the number at 3,638. Of this number, 1,747 are marketing associations purely; 190 are producers' associations; 335, buying organizations; 170, financial, and the rest are miscellaneous.

In 1919, Mr. Black reported, co-operative live stock shipping associations handled 59.6 per cent of the live stock shipped to the South St. Paul market from Minnesota farms. W. A. McKerrow, secretary of the Minnesota Central Co-operative Farmers' Live Stock Shipping Associations, says there are now 550 such local associations in the state, and that they are handling fully 80 per cent of the live stock shipped to South St. Paul from Minnesota farms.

Of these co-operative enterprises, Mr. Black discovered further:

There are 427 elevators, shipping 39 per cent of the grain shipped in the crop year of 1918-19.

There are 668 creameries, which made 63 per cent of the butter in Minnesota in 1918.

In other words, co-operative marketing is in the air in Minnesota. So it was no great wonder that the potato growers caught the fever. But selling potatoes was different from selling wheat or live stock. There was no convenient exchange or market offering at one point the advantages of world prices. So the potato growers, early in their organization efforts, decided to overcome this handicap as far as possible and incidentally go one step further than the other co-operative shipping associations by forming a central selling agency for the whole state. Their marketing machinery would have to reach all the way to the retailer, they decided. And practically, that is the thing the Minnesota potato growers have accomplished in these few months.

But quite as interesting as the speed with which the exchange has been developed, is the affect of the venture on prices paid by other buyers of potatoes.

"Owing to inadequate facilities, the association at Blackduck had to stop taking potatoes," Mr. Aamodt said. "Prices dropped 20 cents immediately. At East Grand Forks, it was the same way. The warehouse there became piled so full that the association had to quit buying for a day. Prices paid by other buyers dropped 25 cents.

"North Branch was one of the poorest paid points in the whole potato producing area. After the co-operative association went into the business, the other dealers not only came up on their prices, but actually paid 10 cents more than the Chicago market to get potatoes. Jasper, where one of the new associations was formed, was getting 20 to 25 cents more for potatoes than farmers at surrounding towns where there were no co-operative associations.

"Where there were no co-operative associations, the farmers could hardly sell their potatoes at all many times."

Hugh J. Hughes, director of markets of the state department of agriculture, late in the year sent out an inquiry to all county agents in the state as to prices paid at co-operative and non-co-operative points.

"The co-operative market prices quoted indicated an average price covering the last ten days in October of $1.0125," Mr. Hughes said, summing up his findings. "Compared with this, the non-co-operative prices show an average of $.9185. The spread amounts to $.093.

"The widest spread between co-operative and non-co-operative prices appears at points where there is no competition. In some instances the variance was as much as 25 or 30 cents, and in one case 40 cents. Where competition is active between the private shippers and the co-operative organizations, the spread is much narrower. This indicates, in the opinion of the department, that the creation of the state-wide exchange has had the effect of bringing up the prices to the farmer at competitive points. The benefit of such price increase, of course, goes to all farmers in the trade area.

"Assuming an exportable group of 20,000,000 bushels (12,000,000 cwt.), the spread of $.093 per cwt., indicates that had all the potatoes of the state been marketed around November 1, the co-operative price level would have given the farmers $1,096,000 more than the non-co-operative price.

"Since approximately one-fourth of the potatoes are being marketed co-operatively through the exchange, one-fourth of this amount, or $274,000, may be regarded as the direct saving to the farmers through the use of co-operative marketing. This does not take into consideration the general boosting upward of prices, due to the competition between co-operative and non-co-operative buyers. In this saving, not only the farmers using the exchange, but all the farmers in the state benefit."

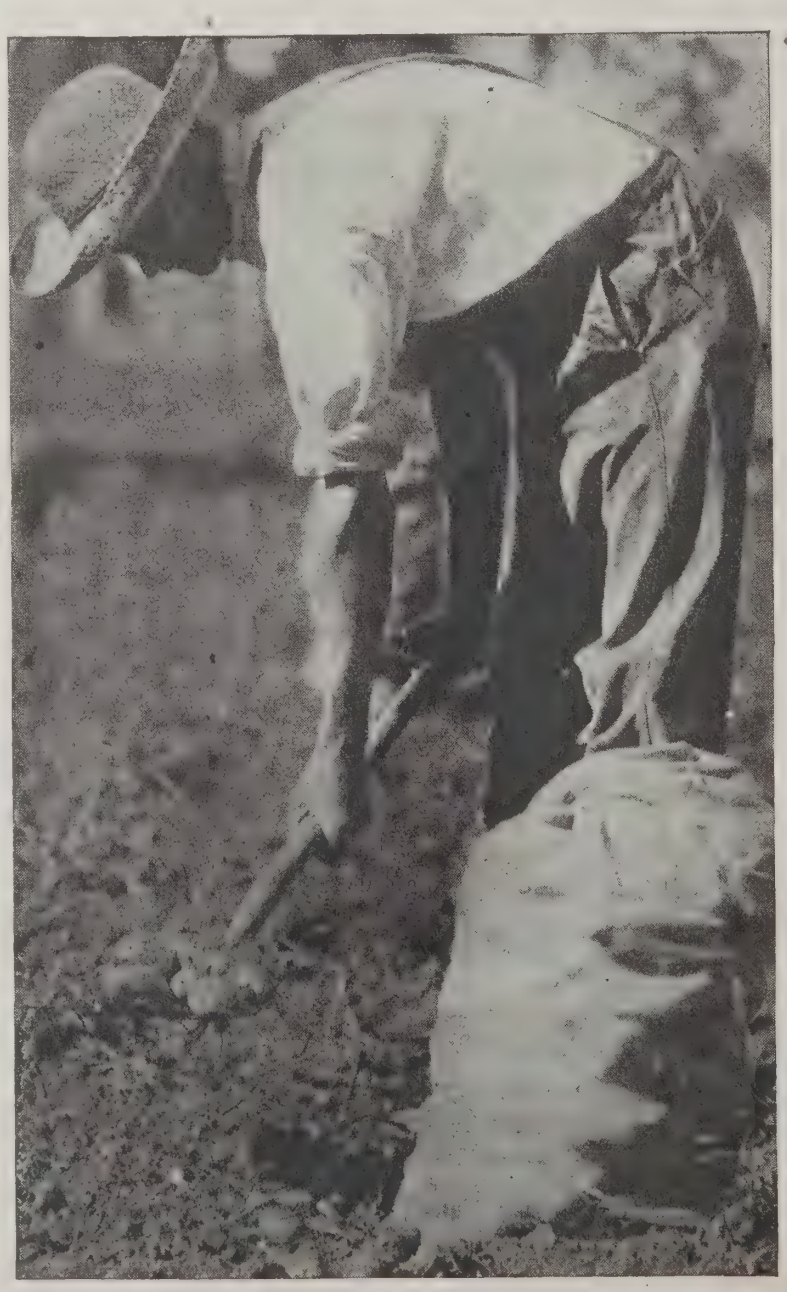
Private dealers have been forced to take narrower and narrower margins. Officials of the exchange estimate that the exchange has put more than a million dollars into the pockets of the farmers through this general upward boosting of prices.

"You know there are two theories of co-operative enterprise," Mr. Hughes explained. "One is that you must control enough of the crop to constitute a virtual monopoly and be able practically to set a price. The other theory is that, as long as you have a guaranteed quantity, whether big or little, you will get the best price the market can bring, and benefit not only the farmers co-operating, but their neighbors as well.

"Co-operative marketing is cutting down local expenses in the potato industry. But more than that, it is tending to stabilize prices. It is the same in other lines of co-operative marketing. When co-operative marketing has developed sufficiently, you will have this situation—the producer, with a certain part of the year's crop pledged, will go to the consumer and say, 'How much will you give for the crop?'

"Producer and consumer will agree on a price. Everything is working in that direction. Co-operative organizations are springing up in the producing end of the game to sell more effectively, and in the consuming end of the cycle to buy more effectively. More and more we are coming to eliminate the middleman. As co-operative marketing develops, seasonal fluctuations in prices will decrease. Temporary inability to get cars and like factors will have less affect on markets. Buying will be over longer periods and in bigger quantities.

"Particularly in the potato industry has the farmer been subject to the uncertainties of a local market. The Potato Exchange, placing right at the jump one-fourth of the state's crop in the hands of a single selling agency, and opening up to the farmers daily the markets of the entire country, already has done wonders toward stabilizing prices and getting for each farmer the best that the season's market affords."



The Minnesota Potato Exchange is entirely under producer ownership and control. Real "dirt" farmers, men who grow potatoes, are its officers and directors. Each grower pledges his crop to the exchange. At present products are distributed through a private company under contract. There is a growing movement, however, to develop a big, national distributive organization, serving all the various co-operative fruit and farm industries.

Each evening Aamodt wires markets over the country the quantities of potatoes to be shipped the next morning and asks for bids. To the best bidders he directs the shipments, sending the cars direct from the local association to the retailer or jobber making the purchase. All the potatoes are pooled by the growers. In other words, if one retailer buys a car at a high figure, and other cars must be sold at a lower figure, one grower gets no more than the others. Each gets the best the market offers on that particular day. If there are profits above the nominal handling charge, the farmers get the dividends.

"That first week was a wild one," Mr. Aamodt said. "We had to build up our whole organization and get ready for the potato shipments in six days. It sure kept us jumping. Now, we are able to catch our breath for the first time."

But the working of the exchange did not reveal the speed with which this $4,000,000 a year enterprise came into being. The infant was acting very much like a veteran.

Minnesota, Michigan and Wisconsin produce annually more than 90,000,000 bushels of potatoes, almost a fourth of the total production in the United States. With a successful exchange already in existence in Michigan and the new enterprise in Minnesota, farmers in these states soon will be performing a very considerable portion of the job of marketing their own potatoes.

Formerly the farmer considered he had done all he could do when he dug his potatoes. Now, in Minnesota, he is going a step further and marketing them in co-operation with his neighbors.

"Western Stuff"—By JOHN B. WALLACE

Harry Carey's ranch during a neighborhood party. Carey and his horse "Dynamite" are shown marked by crosses. The picturesque Carey is at the right in a close-up.

THERE has always been an unfailing source of comment for paragraphers in the fact that so many if not the majority of our western tales filled with long-haired bad men with innumerable notches on their "weepons," howling redskins and gamblers appareled in undertaker clothes were written by bald-headed and gray-thatched pen pushers residing along the Atlantic Coast who placed Pittsburgh and Buffalo as the frontiers of civilization.

But when it came to the movies the lover of this class of literature thought that at last he was getting the real thing. Surely those cowboys, anyway, could not be faked. They must be the survivors of the inexorable march of civilization. Why, look at the way they ride, rope cattle and roll cigarets with one hand. But alas, for illusions!

The other day I saw them filming a scene from a western drama out at Hollywood in California in which the hero was a cowboy, born and raised on the East Side in New York, the script was written by a native of Boston and the scene was being directed by a man from Maine. The only westerners on the lot were the writer, who was born in Wisconsin, and the camera man who claimed Ohio as his birthplace.

While this particular play was being shot in the West thus providing the western atmosphere, at least, it is an axiom among the studios that most of the western stories are filmed in the East and most of the eastern stories are taken in the West. It keeps the railroads busy hauling potted palms and other tropical shrubbery back to the eastern studios and returning with loads of Maine and New England stuff.

As a matter of fact, I know of no actor who has become popular through playing western leads, who is a real product of the great plains. Some of the cowboys used in minor rôles and in posses and ranch scenes are the real article but the heroes and even the villains are taken from reel and not real life. And when you think of it, this is only natural.

It would be indeed remarkable if a ranch hand could be seduced from his job of herding a bunch of longhorns and converted into a star before the camera. It takes an actor with years of training in the art to make good in the pictures. It is far easier to teach an actor to throw a rope and ride a horse than it would be to train a cowboy in the art of acting.

Thus we have in Harry Carey, perhaps the most popular exponent of the western thriller on the screen, or at least he shares that honor with Bill Hart and Tom Mix, a cowboy hero who was born in New York City, whose father is a judge of the Court of Special Sessions and who has, himself, been admitted to the bar.

Carey is a graduate of the City College, New York. He intended to become a lawyer but the lure of the stage proved to be too much for him. That old classic melodrama, "Uncle Tom's Cabin," was his first vehicle although he failed to confide to me whether he played Simon Legree or the bloodhounds baying behind the scenes as Eliza crosses the ice.

He later drifted into stock and at one time took out his own road show in which he was the leading man. And then came the motion pictures to lift him out of obscurity as they have many an actor and actress who was only mediocre on the speaking stage.

Carey broke into the movies with Blanche Sweet who also was destined to stardom in the new medium for dramatic expression. One of his first parts called for him to ride a horse. Carey had done a little riding in riding school in New York but to ride like one is taught in a riding academy and to ride like a western cowboy are two different things. Carey had to learn to ride and by the time he had learned he had begun to like it. Today, he is considered one of the best riders in the business. It was the same in learning to rope cattle.

In learning western ways, however, Carey has become a real westerner. Thirty miles from the studio where he works, in the hills north of Los Angeles, he homesteaded a ranch of 160 acres. There on his ranch and on neighboring government land he runs a herd of Herefords. And also—though tell it not to a real cattleman—he has a flock of sheep.

Thus he manages to keep his cowboys employed when not working in pictures. Carey is a regular fellow with none of the up-stage airs so characteristic of newly-made screen stars. He is very popular with his neighbors around his ranch and several times a month he gives a big party to which everyone in the country is invited. They are regular old-fashioned hoe-downs with the old fiddler and all the local color.

Because of his versatility Carey is destined to long years of popularity. He can act the polished gentleman as well as the untamed cowboy. When he gets through with the screen he is going to practice law and devote his spare time to developing his ranch.

The Sugar-Eat

WHEN the backbone of the winter is broken, and the sun has power enough to thaw the snow in the middle of the day, although it freezes again at night, then come the days of sugar-making. On the hills where the maple trees grow, the sugar-maker is found. He taps the trees, drives in a spigot, and places a bucket underneath to catch the fast-dripping sap. Twice a day the sap is gathered, and then boiled in huge pans until the consistency of sugar is reached.

Then it is that the young men and maidens throughout the district where the sugar is made, have merry times. Almost nightly a "Sugar-Eat" is held. When a large number is expected a hall is used; with smaller gatherings, a private house.

Maple syrup is placed in a kettle on the stove and boiled, and the girls take turns in watching and stirring the pot.

It is the duty of the boys to fill large pans with snow, which are then placed upon tables down the length of the room. When the syrup in the kettle has reached the proper consistency, it is poured upon the snow and, equipped with forks, the company range themselves on either side of the tables, and eat the "wax" before it hardens.

Those evenings when the "Sugar-Eats" were held were full of sweetness. Even the temper of the grouchiest man or woman there seemed to imbibe some of the prevailing spirit.

I could not help thinking, as my memory went back to the last "Eat" I attended, what a delightful thing it would be if we could occasionally have a "Sugar-Eat" in life; a period of time when nothing sour or unhappy could creep in.

Think of a whole day where there was nothing but sweetness! Even if the milkman did not arrive in time for breakfast; and the cars were so crowded that you had to stand; and the elevator ran past your floor when you were in a hurry to get in on time!

"A dream of Utopia," you say! Yes, perhaps! And yet, for a few hours on a certain evening those country people forgot the weariness of the unceasing grind of their lives, and the long, dark days of the winter months, gone and to come, and gave themselves up to the sweetness derived from the life of the maple tree, and felt all the better for it.

It wouldn't do any harm to start a little individual "Sugar-Eat" of your own some day, and see what happens. It's worth trying!

Sense About Immigration

JUST now there is a concerted and persistent confusing of the public mind on the subject of immigration. Pseudo-patriots are tickling the ears of the groundlings by sonorous assertion to the effect that America owes its greatness to its widely opened door and its welcome in the past to the poor and oppressed of other lands. We are bombarded by reminders of the obvious. With the exception of the red skins, we are told all of us are "immigrants," even if several generations removed. In the United States Senate, one of our grave and reverend seignors has risen in his place and proclaimed that the "literacy test" would have excluded his own sainted and noble father. To the waving of the Stars and Stripes and the strains of "My Country 'Tis of Thee," pressmen and platformers strive to make us feel that to favor restrictions or regulations likely to "keep out the immigrant" is somehow to be churlish and un-American—perhaps tainted with some narrow and foolish prejudice, some "anti-Semitism."

It is refreshing, therefore, to find the whole subject treated with the sense and simplicity that pervades "Immigration and the Future," by Frances Kellor, probably the greatest immigration authority in America. Contrary to widely accepted theories, put forth by those whose assurance is in inverse ratio to their actual knowledge of the subject, Miss Kellor takes the ground that the immigrant problem is an excrescence which will not be absorbed into the body politic, but that it is more likely to spread and in time thoroughly poison the entire citizenship, exactly as any large number of foreign bodies will disturb and disease any living unit, be it a single human unit or a country of such units.

Israel Zangwill's play of that name, made "the melting pot" a sort of magical phrase. It has almost come to be adopted as an explanation of the miracle of assimilation and Americanization. But even the metallurgist uses some selection in regard to the chemical combinations he attempts in his crucible. And he usually tries out his experiments in a laboratory before turning the whole country into one big fiery furnace.

Somewhat on this line is the solution offered by Miss Kellor. She would create a board of men and women who are experts in immigration, experts in foreign conditions and the human tendencies of the world's citizenship. Under our present methods, practically no effort is made in the direction of actual selection and assimilation of the immigrant. From his landing on Ellis Island, he is surrounded by his own racial atmosphere and remains alien, and often antagonistically alien to American institutions.

The Buyers' Boycott

ABOUT the most hopeful sign of a return to "normalcy" is the success of the buyers' boycott evidenced in the fact that at last retail prices are coming down all along the line. Hardly a day passes without the announcement of welcome, if tardy, surrender on the part of middlemen and retailers to the determination of the buying public to hold off on purchases as long as high prices reigned.

This country is far from being alone in its present experience of business depression. From France, Great Britain and Belgium come reports of stress in the industrial, economic and financial situation of which uncertainty and anxiety are the keynotes. And in all these countries, it is felt that the only solution of production difficulties lies in a resumption of buying by the public. This, however, is delayed by the determination of the larger part of the purchasing public to bring down prices from levels they believe to be unjustified. Advantage is taken by sensational reductions made by large stores over short periods to get hold of needed cash, but this only palliates the evil. Producers in many instances are urging retailers to make permanent cuts in prices and express a willingness to supply new stocks at prices much below those of last year, to be able to keep mills and factories running. But middlemen who have loaded up at the old prices persist in maintaining the price level.

The remedy of the buyers' boycott is a desperate one at best. Unfortunately, it simply starts a vicious circle. Decline in the demand for goods by the ultimate consumer, causes, in short order, reductions and cancellations of orders by retailers, then by jobbers. Production ceasing to be profitable, factories are obliged to shut down; men are thrown out of employment and the falling off in demand through lack of purchasing power is further intensified.

On either side of the Atlantic abnormal rates of exchange caused in part by grave disturbances in the normal balance between exports and imports—but made decidedly worse by the speculation on exchange which offers to market gamblers such temptations to make easy money—is largely responsible for trade dullness. With the dollar costing three or four times as many francs as it did before the war and the pound sterling worth at least a third less, French and British buyers are largely shut out of our market. In the degree that American manufacturers are deprived of the export outlet for surplus production, they are forced to reduce production. Reduced production means, of course, hard times and high prices.

It boots little to be reminded that dull and disturbed economic conditions prevailed for nearly seven years following the close of our Civil War and so, comparatively speaking, we are doing well. Progress is an empty phrase if we do not know more than did our fathers and grandfathers concerning the possibilities of intelligent control and direction of economic conditions. The truth is that only very recently we demonstrated on a tremendous scale the possibility of preventing or meeting and correcting conditions which if uncontrolled make for disorder and distress. Throughout fifty-one months of the most destructive war in all history, we were enabled to maintain normal parity of exchange rates and, despite an almost cataclysmic disturbance of normal conditions, to finance war efforts on an unparalleled scale of expenditure. The needs of the emergency were perceived in the very first weeks of the war and the financiers and governments of the Allies got together and adopted measures that made it possible to avert financial and economic panic and disaster. Why not get together now? Is it because certain groups of international manipulators of money find it more profitable to fish in troubled than in clear waters?

Muscle Shoals Again

IN THE annual sundry civil appropriations bill recently reported to the Senate out of committee, and involving a total expenditure of the people's money of $410,921,000—which is an increase of $28,437,000 over the House total—there is one particular item which will bear watching. This is an additional appropriation of $10,000,000 for the hydraulic power project at Muscle Shoals, Alabama.

Testimony taken before the House Select Committee on War Expenditure a year ago tends strongly to show that this project, which has already cost the people millions of dollars, was originally conceived and carried out principally, if not wholly, in the interests of the nitrate trust. Advantage was taken of the nation's war need of nitrates for explosives to persuade the government to go into enormously expensive construction work at that point. It was brought out that the actual quantity of nitrates produced was a mere flea-bite compared with the money spent on the project, and spent in a wildly wasteful and extravagant manner. The contractors had steadily in mind the post-war use of the plant in the manufacture of commercial fertilizers. The Secretary of War, however, took the ground that the plant would have immense national importance in any program of preparedness for the next big war.

The Senate appears to have been more appreciative of this argument than was the House, which refused to vote the ten millions. We have long been accustomed to regard the "Upper House" as a sort of safe and sane balance wheel in our legislative system. Has the time come when we must depend upon the House of Representatives for truly conservative thought and action, and look to it to check the "haste and heedlessness" of the Senate? Or are the same interests that stood behind the Senate rejection of the Johnston immigration measure also behind this attempted raid on the national treasury in the interests of the nitrate trust?

Should War Debts Be Cancelled?

WILLIAM J. BRYAN and Austen Chamberlain, British chancellor of the exchequer, seem to be of the same opinion as to what should be done with the inter-Allied war debts. Both would wipe out the debts with a sponge, much as that Missouri statesman, Richard A. Bland, some years ago proposed that we should wipe out our own national debt. Mr. Chamberlain reveals the fact that about a year ago the British Government formally proposed such a cancellation, but that the proposal fell through because it was unacceptable to the American Government. Incidentally, he makes it appear that Uncle Sam is playing a far less chivalric rôle than is John Bull, in that the British would have foregone claims much larger than any remitted to them, "seeking no national advantage and believing the proposal would be in the interest of good relations among the allied peoples, the rehabilitation of national credit and the restoration of international trade."

The sum total of these inter-Allied debts is estimated at about sixty billion dollars. This, by an odd coincidence, is just about the total demanded from Germany by way of reparations. Whatever money Germany "lent" to her allies, Turkey, Austria-Hungary and Bulgaria, she has perforce forgiven them. Germany's own war costs probably exceeding by two to one the war expenditure of France, Britain or America, were raised by taxation and by loans floated among her own people. In addition to the nearly ten billions of dollars lent to the Allies by the United States, our people subscribed liberally to French, British, Italian and Belgian war loans, while our own war loans came entirely out of the pockets of our own people.

We have shown no disposition to press our European debtors. On the contrary, we have deferred for three years the payment of the first year's interest and shown a disposition to grant further time if needed. It is to be taken into account, however, that the actual war expenditure of the United States during our nineteen months of participation in the conflict was nearly double the actual expenditure of France during the entire fifty-one months of the war. Our industries are today staggering under an unprecedented burden of taxation imposed by that expenditure. There is no doubt that, in so far as the wiping out of the inter-Allies' debts would help to bring about a rehabilitation of international trade, America would benefit in the long run. Accepting Mr. Chamberlain's assertion that Britain would lose more than she would gain by the operation, it is clear that France would be enormously helped. And remembering how enormously France's manhood sacrifice in the war outweighs that of any other of the Allies and remembering France's pressing need for help at this very moment, no one can doubt her claims on our fullest consideration.

But while we are forgiving debts, let us be forgiving all round. France owes to Great Britain and the United States some ten billions of dollars. If France is forgiven ten billions of debts by the Allies, would she be willing to reduce her bill against Germany by a like amount? And if not, why not?

Capital Punishment

ONE of the aftermaths of the late war is the wave of crime which has swept the country and which no amount of police vigilance seems able to suppress. For four years men were engaged in the work of destruction. All the values so carefully built up through the centuries were demolished, all the moral restraints broken down. In short, all the rules by which civilization protects itself were thrown into the discard and an entirely new set, the fundamental purpose of which was to destroy, rather than to construct, were set up in their place. Weak minds could not stand that test. They warped in the heat of the trial. Nor were they the only ones to suffer. All mankind suffered from the sudden lowering of standards.

This ground cannot be regained at once. Retracing our steps, rebuilding our shattered ideals, resurrecting respect for law and order will take time.

Meanwhile it seems rather foolish for some state legislatures to be considering the question of instituting capital punishment as a means of checking crime. There is considerable doubt, in the first place, as to whether capital punishment lessens crime and there is more doubt over the advisability of destroying our whole system of penology, built up so painstakingly during the last few generations.

If we are on the right track in our efforts to reform as well as to punish the criminal, if we are correct in our belief that society profits most in the long run when those who break its laws are treated humanely, then it is foolish indeed to allow an exceptional and temporary condition to upset all this for the sole purpose of a brief revenge.

Mr. Ford's Page

AMONG the dishonest ways of getting along is the practice of working on the self-esteem of men by praising them to such a point that they feel inclined to favor you. Some crooks chloroform their victims to rob them; others just suffocate their good judgment with praise. The first method has at least the virtue of directness; the second, even at its best, is suspiciously on the other side of frankness.

We have developed in this country a habit which must be modified by honesty, and that is the habit of back-slapping and indiscriminate boosting, the glad hand and the oily compliment. These never did go down with men of hard horse sense, but they had a considerable and pernicious influence on young men, because young men naturally thought that this was the standard way to do things.

Now, this is a situation which more mature business men have observed with something of impatience and something of misgiving. It must not be assumed, however, that they regretted to see a more human tone come in business relations. Nor must it be assumed that they protest because their ideal of a business man is one who is strong as steel and just as cold, who cannot be bent, nor even melted except in the hottest fires.

There is just the danger, that returning from the orgie of back-slapping and artificial good fellowship which has marked the last few years—the era in which the "smooth" person "got by"—we shall revert to the opposite extreme of coldness and brutality. Not at all. Extremes are always to be avoided. But whatever the attitude, *sincerity* is desirable about all things. And it is just the lack of *sincerity* which made so much of this praise-mongering to be nauseating to plain men.

There are two great barriers to the free intercourse of minds, to absolute transparency of conduct, and they are, first, a designing attitude toward another; and second, that which the designing attitude breeds, namely, su ion in the mind of the man against wh n the design is laid. They are both unw holesome mentally, and disruptive socially. They constitute the major part of the silent warfare of life.

Now, all men like praise. If a man says he doesn't, he should examine himself again. He may not like to be praised to his face. He may be irritated by the fawning form in which praise is offered him. He may be angered by his knowledge that the offered praise is insincere and has an ulterior motive. He may be sickened by the hollowness of it. A man who had done something very well was once pained by the praise he received. He said, "They all praised me for the wrong thing." They had not considered his work enough to see the real point in it. And what he wanted was not the sticky sweetness of personal compliments, but discriminating and appreciative consideration of his work.

All men like their good work to be praised—but that is quite a different thing. There is something normal and wholesome about friends being able to meet frankly in consideration of a piece of work.

So, if a man says he dislikes praise, he must define what he means. When a man is able to praise his own work to himself, to behold the work of his hand and take pleasure in it, he is taking praise, just as much as if he eagerly drank in compliments spoken by another.

Now, the evil of life consists in all these wholesome and pleasurable sensibilities being misused to selfish ends. No matter what department of human nature you look into, the evil you see comes from selfish misuse. And so men have brought in evil through the gate of praise.

If you see that a man's weakness is flattery, and you take advantage of that to manipulate his judgment and his will, you are following precisely the same tactics as the man who sees another's purse conveniently exposed, and takes it.

If you see that a man is built of such malleable material that a friendly, complimentary advance disarms him and lays him open to your power, and you deliberately thus disarm him for the accomplishment of your design whatever it may be, good or bad, you are working along a dangerous line; you are exalting yourself to a place which no human being is entitled to assume toward another for reasons of profit. It is a serious thing to descend to this kind of strategy or trickery even for the best purposes.

No one takes these tactics without sacrificing a great deal of sincerity. And besides, they are not necessary. There is nothing that this sort of strategy can accomplish, that frankness, honesty of purpose and even blunt truthfulness of statement cannot better accomplish. The straight open way is healthier for the mind of the man who is making the advance, and it cements a better relation with the man who is being advanced upon.

Now, inasmuch as there are still in the world many hold-overs from the last régime who still trust in the strategy of the tongue, it is just as well that young men, especially young business men, should be on their guard. Instinctively, the majority of them are. There is something inside the normal human being—a sort of spiritual submarine detector—which warns of the approach of hollow words. Many lies are told: very few lies get across. Many deceptions are planned; comparatively few succeed. The interior detector sounds an alarm in most people. They are protected.

But there is among young men a native kindness which prevents them revealing the impostor to himself. When it is said that very few lies get across, that is true; but the liar does not know it; people whose detector warns them do not always tell him what they think. They sometimes act as if they believed the lie—and so, insincerity creeps in from the other side, too.

The young business man will more fully trust the older man who does not flatter him and who does not follow his flattery with presumptions on the young man's favor. Thousands of people are that way: they pay a compliment, and they believe that constitutes an admission ticket to special privileges. Deny them the privilege, and they go away saying quite opposite things about the person they hoped to "work." It is the meanest kind of cadging, this passing of compliments, and then waiting until the complimented man is so committed by the reception of the praises that he cannot say "no" without embarrassment. That is the meanest kind of trickery. But young men who have been tricked that way soon learn the technique of it and are on their guard.

A certain delicacy of character would teach the self-seeking person that it is a vast presumption to offer praise to anyone, and the only consideration that can justify it is its sincerity and unselfishness. Otherwise, it is a profanation of one of the finest forms of human relationship.

If a young man in business is wise he will pay less attention to those who flatter his self-esteem, and more to those who stir his energies. A good, well-balanced critic who is looking to the success of the work and not to the feelings of the men who may be at the head of it, is the best kind of friend for a young business man to have. And if the young business man is keen he will see that such a one's interest and attention is the most real, yet the most delicate form of friendship and praise. It is strong. It is based on frankness. *AND* it will be there though failure and unfavorable criticism overwhelm the project.

Divide between your flatterers and your friends, and you already have a chart by which to sail.

THE meanest kind of thief is the man who steals another's good judgment by flattering him. Some people are so susceptible to praise that, like stroked kittens, they just lie down and roll over whenever they are offered a compliment. The difference between the flatterer and a friend is that the former wants to buy something with pleasant words, and the latter wants to share his mind with you. There has been altogether too much dependence on "smooth talk" in business. If money had depreciated in value as much as words have, there would be very little business done. A man's word of praise ought to be as sound and as good as his word of promise, and that ought to be as good as his bond. The only thing that justifies a compliment these days is that it be detached from any form of self-seeking.

What an Individual Owes a City

By DANIEL F. GARLAND

WRITING material was scarce in the days when Benjamin Van Cleve sat in his log cabin and recorded the events of his village in a rough blank book. Time was precious and it was only in the evenings that he found moments to do his scribbling. The cabin was crudely lighted, and the wavering flame of a tallow dip scarcely sufficed to supplement the blazing brush fire on the hearth. Benjamin could sit with his diary on his knees, while often the hunters babbled around him, relating the experiences of the day. But, despite poor illumination, despite pressure for time and despite interruptions, Benjamin Van Cleve kept up his diary for twenty-six years—a diary which, in modern times, has served as a pioneer history of the city of Dayton.

Fifty years later another notebook played a part in the development of the Ohio city. Benjamin Van Cleve's son John was a bachelor. The village to which his father had come as a pioneer to bring civilization to the Ohio Valley, was now a good-sized town—a town which took the place of home and family to Benjamin Van Cleve, the original settler. John Van Cleve's heart interest was wrapped in its welfare, and the stately old gentleman rarely went forth for a stroll without carrying with him a small memorandum. Between its covers he jotted down suggestions—suggestions for municipal improvement. His eyes would rove up and down the landscape, an idea would strike him, and it would be recorded before he had a chance to forget. It was he who planted the tall rows of trees on the main street, the levee and the boulevard. To his enthusiasm Dayton owes the starting of its public library system. From his private shelves, John Van Cleve loaned book lovers his choicest volumes.

The picture of these two pioneer examples of municipal loyalty reverts to mind when the subject is brought up of what an individual owes his city.

The majority of average-minded persons seem to believe they do a city a great favor when they select it as their place of abode, and that in return the city owes them the debt—that it should prove its gratitude by rendering utility and public conveniences.

Every individual owes something to his or her city. Some owe more, some owe less. There are men and women who have derived nearly all their success from the city in which they make their home—the city furnishing the field for their life work.

The individual in these days is beginning to realize and to discharge this debt of obligation. However, a very large majority of people still pay taxes with scowls and complaints. They literally grab all they can from city life and hold it in selfish use without regard for others, oblivious as to whether the remainder of the city folk live or die.

There are men who have amassed fortunes by shrewd purchase of central properties which the tax assessor has kept on a low taxation basis, and who have held these properties out of fitting use till they have multiplied in value three-fold, four-fold, ten-fold and even a hundred-fold, and then have pocketed the unearned increment and chuckled while they did it. There are dozens of such citizens in every community who farm the city, but who never enrich it; take everything out of it they can get and put only as much back into it as they legally must.

Some years ago in Dayton, one of the newspapers undertook to exhibit this type of citizenship by showing how much certain downtown properties had been assessed for taxation and for how much they were held by the owner for sale, or how much the owner actually received. One particular piece of property was on the tax duplicate list for just one-seventh of the price for which it had been sold. It had been taxed for $6,000 and had been sold for $42,000. The issue of the paper announcing this state of affairs roused a commotion among the real estate leeches who were sucking the life-blood out of the city, and they put a total quietus on the editor.

Every man owes time, service and money to his community. Instead of likening the city to our servant we should consider ourselves the servants of the city.

The minister, physician and schoolteacher give more for nothing than do any other class of servants. The profession of the physician and minister requires them to answer every demand for need which is made upon them. The teacher, too, sets a high standard of service. Those engaged in these three callings pay their debt more fully to the community than do the majority of men in other walks of life. But on the other hand, the community into which they throw their endeavor furnishes the field in which they earn their livelihood.

Take, as a fourth class, the merchant! His business depends upon the buying power of the public. Continuous employment at a living wage; general health; comfortable and happy homes; and good public utilities go toward trade increase. The merchant, then, should interest himself in everything which will promote these factors. The same demand is upon the banker and the jobber. Flourishing trade depends upon flourishing citizens.

Success for the manufacturer is dependent upon efficiency in man power. Efficient man power cannot be secured in any given community unless that community furnishes good organization in government; adequate, sanitary housing conditions and convenient transportation facilities.

The workman who comes to his bench or machine from a badly ventilated hovel by means of a tumble-down transportation service, realizing, as he works, that his children are not receiving a first-class education, is not the man whose output will be greatest. But the laborer who resides in a "model village" or who is supplied with a comfortable home, the laborer who rests assured that the city government under which he lives is neither extravagant nor inefficient; and who, by means of an up-to-date system of transportation, is not obliged to waste needless time in an over-crowded street car, is the man whose endeavor will go toward enriching the industry in which he is employed. The former can never be a first-class producer of wealth. Therefore, the manufacturer, if he thinks at all, cannot escape realizing a deep sense of obligation to his community.

Dr. D. F. GARLAND, Director Public Welfare at Dayton, Ohio.

In 1914, after twenty-three years of active work as a Lutheran minister, Dr. Daniel Frank Garland retired from the pulpit to become director of the department of public welfare—a new municipal office of the city where he was preaching, Dayton, Ohio. From the first, Dr. Garland has dedicated his life to others, maintaining the high ideals of man's duty to man and attempting to bring about a better social condition of life. He was born in Perry County, Pennsylvania, July 10, 1864. For fifteen years he held a pastorate at Dayton, Ohio. In 1912, Dr. Garland went abroad to study and investigate welfare work, municipal government, and the garden cities of Europe. Two years later he retired from the ministry to bring about a practical application of the theories of which he had preached. He not only served as welfare director, but was trustee and director of social agencies and municipal enterprises, as well as on state boards. It was he who federated the work of municipal charities, and it was he who organized a bureau of municipal research for Dayton. He was one of the seven members of the state commission appointed to investigate health insurance and old age pensions, and is a director of the Ohio state board of efficiency and the Ohio public health association.

Now that we have briefly defined the debt which the capitalist, the employer and the property owner owe to their city, let us consider the case of the employe, the tenant and the person living on an average salary or income. Financial demands upon them may not be so exacting. But that which they cannot give in money may be donated in time and service.

Dayton, for instance, and the city is only used as an example (there are many others like it) has split itself into various sections and neighborhood interest is promoted through what is known as "The East End Citizens League," "The West Side Citizens League" and community clubs and improvement associations for other suburbs. At these informal gatherings neighborhood problems are discussed in an informal manner. Plans for neighborhood betterment are made with the neighbors voicing their sentiments. Dayton is one of many cities which has divided itself into welfare associations. Active participation and active interest in the meetings is a suggestion for payment in part of the municipal obligation, for a discharge of neighborhood duties means, in the end, the accomplishment of the general welfare in the city.

In the days of early Dayton every household possessed a fire bucket which hung on the back porch. In case of a blaze a human chain was stretched from the well to the burning building, while every man, woman and child co-operated to extinguish it before it could do further damage. Nowadays, most communities, even the smaller ones, possess their own fire department, or are near enough to larger cities to summon aid from them. But the story serves as an illustration of community spirit.

Co-operation is as important now as it was then. "United we stand, divided we fall." Numerous cities hold "Clean Up Week." Whole suburbs want to stage decorative campaigns to beautify their localities. In such events—co-operate! Co-operation is one of the ways by which the individual may discharge his debt to the city. Co-operate, if it only means the planting of a flower garden or the painting of a porch. In return for such trivialities property valuations soar and in the end the city has repaid its servitors for their trouble.

Co-operate with your city government. Lend your city officials your loyal support! Neither wealth nor social standing is required for the extension of a helping hand.

Public welfare is a community expression of the spirit of mutual helpfulness. Individuals should feel that the city has a heart as well as a body, that it is a spiritual entity as well as a physical organism. We have a long way to go before we reach the ideal city. It lies far ahead, but it is a goal worth striving for, the city of our dreams, a great center of throbbing life, of light and joy and health and happiness, a city where social justice and the common good are ever the highest objects of human aspiration.

In Dayton a department of public welfare was provided to manage all city charitable, correctional and reformatory agencies; to supervise recreational facilities for the city, including parks and playgrounds, public amusements and entertainments; to promote public health; and to advance public welfare in general. The department was formed in 1914 when Dayton's charter provided for a city manager form of government.

There are too many bureaus and subdivisions in the department of public welfare to discuss them all separately. It includes divisions of health, recreation, parks and correction; and bureaus of legal aid, free employment, medical service, sanitation, laboratory, food inspection and community country clubs. We can only dwell briefly on the undertakings of some of its branches.

Both customers and food handlers are co-operating in friendly spirit with the bureau of food inspection. There are 6,700 food handlers in Dayton. The city's supply of milk is handled by 750 dairies and until this autumn there were twenty-seven slaughter houses which underwent little or no inspection.

Every month the division of health publishes a small bulletin, distributed to the citizens. This bulletin prints long lists of names of dairymen in which they are classified according to their ratings as determined by laboratory tests and investigations; reports on sanitation; analysis of ice cream samples; and restaurants graded along lines of sanitation and cleanliness.

The following story illustrates the spirit of mutual helpfulness with which these bulletins meet. Mrs. X noticed that her milkman's standing was not as high one month as usual. She mentioned the matter to him. Other customers did likewise. The milkman did more

than explain! He set to work to improve his rating, and the next month his name headed the list. In giving poor service he lost trade; in giving his best he gained business. Housewives and food handlers know and study these bulletins for information.

Time and service and money have been expended by individuals to develop the city's recreational facilities. The money, perhaps, has been given by a few public-spirited men and women who have presented the city with parks and playgrounds and vacation homes. Time and service have been bestowed by them and by others. Clubwomen act as volunteer chaperones at the Saturday night dances arranged through the summer months at the community country clubs. Younger girls work to feed and entertain the underfed vacationists selected to spend a much-needed outing on the vacation farm. Even the woodsy little camps speak for the spirit of co-operation. There are fifteen of these—all of them open to the picnickers, with the latter co-operating in their upkeep by cleaning up before their departure.

Every community has its fairy godmother! Usually the mythical character is of masculine variety! Once in a while, of the true sex!

For instance, the name of George Eastman stands out in connection with Rochester, New York. At present Mr. Eastman is paying the expenses of a clinic at which thousands of school children are having their adenoids removed, with Mr. Eastman paying the bills. He appropriated a large sum to erect a chamber of commerce building. He gave his city a college of music; and has joined the Rockefeller Foundation so that Rochester might enjoy the benefits of a college of medicine and surgery.

Samuel Mather is one of Cleveland's fairy godfathers. He was the philanthropist who organized the first community chest—a project which Dayton was one of the first cities to adopt.

Robert E. Speer loaned Denver the helping hand. Mr. Speer is dead now, but it was during his term as mayor that he developed that keen sense of responsibility in Denver residents which transformed a city of ordinary appearance into a beautiful and desirable place to live.

Colonel Nelson was responsible for much of Kansas City's park and boulevard system; and to Charles Wacker, president of the Chicago Plan Commission, the Windy City owes much of its lake frontage improvement and the widening of numerous streets.

In Dayton, the "Lord Bountiful" is John H. Patterson. Mr. Patterson has fulfilled his municipal obligations far more extensively than has the average rich man. He presented the city with more than half of its 560 acres of park land. He gave it two community country clubs. He established five of the fifteen picnicking camps, and he made possible a community golf course, urging the playing of golf as the healthiest form of exercise.

Patterson organized garden work in 1894 and provided a plot of ground, tools, seed and an instructor for boy gardeners. His scheme to turn vacant lots into flower or vegetable gardens, met with co-operation, and it is estimated that nearly 3,500 children have gardens. Every year an annual garden picnic is held, at which prizes are distributed. The movement not only yielded produce valued at $75,000 last year, but has helped to beautify the city.

Once upon a time Miss Belle Eaker lived in an old-fashioned square house in the heart of Dayton. Her father had made a fortune in the city, starting as a general storekeeper when it was little more than a village.

"What does she do with her money?" queried her friends. But her financial plans were never revealed until she died, when her will stated that her wealth was to go toward the founding of a Young Men's Christian Association, and a boarding-home for working girls—now run by the Y. W. C. A. She had paid the debt to the city which had represented the field for her father's endeavors.

In the same town where Miss Eaker lived, a band of public-spirited women united to start a lunchroom twenty-five years ago. The Young Woman's League was not a money-making corporation. Its object was to provide a nourishing noonday meal for the store clerk and the office employe at low cost. Some of the organizers have grown white-haired in the service, but they still continue to volunteer, making possible that hot, appetizing luncheon for the toilers of the weekly pay envelope.

Dividends? Their investment is Time and Service. Their dividends consist of the satisfying knowledge that they have promoted community welfare. What has been done in one town can be copied by another. Every community has enough public-spirited men and women who are willing to take the first step forward. The small town has as much need of community spirit as the city and the individual's debt is just as great.

"Cast your bread upon the waters, and it will come back to you after many days." Render your city service and it, in return, will repay you for your gratitude.

The City—and the Individual's Debt

1

2

3

4

5

1 and 2. Beautification of private property is one way in which an individual may pay part of his debt to his city. Pictures 1 and 2 show the same back yard before and after planting. Frequently whole communities will band together in a "Clean Up Week" or a "City Beautiful Campaign" and the resident who neglects his rôle during these events not only is a civic slacker, but suffers a personal loss. His lawn is the blot upon the landscape; planting of flowers and shrubbery sometimes have raised the property values of an entire neighborhood.

3. John H. Patterson has paid his debt to Dayton, Ohio, by presenting the city with more than half of its 560 acres of park land; with two community clubs; with five of its fifteen picnicking camps; with a community golf course. Picture 3 shows the playground at one of the community country clubs.

4. "The Old Barn Club" where club women and society matrons chaperone the dances so that the standard of attendance may not be lowered; and to which, for a dollar membership, any Daytonian may belong.

5. Hills and Dales, Dayton's beautiful park, is dotted with rustic camps to accommodate the picnickers. The camps may be engaged in advance, by communication with the city welfare department. The only requirement is that they be left as they are found—neat, clean and tempting, with cooking utensils washed and put away and with the debris picked up and carried off the premises.

Jewish Supremacy in Motion Picture World

The Marvelous Propaganda and Profit-making Powers of the "Screen" Are Deftly Handled by Adept Pro-Semites

A LITTLE "Who's Who in the Motion Picture Industry" would make a valuable department in the movie theaters' printed programs, but it is not pleasant to think of what would happen to the manager who should print one. There is a strange confusion in the Jewish mind, a struggle between a desire to remain unidentified and a desire to be known. Sometimes they measure friendship by the depth of the silence about their being Jews; sometimes by the amount of open laudation. To say a man is a Jew is sometimes to be villified as an "anti-Semite," and sometimes to be honored as "a friend of our nation."

In what is said now, the only purpose is to inform "movie fans" of the source of the entertainment which they crave and the destination of the millions of dollars which they spend. When you see millions of people crowding through the doors of the movie houses at all hours of the day and night, literally an unending line of human beings in every habitable corner of the land, it is worth knowing who draws them there, who acts upon their minds while they quiescently wait in the darkened theater, and who really controls this massive bulk of human force and ideas generated and directed by the suggestions of the screen.

Who stands at the apex of this mountain of control? It is stated in the sentence: The motion picture influence of the United States—and Canada—is exclusively under the control, moral and financial, of the Jewish manipulators of the public mind.

Jews did not invent the art of motion photography; they have contributed next to nothing to its mechanical or technical improvement; they have not produced any of the great artists, either writers or actors, which have furnished the screen with its material. Motion photography, like most other useful things in the world, is of non-Jewish origin. But by the singular destiny which has made the Jews the great cream-skimmers of the world, the benefit of it has gone not to the originators, but to the usurpers, the exploiters.

Who is who in the motion picture world? The names of the leading producing companies are widely known: The Famous Players; Selznick; Selwyn; Goldwyn; Fox Film Company; The Jesse L. Lasky Feature Play Company; United Artists' Corporation; The Universal Film Company; The Metro; Vitagraph; Seligs; Thomas H. Ince Studios; Artcraft; Paramount, and so on.

Jewish Personnel of Picture Control

THE Famous Players is headed by Adolph Zukor. Mr. Zukor is a Hungarian Jew. He was a fur dealer in Hester street, and is said to have gone from house to house selling his goods. With his first savings he went into the "nickel" theater business with Marcus Loew. He is still in his forties and immensely wealthy. He is conceded to be the leader of the fifth largest industry in the world—an industry which is really the greatest educational and propagandist device ever discovered.

The reader will not be deceived by the use of the word "educational" in this connection. Movies are educational, but so are schools of crime. It is just because the movies are educational in a menacing way that they come in for scrutiny.

Zukor's control extends over such well-known names as Famous Players-Lasky Corporation, The Oliver Morosco Photoplay Company, Paramount Pictures Corporation, Artcraft Pictures, all of which have been absorbed within the past five years.

It is commonly supposed that the United Artists' Corporation is a non-Jewish concern, but according to an article in the *American Hebrew*, the head of this photoplay aggregation is Hiram Abrams. The United Artists' Corporation was formed several years ago by the Big Four among the actors—Mary Pickford, Douglas Fairbanks, Charlie Chaplin and David Wark Griffith, and notwithstanding the fact that Charlie Chaplin is a Jew, the company was regarded by the public as being non-Jewish. Hiram Abrams is a former Portland, Oregon, newsboy, and graduated from that wholesome occupation into the position of manager of a "penny arcade." He was one of the founders of the Paramount Pictures Corporation, and became its president.

The Fox Film Corporation and the Fox circuit of theaters are under control of another Hungarian Jew who is known to the American public as William Fox. His original name is said to have been Fuchs. He also began his artistic and managerial career by running a "penny arcade." The penny arcade of 15 and 20 years ago, as most city-bred men will remember, was a "peep show" whose lure was lithographed lewdness but which never yielded quite as much pornography as it promised.

Fifteen years ago William Fox was in the clothes sponging business. He also is still in his early forties, is immensely wealthy, and one of the men who can pretty nearly determine what millions of movie fans shall think about certain fundamental things, what ideas and visions they shall entertain.

Marcus Loew also reached fame via the penny arcade and cheap variety vaudeville routes. He went into pictures and is now said to be the active head of 68 companies in various parts of the world. He is in the neighborhood of 50 years old. Loew controls the Metro Pictures Corporation.

The names of Marcus Loew and Adolph Zukor are closely linked in the history of the movies. Both were in the fur business, and both were partners in the first penny arcade venture. Zukor went the way of pictures exclusively, although he later made investments in Loew's enterprises, but Loew went into variety and vaudeville of the type which is now to be found in the less desirable burlesque houses. From this he developed great entertainment enterprises which have made him a name and a fortune. The theaters he personally controls now number 105.

From Oshkosh to Universal City

AT THE head of the Goldwyn Film Corporation is Samuel Goldwyn who is described as having been engaged "along mercantile lines" until motion pictures won his attention. In company with Jesse Lasky and Cecil DeMille he organized a $20,000 corporation in 1912. In 1916 he had prospered so greatly that he organized a $20,000,000 corporation with the Shuberts, A. H. Woods and the Selwyns, the purpose of this latter company being to screen the works of prominent non-Jewish writers—a matter of which more will be said presently.

The Universal Film Company, known everywhere through the name of Universal City, its studio headquarters, is under the control of Carl Laemmle. It would seem, from a reading of Who's Who, that Laemmle was his mother's name. His father's name is given as Julius Baruch. He is a Jew of German birth. He was manager of the Continental Clothing Company of Oshkosh until 1906, in which year he branched out into pictures, taking his first stand in a small Chicago motion picture theater. Laemmle conceived the idea of fighting the "trust." He bought an enormous tract of land near Los Angeles and built Universal City as the headquarters of his production work.

The Select Pictures Corporation is headed by Lewis J. Selznick, who is also head of Selznick Pictures, Incorporated. He was at one time vice president of the World Film Corporation. With him are associated a number of members of his race.

This is but to name a few. These are the official heads. Penetrate down through the entire organizations, until you come to the last exhibition of the cracked and faded film in some cut-price theater in an obscure part of a great city, and you will find that the picture business, on its commercial side, is Jewish through and through.

Going the Route of the Saloon

IN THE above notes, reference has been made to the occupations out of which the present arbiters of photo-dramatic art have come to their present eminence. They are former newsboys, peddlers, clerks, variety hall managers and ghetto products. It is not urged against any successful business man that he formerly sold newspapers on the streets, or peddled goods from door to door, or stood in front of a clothing store hailing passers-by to inspect his stock. That is not the point at all. The point is here: men who come from such employments, with no gradations between, with nothing but a commercial vision of "the show business," can hardly be expected to understand, or, if they understand, to be sympathetic with a view of the picture drama which includes both art and morality.

Mr. Laemmle, it will be remembered from a former article, said of his company, "The Universal does not pose as a guardian of public morals or of public taste." This is probably the attitude of other producers, too. But though they avoid any responsibility for taste or morals, they consistently fight all attempts of the state to set up a public guardianship in those regions. A business that frankly brutalizes taste and demoralizes morals should not be permitted to be a law unto itself.

It is very difficult to see how the Jewish leaders of the United States can evade the point that Motion Pictures are Jewish. And with this being true, there is the question of responsibility upon which they cannot very well be either impersonal or silent.

The moral side of the movies' influence need not be discussed here because it is being discussed everywhere else. Everybody who has an active moral sense is convinced as to what is being done and as to what ought to be done.

But the propaganda side of the movies does not so directly declare itself to the public. That the movies are recognized as a tremendous propagandist institution is proved by the eagerness of all sorts of causes to enlist them. It is also proved by the recent threat of a New York "Gentile front," that the movies themselves could prevent any progress being made in the attempt to save Sunday to the American people.

But who is the propagandist? Not the individual motion picture exhibitor on your street. He doesn't make the films. He buys his stuff as your grocer buys his canned goods—and has a far narrower margin of choice. He has hardly any choice in the *kind* of pictures he shall show. In order to get any good pictures that may be distributed, he must take all of the other kind that may be distributed. He is the "market" of the film producers and he must take the good with the bad, or be cut off from getting any.

As a matter of fact, with the "movie bug" so rampant in the country, it is next to impossible to supply enough good pictures for the stimulated and artificial demand. Some people's appetite calls for two or more pictures a day. If working people, they see a show at noon, and several at night. If shallow-pated wives, they see several in the afternoon and several at night. With all the brains and the skill of the country engaged on the task it would be impossible to supply a fresh drama of quality, hot out of the studios every hour, like bread.

Where the Jewish controllers have overstepped themselves is here: they have overstimulated a demand which they are not able to supply, except with such material as is bound to destroy the demand. Nothing is more dangerous to the motion picture business than the exaggerated appetite for them, and this appetite is whetted and encouraged until it becomes a mania.

Like the saloon business, the movie business is killing itself by killing that quality in its customers on which it was built.

Types of Jewish Screen Propaganda

NOW, as to propaganda, there is evidence that the Jewish promoters have not overlooked that end of it. This propaganda as at present observed may be described under the following heads:

It consists in silence about the Jew as an ordinary human being. Jews are not shown upon the stage except in unusually favorable situations. Among the scenes offered the public you never see Hester street or lower Fifth Avenue at noontime. Recall if you have ever seen a large Jewish group scene on general exhibition. After a terrible fire in a clothing factory, the mayor of New York asked a certain motion picture company to prepare a film to be entitled, "The Locked Door," to show how buildings are turned into firetraps by ignorance and greed. The scenario was written by a fire official who knew the circumstances of many holocausts. As most of the fire victims had been sweatshop girls, the scenario included a sweatshop. The picture was made as true to life as possible, so the head of the sweatshop was depicted as a Hebrew. The gentleman who told this incident to a committee of Congress said: "It was no discredit to the Hebrew race. We all know they have been the fathers of the clothing industry; in fact, they made the first clothes." But all the same, the picture was declared taboo by Jewish leaders. It broke the cardinal rule of silence about the Jew except when he can be depicted under exceptionally favorable circumstances.

This ill-concealed propaganda of the Jewish movie picture control is also directed against non-Jewish religions. You never saw a Jewish rabbi depicted on the screen in any but a most honorable attitude. He is clothed with all the dignity of his office and he is made as impressive as can be. Christian clergymen, as any movie fan will readily recall, were subjected to all sorts of misrepresentation, from the comic to the criminal. Now, this attitude is distinctly Jewish. Like many unlabeled influences in our life, whose sources lead back to Jewish groups, the object is to break down as far as possible all respectful or considerate thought about the clergy.

The Catholic clergy very soon made themselves felt in opposition to this abuse of their priestly dignity. You never see a priest made light of on the screen. But the

Protestant clergyman is still the elongated, snivelling, bilious hypocrite of anti-Christian caricature. More and more the "free love" clergyman is appearing on the screen. He is made to justify his deeds by appeals to "broad" principles—which really kills two birds with one stone: it degrades the representative of religion in the eyes of the audience, and at the same time it insidiously inoculates the audience with the same dangerous ideas.

The Screen for Mob Rehearsal

IN THE February *Pictorial Review*, Benjamin B. Hampton, a successful picture producer, throws a sidelight on this. He quotes a poster outside a movie show. The text says:

> "'I refuse to live with her any longer. I denounce you as my wife—I will go to HER—my free-lover.' Thus speaks the Rev. Frank Gordon in the greatest of all Free-Love dramas."

You may not depict a Hebrew as owner of a sweatshop—though all sweatshop owners are Hebrews; but you may make a Christian clergyman everything from a seducer to a safe-cracker and get away with it.

There may be no connection whatever, but beholding what is done, and remembering what is written in the Protocols, a question arises. It is written:

> "We have misled, stupefied and demoralized the youth of the Gentiles by means of education in principles and theories, patently false to us, but which we have inspired."—Protocol 9.
>
> "We have taken good care long ago to discredit the Gentile clergy."—Protocol 17.
>
> "It is for this reason that we must undermine faith, eradicate from the minds of the Gentiles the very principles of God and Soul, and replace these conceptions by mathematical calculations and material desires."—Protocol 4.

Two possible views are open to choice: one, that this constant caricature of representatives of religion is simply the natural expression of a worldly state of mind; the other, that it is part of a traditional campaign of subversion. The former is the natural view among uninformed people. It would be the preferable view, if peace of mind were the object sought. But there are far too many indications that the second view is justified, to permit of its being cast aside.

The screen, whether consciously or just carelessly, is serving as a rehearsal stage for scenes of anti-social menace. There are no uprisings of revolutions except those that are planned and rehearsed. That is the most modern fruit of the study of history: that revolutions are not spontaneous uprisings, but carefully planned minority actions. Revolution is not natural to the people, and is always a failure. There have been no popular revolutions. Civilization and liberty have been set back by those revolutions which subversive elements have succeeded in starting.

But if you are to have your revolution, you must have a rehearsal. In England, the whole process of sovietizing the country has been set forth on the stage, as in vivid object lessons. In this country they have rehearsals by parades, by starting marches through factories and up to the offices, by importing lecturers who tell just how it was done in Russia, Hungary and elsewhere. But it can be done better in the motion pictures than anywhere else: this is "visual education" such as even the lowest brow can understand, and the lower the better.

Indeed, there is a distinct disadvantage in being "high-brow" in such matters. Normal people shake their heads and pucker their brows and wring their hands and say "we cannot understand it; we simply cannot understand it!" Of course they cannot. But if they understood the low-brow, they would understand it, and very clearly. There are two families in this world, and on one the darkness dwells.

Reformers, of course, heartily agree with this as far as criminal portrayals are concerned. Police protest against the technique of killing a policeman being shown with careful detail on the screen. Business men object to daily object lessons in safe-cracking being given in the pictures. Moralists object to the art of seduction being made the stock motif no matter what the subject. They object because they recognize it as evil schooling which bears bitter fruits in society.

Well, this other kind of education is going on too. There is now nothing connected with violent outbreaks which has not been put into the minds of millions by the agency of the motion picture. It may, of course, be a mere coincidence. But coincidences also are realities.

The Snare of Pro-Semitism

THERE are several developments proceeding in screendom which are worthy of notice. One is the increasing use of non-Jewish authors to produce Jewish propaganda. Without using names, it will be easy for each reader to recall for himself the more popular non-Jewish authors whose books have been screened by the Jewish producers, and who are soon after announced to have a new photoplay in preparation. In several cases these new photoplays have been sheer Jewish propaganda. They are the more effective because they are backed by non-Jewish names famous in the literary world. Just how this state of affairs comes about it is not possible now to say. How much of it is due to the authors' desire to enter the field of pro-Semitic propaganda, and how much of it is due to their reluctance to refuse amiable suggestions from movie magnates who have already paid them liberal sums and are likely to pay them more is a question. It is not difficult to bring oneself to believe that "anti-Semitism" is wrong. Everybody knows it is. It is not difficult to bring oneself to an admiration of Israel. Every writer is happy in idealizing an individual or a nation; it is a pleasure to write about an altogether admirable Jewish hero or heroine. And so the non-Jews are writing Jewish propaganda ere they are aware.

The flaw, of course, is here: in avoiding anti-Semitism, they fall into the snare of pro-Semitism. And one is as inconclusive as the other.

The End of the Movie Star

ANOTHER development is one which movie fans have doubtless noticed: it is the abolition of the "star" system. Readers of this series will recall that it was this same sort of thing which marked Jewish ascendancy in the control of the legitimate stage. Not long ago the full glare of movie publicity was thrown upon names and personalities—the Marys and Charlies and Lulus and Fatties of screen fame. The name was headlined; the star was featured; it did not matter what the theme of the play was—suffice it that it was "a Chaplin film," or a "Pickford film," or whatever it might be.

The motion picture "industry" has reached its present importance because of the exaltation of the "star." But this has its inconveniences, too. Educate the public to demand a star, and that demand will eventually rule the business. Jewish control will not permit that. The way to break the control which the public may exercise through such a demand, is to eliminate the stars. Then all pictures will be on the same plane.

This is occurring now in filmdom. Some of the stars have taken the hint and have set up their own studios. But steadily the doctrine is preached throughout fandom that "the play's the thing," not the star. You don't see so many star names before the theaters; you see more and more the lurid names of plays. The star is being sidetracked.

There is a triple advantage in this. The bloated salaries of the stars can be eliminated. The public can be deprived of a point on which to focus a demand. Exhibitors can no longer say, "I want this or that," even within the narrow margin they recently had; they will have no choice because there will be no choice; the business will be a standardized "industry."

These, then, are some of the facts of the American motion picture world. They are not all the facts, but each of them is important. Not one can be overlooked by students of the influence of the theater. Many a perplexed observer of everyday affairs will find in these facts a key which explains many things.

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

In an editorial accompanying the recent "protest" signed by the heads of all the Jewish organizations in this country, the Bridgeport (Connecticut) *Times* says: "It may be said in passing that if the Jews of the world are one-half as competent as THE DEARBORN INDEPENDENT says they are, *it would probably be a good thing for the world if they did run it.* . . . It is probable that for their numbers the Jews provide more men of ability, more of talent and more of genius than other races. This would be a natural result of the operation of the law of the survival of the *fittest*."

"America is the Jew's Palestine and Washington, D. C., his Zion. I suspect that if you plant the blue and white flag of Zionism on one side and the red, white and blue of the United States on the other and demand of the Jew, 'Choose ye this day which you will serve,' there will be but one answer—it is America."—Pastor Purvis, Philadelphia, reprinted in Chicago *Israelite*.

Before and since the Jewish-Bolshevist coup at Petrograd, it was known to the United States and to the Allied Powers that the Bolshevists were able to count on important co-operation in their plans in the Scandinavian countries. Leading banks holding close relations to prominent Jewish international banking houses in Europe and America had active share in the financing of the revolution in its beginnings, and during the recent negotiations between Great Britain and the Soviet Republic for the resumption of trade relations, the Bolshevists made use of Scandinavian banks in which they had large amounts of gold on deposit. Evidence multiplies that Scandinavia, in which the Jews reaped a rich harvest during the war through immensely increased imports of food and raw materials from America turned over to Germany at several hundred per cent profit, has been selected as a favorable stage for playing the next big act in the drama of Jewish world politics. According to the *Verdensgang* of Christiana, plans for a sensational revolution in Norway have been discovered by the secret police. It seems that the Norwegian Labor party, which joined Lenin's Moscow Internationale a year ago, had planned to start the uprising by setting fire to the enormous stocks of lumber in Christiana, taking advantage of the diversion of attention the blaze would cause to seize the barracks, police headquarters, and the telephone and telegraph stations. After arresting the members of the cabinet and military and naval commanders, the Bolshevists were telegraphically to advise their agents in the provinces of the success of the revolution and the conquest of the capital. While the government is taking utmost precautions, there is much nervousness throughout the country.

The immigration board that recently examined a highly respected member of the Russian nobility who was suspected of being "anti-Semitic," was composed of three Jews and one American. Not only is the United States Government being put into the position of saying that only pro-Semites can be admitted to the country, but it is also placing in the hands of Jews the discretionary powers relating to that attitude. It is not too much to say that a continuance of such a policy will have a great influence in fixing public opinion.

In a recent press interview, David Wark Griffith, film producer extraordinary, said that some of the reputed salaries of movie stardom are "purely legendary," although many actors are still "making exorbitant demands and being turned down." He added the prediction that within ten years, possibly in half that time, people will be paying five dollars each to see one motion picture running two and a half or three hours, as they do now for the best stage plays. The smaller pictures, he said, would then occupy a position analogous to that at present occupied by vaudeville. As an illustration of the confidence that financiers have in the future of the "industry," Mr. Griffith said that a group of big men is now planning to spend $2,250,000 in making one picture, the book rights alone to cost $600,000.

"No matter how far a Jew and Jewess can be removed from each other in everything but race, there is always a warm tunnel of brotherhood stretching out between all Jews; but the glacial undercurrents of racial antipathy between Jew and non-Jew cannot be tepified even by the hottest and fiercest rays of the sun of love! Statistics and the divorce courts prove this."—Chicago *Israelite*.

Pola Negri, the star of "Passion," has signed a three-year contract with Ben Blumenthal and Samuel Rachman in behalf of Famous Players-Lasky Corporation at $250,000 a year, the largest sum ever paid to any actress in Europe. The contract calls for six pictures a year, three of them to be made in America. In addition to the salary named, Frau Negri is to have her expenses in crossing the ocean and $500 a week extra while in this country, her wardrobe also being provided. This according to the *Berliner Zeitung-am-Mittag*.

The following letter is printed in the New York *World*:

To the Editor of the *World*:

The *World* bears the reputation of being fair on all questions of public interest. Therefore, we presuppose no opposition to the publication of this letter since it is a matter in which the public are deeply interested. Many protests have recently appeared in the press from Jewish societies claiming that publishers of "The Protocols" are anti-Semitic. Nothing is further from the truth, so far as we are concerned.

We publish an edition of "The Protocols" because we believe they contain the program for world domination which is being now carried out in Russia.

In "Who Rules Russia," which we also publish, the name and race of every Commissary (545 in all) are given. Of the total of 545, there are 450 Jews and only thirty Russians. Over 400 are gathered from all quarters of the globe, and out of these 500 "foreigners" has been formed the Moscow Internationale, which plans the domination of the world. The reader must judge for himself what race presumes to dominate.

—The Beckwith Company

The Jewish press of the United States continues to pour out the viles of its wrath on the famous Gilbert K. Chesterton. It is the first introduction most of us have had to Mr. Chesterton, "the anti-Semite, and Jew-baiter." We had known that Mr. Chesterton was not afraid to insert the word "Jew" in his writings, nor yet to wonder where the Judaization of the British Empire was to cease, but we had supposed this only marked him as an open-eyed Britisher. Has it come to the point where to be concerned about the fate of one's own country is to be an anti-Semite? It would seem so.

Selling Texas Cattle by United States Mail

By H. O. BISHOP

THE title of this article may possibly recall the exciting and amusing experiences of Mr. Burleson's rural carrier who had a bulldog and a mess of liver in the same delivery; also the difficulties of the carrier who tried to convey a bale of new alfalfa and a six-months-old calf in the same buckboard without getting them inseparably mixed.

At first blush this story of selling cattle by mail may seem equally incredible to some readers.

Way down in Texas on the famous S. M. S. ranch of half a million acres, 12,000 calves are produced every year. These mild-eyed little bovines are permitted to frisk about from one place to another over this colossal pasture chaperoned by their fond mammas until they reach the age of six months (which in calfdom is the equivalent of sweet sixteen of girldom), when they are shipped to new owners all over the United States, who have bought them by mail, cheerfully paying fancy prices for them, despite the fact that they have never seen them. So satisfactory are these cattle-by-mail sales of the S. M. S. ranch that not a single complaint has been registered by a distant purchaser during the eighteen years this plan has been in operation. It is asserted the great percentage of buyers follow up their checks with letters declaring the cattle to be even better than they anticipated.

Year after year, the mail purchasers of these cattle, after fattening them into finished beeves, have been enabled to sell them at top-notch prices. They are likewise invariably found among the prize winners in the car lot finished beef classes at the great Chicago International Show held annually.

The steer cattle go in the main to that portion of the country known as the great Corn Belt. The breeding heifers are sold by mail to farmers and stock raisers in all sections of the country, going even to Maine. New Hampshire, New York and Georgia in the East, and to California and Oregon on the Pacific Coast, and in all to 30 different states.

The history of the phenomenal success of this unique mail order business may be summed up under two great divisions: First, "Having the Goods"; second, "Giving a Fair Deal."

Texas cattle still carry with the general public the memory of the primitive longhorn, which was not much more than a scrawny batch of hide, hair, ribs and horns. As a matter of fact, Texas began 50 years ago to improve its cattle by the introduction of purebred beef strains with Herford blood in preponderance. By the year 1880, the improvement was so marked that it was decidedly noticeable in the markets. By 1900 the longhorn had become a curiosity. For the past 15 years, Texas as a whole has undoubtedly carried a greater proportion of well-bred beef cattle than any other state. When the ninth cross is reached, cattle show a fraction of .999 pure blood. The S. M. S. herd, and hundreds of other Texas herds, show from 10 to 15 crosses.

Frank S. Hastings is the business genius who evolved and made good the remarkable scheme of selling vast numbers of cattle annually by mail. He has been manager of the S. M. S. ranch for the past eighteen years. When he went to Texas in 1902, he immediately began a campaign for putting the well-bred Texas steer more definitely on the Corn Belt map. He soon learned that the buyer who wanted one or two cars did not feel justified in the expense and loss of time to make a trip to Texas personally to select the cattle he wanted. This gave Hastings a valuable hunch. He embarked upon a careful line of publicity asking for experimental mail order shipments. Within five years he established cattle-by-mail on a firm basis, clearly demonstrating that cattle could be described so accurately by correspondence that the buyer got what he expected—and then some.

Obviously it was impractical for the S. M. S. ranch to go out and gather a single car as ordered from a single customer in a far-distant state. A selling campaign was therefore waged several months in advance of the usual time for shipping. Standards were established in every class—all of each class were gathered and trimmed to a standard as though one buyer was taking the whole bunch. Then they were chopped off into car lots and shipped in train loads, each car billed to its individual buyer, and the train sent to some diverging point such as Kansas City or St. Louis, in charge of an attendant, from which point they had usually a comparatively short distance to go. As a case in point, J. W. Frazier, of Rariden, Ill., began buying by mail ten years ago and has bought each succeeding year. He fattens the stock with corn and then ships them to the Chicago market. He has never been within a thousand miles of the S. M. S. ranch, conducting his purchases entirely by mail. His finished cattle rarely miss topping the market, and in 1918 his mail-purchased cattle won the Grand Sweepstakes Championship in the fat car lot division of the Chicago International over all ages and breeds. Three times in other years he has stood next to the top.

The main business of the S. M. S. ranch is the sale of calves born before June first and shipped about November first of the same year, which are carried by Corn Belt feeders on full feed until the following June to December as the market may suggest. They usually show weights of 1,000 pounds or more in November of the year following their delivery, and usually weigh empty out of the cars at destination when received 325 pounds, or equal to 400 pounds pasture weight in Texas. They pick up rapidly after reaching their destination, and are usually back to Texas form in two weeks. A comparison, therefore, against Texas weights shows a gain of about 600 pounds in one year as a result of the corn feeding. This process is known as "Baby Beef Making," and is described by the United States Department of Agriculture as the most economic method of beef production, and of ideal quality.

In filling mail orders Mr. Hastings does not permit his men to do any picking or choosing. Every buyer gets the S. M. S. breeding just as it comes, which means that cattle breeding on this ranch is just as much standardized as the product of a great automobile factory or a steel plant. This standardization is what makes it easily possible to dispose of 12,000 head of cattle annually through the medium of letters and two cent stamps. This improvement of breeding and standardization has been under way on the S. M. S. ranch for the past 38 years.

To conduct a ranch of this magnitude is no small task. It requires the services of 75 expert cowboys and many other employes.

Fifteen acres are allowed all the year round for each head of stock over the yearling period.

An average of 1,200 horses are required to run the ranch.

Texas has long been the great nursery for well-bred beef cattle, and a great factor in supplying the markets of the country with the choicest beef.

The S. M. S. ranch is only one of thousands in Texas producing well-bred cattle, but it is in an exclusive class of its own from a mail order standpoint.

One of the big and exciting responsibilities of a cowboy is to be placed in charge of a train load of cattle en route to market and see that everything goes smoothly. All sorts of things may happen, from being wrecked to getting stalled somewhere where feed and water are scarce. It is then up to the cowboy to take emergency action in protecting the interests of his employer—and he always does.

When it comes to letter writing, cowboys believe in economy and getting right down to facts.

Here is a letter received by Mr. Hastings from one of his cowboys whose train was wrecked:

Caldwell, Kansas, Saturday Morning.

Mr. Hastings.

Dear Boss. 6:30 this morning in going to the stockyards to feed at this place another train run into my stock train, on an open switch. & killed two cows & crippled 4, and the rest of the cows in that car is now all over Town. so I got one car less. & few cows in another car is feeling sore & some of them only got one horn left.

The crew of both train jumped off & myself. so it was no one hurt. It was not enough left of the engine & one stock car to tell the Fait. 8 or 10 of the Kansas cowboys is out all over town picking up our cattle—wish you could see them coming down the street driving one or two of them cows—I think they got about 10 of the cows in a Pen (down in town) & they heard of 5 cows in a cornfield just a little while ago, so I guess they will get most of them back today. I will leave here about 5 P. M. will make tomorrow market.

Yours truly

Dock.

P. S. This R. R. ought to take charge of this whole shipment and pay for same.

P. S. The sheriff shot one cow on the street just a little while ago.

P. S. The cows down in town is making the horses run off with buggys and running all the women out of town.

P. S. I think this will cost the railroad a good deal in this town.

P. S. The Railroad they give me a poor and sorry run.

P. S. They run my cattle 40 hour before this happened without feed—(how about that).

P. S. Personally I am hungry myself now and think I'll go and get me some ham and eggs and pie.

This unusually clear and comprehensive photo of Boston Harbor, taken from the Custom House Tower, shows the various docks and piers, the narrow gauge Ferry and the various freight lines and warehouses.

Old Antioch and the monument to the great educational leader, Horace Mann

Something New in Education

By HOWARD EGBERT

ARTHUR E. MORGAN,

who will try out an experiment in Antioch which will send graduates out into the business world versed in practice as well as theory.

WHEN they speak in these days about something new along educational lines you are apt to find yourself very much embarrassed by the scholarly old gentlemen who have been studying this subject for a half century or more. A good many people honestly believe that the last word has been spoken anent education. They tell you that Princeton is limiting the number of students to 2,000 in order, as President John Grier Hibben avers, to make Princeton a great university, not a big one. This is a departure, of course. Time was when universities had to advertise for students. Now they are going to limit the number enrolled. But other institutions have limited their enrollments before, so, after all, there really isn't anything new about Princeton's recent decision.

Yellow Springs, Ohio, is a rather inconspicuous community, as we judge communities in these busy times. A railroad runs through the village. There are some mills which handle the farmers' wheat. There are a number of retired farmers living on rich agricultural lands adjacent to the community. But generally speaking, Yellow Springs, Ohio, would be the last place in the world where you would look for something new in education. But the Greene County, Ohio, village, nevertheless, is about to stage a "come-back" and historic old Antioch College, of which the brilliant Horace Mann was president and supervised from 1852 until the time of his death, is to be the starting point of this "something new about education" in America. Antioch, by the way, was the first co-educational school in the United States. This feature of its life and active and useful service will not be lost.

Eight years ago the flood waters of the Great Miami River swept many houses and business properties into ruin and a $200,000,000 loss ensued. The men who constituted the flood prevention board in Dayton, Ohio, looked around to get the best engineer they could find. They decided on Arthur E. Morgan, a most capable man, thoroughly familiar with river problems and floods. But Morgan knew something else besides controlling unruly rivers. He was in a definite sense an educator. He wrote much for scientific magazines and he was the author of many books on education and engineering. One morning about six months ago Arthur E. Morgan was notified that he had been elected president of Antioch College in Yellow Springs. That was indeed a surprise because being a college president was about as far away from Morgan's suspicions as being president of the United States. He pleaded he was too busy to mind the affairs of Antioch; that somebody ought to take the job who had plenty of time, and so on. In the end he was converted. But he laid down certain fixed rules governing college affairs in Antioch.

He wanted, first of all, to have members of his board who should measure up to certain specifications which he would, as an engineer, lay down for the board's personnel. He had his way. The new board of trustees of Antioch College, therefore, is a board picked by blueprint specifications. It consists of men who are accustomed to do original things successfully There's the story in a nutshell. On this board, it may be of interest to note in passing, are such men as Henry S. Dennison, President of the Dennison Manufacturing Company, of Boston; Edward F. Gay, formerly Dean of the Harvard School of Business Administration and now president of the New York *Evening Post*; Ellery Sedgwick, editor of the *Atlantic Monthly*; Frank A. Vanderlip, nationally known financier; Jerome D. Greene, former secretary of the General Education Board; Charles F. Kettering, of Dayton, Ohio, famous research engineer and chief engineer of the General Motors Company. There are other members of the board, each in his own way qualified for extremely useful service for the New Antioch. But the list indicates the type of men selected. Of course with such men actively interested in the college its success is assured beyond doubt.

The idea of a vocational school is not new. Men have been taught while they worked for a good many years. This principle is not lost sight of in Antioch, but the college is going to go this idea one better. Antioch will have active industrial plants working right on the college campus. Small business concerns will be invited to establish their enterprises right within stone's throw of the college itself, so that the students may work and study for two weeks or a month at a time. The purpose of the New Antioch is to train young men and young women for proprietorship. In the modern method of education along business lines, the particular object seems to have been to get young people ready for some particular leadership in some one branch of industrial or commercial service. The New Antioch plans to give to men and women the kind of training that will enable them to sit at the big desk and hold the lines that run out in every direction to the various departments of an industry.

Theory is a very good thing in its place. Practice is so much better when it becomes necessary to do something worth while. President Morgan illustrates this point in this way: "A young fellow may go to some school where they teach boys to become great baseball players—pitchers, for an example. This young man may know everything that it is humanly possible to teach a young chap about pitching a baseball. But the chances are this lad when he steps up to throw the first ball would be unsound somewhere along the line of training. And the chances are with only his theory to back him he would be knocked out of the box before an inning was over. Antioch will undertake to perfect both theory and practice, so that its students may go right in and supply a leadership in business that heretofore only proprietors have been able to fill."

Students who are enrolled at the New Antioch will be picked by specifications. It will be no place for the idler. The young man or young woman who is interesting himself in a practical farming course will have access to one or more good-sized farms which the college will purchase. The farmer has to be a proprietor in his business. He buys and sells. He has his farm hands to manage and his business affairs to control. Antioch will provide proprietorship in agricultural lines as well as industrial and commercial channels.

Students at Antioch will be self-supporting when the college once gets under full sway. College study and remunerative work will go hand in hand. There will be a combination of the practical experience with academic study, preferably in the calling for which the student is equipping himself. Technical courses will be taught so as to make them impressive and useful.

As touching the "Machine Shop" course, President Morgan says: "American industry is becoming increasingly mechanical. While our factories are turning out an enormous mass of mechanical appliances, our maintenance system outside of large cities usually is limited to poorly equipped shops. There is room in our country for a large number of independent machine shops for maintaining this equipment and for otherwise serving the mechanical needs of the communities. Such shops would not be 'blind alley' industries, for it takes but a slight change to turn a well-organized one into a factory." Antioch will undertake to teach farming, carpentering, plumbing, painting, electricity, and so on, and students taking these courses will have ample opportunity to practice while they learn. It is proposed to make the student of the New Antioch not only a genius in mechanism, but to equip him with cultural and social assets which are more necessary than some have been led to believe heretofore. After his graduation he should be able at once to undertake the management of a machine shop, or serve an apprenticeship in one, depending upon his maturity and ability.

To be wholly wise one would have to be possessed of both study and experience. The old-fashioned ideas about an academic course will be supplanted by the more meaningful practical course. Actual considerations, after all, are the things worth while in education and the New Antioch proposes to utilize this element in training its students.

It is an experiment, of course. "When we cease experimenting we die," says Mr. Morgan. He knows because he is constantly experimenting. President Morgan is going to select the students. He has chosen more than 20,000 men and women for a variety of jobs, and so he is qualified to know the types which best meet Antioch's specifications.

Manifestly there is something radically wrong with much of the technical training in the country. The young man who finishes a course in this, that or the other subject in a technical school ought to be able, one would think, to step out and take charge of business. Theoretically this is the rule. What does such a young man do? Why some of the best mechanical engineers or civil engineers that colleges have turned out as far as

(Concluded on page 12)

The Crime of the Cities

New Orleans—By H. H. DUNN

ENFORCEMENT of the Eighteenth Amendment is increasing in effectiveness in New Orleans and throughout Louisiana. Agents of the Federal Government charged with its enforcement consider that it is fifty per cent more effective at the end of January, 1921, than it was at the end of June, 1920. As far as these agents know, there is no organized effort at violation of the law in any part of the state, though this state was one of the heaviest consumers of liquors of all kinds prior to the adoption of the Eighteenth Amendment and the passage of the Volstead Act. The state always has been "wet," with saloons allowed to remain open seven days in the week in the majority of the towns and cities. While as many as three men have been found banded together in violations of the law, this unity of purpose has been largely due to convenience, rather than any definite organized attempt at liquor running and selling. Usually such a trio would consist of the man who knew where the liquor supply could be obtained, the man who had the cash capital to buy it, and the man who owned an automobile or a motor boat, in which it could be transported.

Oddly enough, such combinations, with two or three exceptions, have been brought about in the handling of corn "moonshine" whisky, rather than the illegally-imported liquors. Men violating this law, more particularly than violators of other laws, seem to fear numbers, and to work alone more frequently than with other men, in the opinion of the Federal agents. Virtually all the cases of illegal importation of liquor, by means of ships from Canadian or Latin-American ports, have involved only one man, who brought it from on board the ship, and sold it as best he could in New Orleans, Lake Charles, Baton Rouge, or other ports of the States.

About 90 per cent of the illegal sales of liquor discovered in the state have been in New Orleans, the country seemingly accepting prohibition with a more law-abiding spirit than the city. In the country, on the other hand, it is believed that more people are making wine for their own use than in the cities. But the country people are making little whisky or beer, and selling virtually none of what they make. The attitude of the people of New Orleans, according to prohibition agents, is against obedience to the law, and is the greatest handicap the enforcement agents have to overcome. That they are overcoming it, however, is proved, the agents say, by the fact that it is daily becoming more difficult to obtain liquor, either by the drink or by the package, unless the would-be purchaser knows exactly where to go to get it.

The most extensive violators of the law as to making wines for their own use are the French people and the people of French descent, who have been accustomed to their wines all their lives, and who, so long as they do not sell the wine they make, consider that they have not violated the law.

The worst violators of the law as to making and selling so-called "over-night" liquor, as well as in the sale of illegally-imported liquors, are people either direct from Middle Europe, or only one generation removed from there. According to the agents, Russian Jews are first in point of numbers in this form of violation of the law; Slavonians are second, and Italians third.

The "moonshine runners"—that is to say, the men who bring native corn whisky into New Orleans from the stills in the backwoods districts of Louisiana, Mississippi and Alabama—are largely Italians, with a sprinkling of Greeks. These men have to invest more money in their illicit operations, since they have to own automobiles or motor boats, being unable to rent them for this purpose, and have to pay cash for all the liquor they get. The preponderating population of the country of Louisiana is French, with the Italians second and the Greeks and Slavonians about equal for third place. In New Orleans, Italians predominate in the population, with Russian and Polish Jews second, French third, and Americans—by blood and parentage—fourth. The majority of these foreign-bloods are naturalized, but they have made of New Orleans a highly cosmopolitan city, holding down its municipal advancement and obedience to law to the standards they and their parents imbibed in the hives of population in Europe.

The obstacles set before the enforcement agents in the country of Louisiana have been nothing as compared to those put before them in New Orleans, and it is only within the past two months that they have been able to obtain the co-operation of the police department in making arrests and investigations of the manufacture and sale of liquor. One unique feature of the work of these agents is that practically no Negroes have been taken up, either for the manufacture, or for the sale of liquor. The Negroes who comprise approximately 40 per cent of the population of New Orleans, seem to have accepted prohibition as a fact, and to be making few efforts to violate the law.

Something New in Education

Concluded from page 11

theoretical training is measured have started at the bottom and worked up through the maze of actual and practical experience. Antioch will turn them loose prepared to start at the top and work ahead. There is much to be saved to industrial and commercial concerns in small industries, such as labor, shop organization, accounting, labor management, buying, selling, and so on. The virile man today tends to shun a purely academic education. He abhors it because he has seen other fellows with brains start all over again when they leave college. He doesn't want to start at the bottom after a four-year course. He has a right to start in on graduation day with a proprietorship that will be conspicuous and commanding in its usefulness. Antioch hopes to make the men step into business with as much unconcern as if they were walking from one classroom to another. Now that is something new in the matter of education in America, as you will agree. It utterly shatters the traditions of the past. It is an advanced step. It is hoped to make possible through development there a standard grade of pocket handkerchiefs and factory lunches and women will have a share in this part of the curriculum. Antioch has turned its face from the idea that education consists in absorbing knowledge.

President Morgan says: "We are searching the country over for a little group of men who have a clearly defined philosophy of another sort—that education consists in seeing principles, in getting the significance of life, in developing all the powers of men and women."

Antioch will preserve the spirit of scholarship and in asking students to come for cultural education and industrial training when the college reopens under the new idea next September, it will not be doing so without a very substantial reward to offer.

Antioch will develop, as Mr. Morgan says, a spirit of responsible citizenship. The courses are aimed to prepare students for environments where certain types of social service are peculiarly needed.

In the past young men fired with zeal and enthusiasm to amount to something in this world have had chiefly the one course to follow—starting at the bottom. This has been a good way to arrive at the top, but Antioch thinks she is going to offer a better, more modern way. She is going to say to her students—we are going to equip you in every way for starting at the top and "going over." The country, industrially, culturally, socially and in every other wise needs above all things at this time a practical way of sending its best young men and women "over the top."

This is something new in education. It is a departure which may be called an experiment, but it will demonstrate, its board of trustees believe, that it is possible to equip youth for doing original things in a most successful manner.

The Community Drying Plant Is Successful

THE first community drying plant for fruits and vegetables was operated in Nebraska in the summer of 1917. It was established as a war-time method for the greater conservation of food products that usually go to waste, particularly fruit and vegetables. Because of the success of the community drier, its simple operation, and the favor with which the dried products were received by the housewives who tried them, the drying plants multiplied rapidly.

The work of the drying plant is pronounced a success.

The principle of the drying plant consists in removing the air rapidly from a cabinet filled with sliced fruit or vegetables distributed thinly on shallow trays of screen. Dry air takes the place of the saturated air as fast as it is removed from the cabinet and thus there is a continuous circulation. This process is kept up until the necessary amount of moisture has been removed from the products, the air being changed at the rate of about seventy-five times a minute, or in proportion to the size of the fan used to withdraw it. The cabinet can be made at home with a few simple tools, and also the trays, but an exhaust fan of some kind, preferably one operated by electricity, should be bought. The drying principle may be used by the individual family or by communities.

As far as is known the plant established in Nebraska in 1917, in the Belmont community, was the first in the United States. It was installed under the direction of the extension service of the University of Nebraska, according to the drying principle just described which was first worked out in the laboratories of the United States Department of Agriculture. More than sixty families in the Belmont community patronized this first plant and organized a community club to operate it. The community was one of small homes where garden growing was carried on to considerable extent and thus was ideal for the successful operation of a drier of this kind. One of the first requisites for the success of a community drier is sufficient products to keep it going. The plant built at that time cost about $300, including all the equipment, such as the electric motor and fan. The cost would be greater today for such equipment. This plant was a 120-tray size. A smaller plant or one of the family size could be built for much less. If operated in the country a gasoline engine could furnish the motive power for the fan.

The drying cabinet is simple and easy to make and can be installed in a schoolhouse or in any other convenient building in which it will be protected from the weather. The one in the Belmont community was placed in the church the first year, and while the pastor spread the gospel of religion to his Sunday audience, the drying plant at one side of the room was religiously removing from the fresh vegetables their moisture content. Sucking the air from the cabinet instead of forcing it through has proved to hasten the drying considerably. The time required for drying depends, of course, upon the product, the condition of the atmosphere and the size of the fan. The exhaust pipe from the fan leads directly to the outside of the building. Good ventilation should be available.

Before being placed on the drying trays the products are sliced in small and thin pieces either by hand or with slicing machines. The smaller the pieces the more rapidly will the drying proceed. The drying process greatly reduces the volume of the garden products and changes their appearance until one would hardly recognize them. They appear much like withered weeds chopped in small bits and when tasted do not always resemble the flavor of the fresh product, but usually have a much more appetizing flavor. This shrinkage of the products is a decided advantage in storing. Care must be taken to see that all moisture is removed before storing. The dried products pass through a "sweat," like wheat in the stack, and they must be stirred frequently or stored in very small quantities until this stage is passed. Almost every variety of fruit or vegetables can be dried successfully in these driers. The following products were handled by the Belmont community plant: Peas, beans, asparagus, potatoes, parsley, spinach, carrots, green onions, squash, pumpkins, egg plant, turnips, sage, greens, cabbage, peppers, corn, tomatoes, celery, kohl-rabi, Swiss chard, yams, small berries, cherries, apples, elderberries, apricots, peaches, currants and gooseberries.

Thorough cleaning as for table use should be given the fruits or vegetables before they are sliced for the drier and only sound products should be used. Some of the products require blanching before being placed in the drier. This may be done by plunging the products after they are sliced into boiling water for one to ten minutes. Sanitary methods of handling should be followed at all times and care taken to keep out insect enemies.

Rebuilding World's Most Remarkable Temple

IN JAVA, East Indies, work is just being finished on the restoration of the most remarkable temple in the world, covering almost the same area as the Great Pyramid of Gizah. Without the aid of mortar or cement, column, pillar, or arch, the ancients erected terrace after terrace of this temple out of stone. Hundreds of life-sized statues and miles of bas-relief constitute the wonderful ornamentation.

For centuries this temple slumbered peacefully under the earth. The Netherland Government, to whom the island belongs, recently made an appropriation for its excavation. The result was amazing and archeologists say it is one of the surviving wonders of the world. As an initiation of the temple into the light of the twentieth century, an intrepid American engineer, Fritz Sluymers, recently climbed to the top of the temple on a motor cycle, a feat sufficient to cause even Buddha to open his eyes in wonder.

Below is a close-up of one of the balconies of the temple showing the many curiously interesting antique carvings with which the temple abounds.

Old Lundy—A Kingdom Within a Kingdom

"Old Lundy lay some leagues away,
Guarding the middle sea;
A silver mist his low length kissed,
Yet rugged and cold looked he."

A TINY island kingdom, within an island kingdom, rears its shaggy outline from the sea some dozen miles off Hartland Point in Western England, where the Severn estuary indents the rugged coastline. The tiny kingdom is Lundy Island, part of the British Empire, which was purchased late in 1917 by Augustus Langfiham Christie, a brother-in-law of the Earl of Portsmouth, and the owner of extensive properties in North Devon.

Lundy is just about to receive its first automobile. Its contour is not suited to vehicular travel. But its caretaker grew old, and a special car has been built, with gears adapted to the brief mile or so of semi-precipice it will have to negotiate. Also it will carry the infrequent visitors to the famous rock-head whence may be seen one of the wildest seascapes of all that famous rock-spitted coast.

Once the rendezvous of pirates and smugglers and, still earlier, the home of the Marisco family, whose activity forms an important chapter in English history, the island still preserves a measure of independence which can be likened only to that of the feudal barons, and makes it one of the world's most extraordinary landmarks.

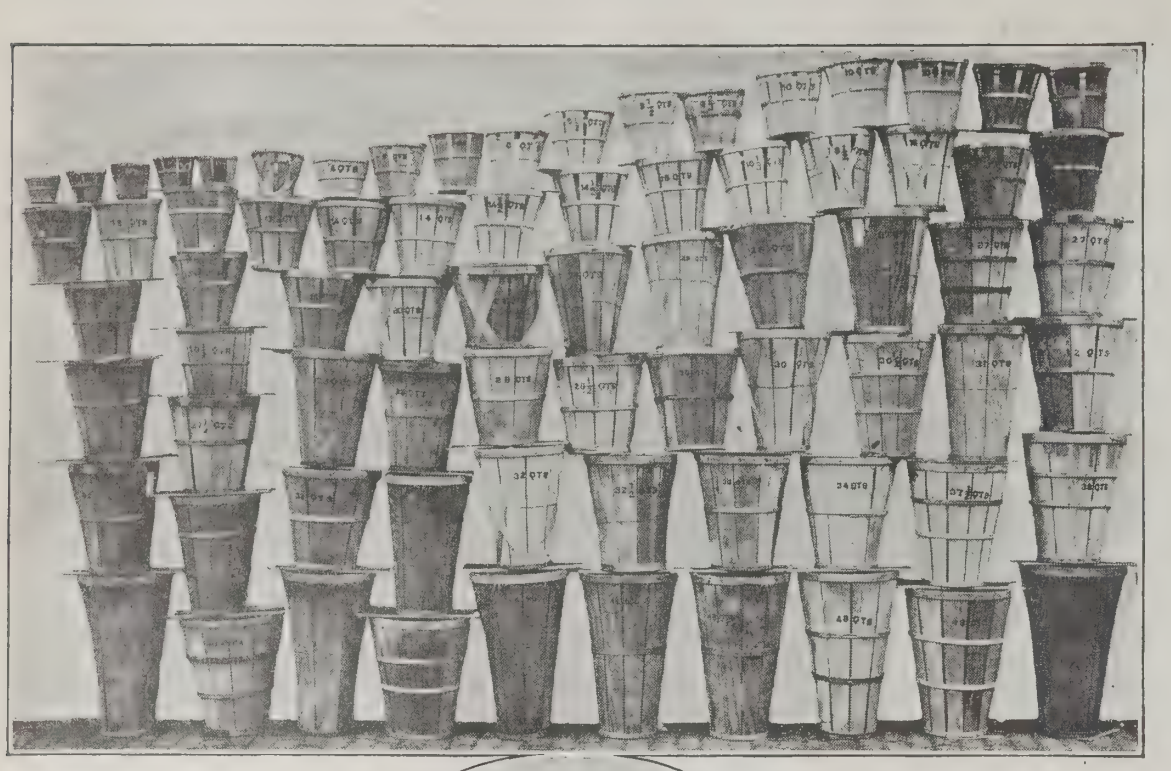
It is literally a barrier of granite, lying athwart the crowded fairway of the Severn estuary, often shrouded in impenetrable fog, its western cliffs exposed to the full fury of the Atlantic breakers—a siren's rock that has lured many a good ship to its doom.

In shape Lundy is not unlike the leaf of the dandelion. It is about three miles long and a bare mile in breadth at the south shore, tapering to a point at the northern end, and either side of its coastline is very irregular and indented with numerous coves. The plateau is divided by the quarter, the halfway and the three-quarter walls into four unequal parts; of these only the southern portion is under any sort of cultivation; the remainder, beyond the quarter wall, is all sheep and cattle runs.

On the east coast there are some abandoned granite quarries; the difficulties of trans-shipment were so great that it did not pay to work them, though some of the stone is of so close and fine a grain that it was used for the facing of the Thames embankment.

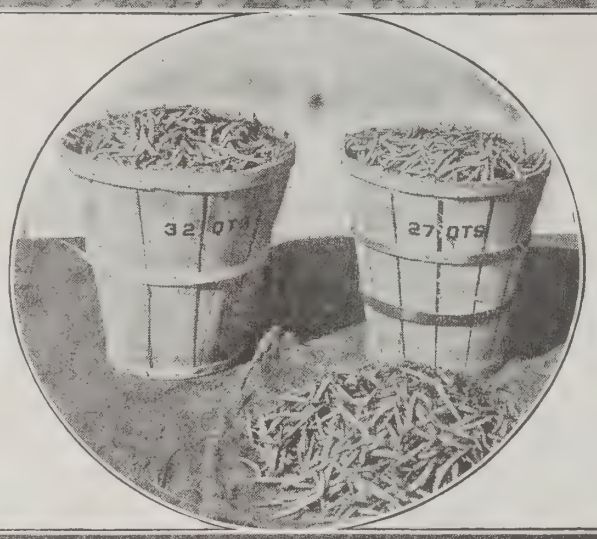
The grandest scenery is on the west coast, which is a long succession of rocky promontories, at whose feet, in a westerly breeze, the long Atlantic rollers thunder as they break in clouds of spray. Here is the smooth slope of the Devil's Slide, with its fall of some 400 feet to a pool of deep, green water, inclosed in rock, and here is the largest brook on the island. Issuing from a rushy pond at the head of a valley of rocks, it falls from ledge to ledge in tiny cascades of foam until it pours down a precipice almost at the foot of a tall pillar of granite called the Devil's Chimney. Off the next headland the sharp outline of Needle Rock rises against a background of blue sky and green and white sea.

The only landing-place is a small bay with a shingle beach on the southeast side of the island. The cliffs here are of slate, crossed in places by narrow veins of greenstone. At high tide they shelve precipitously to the very water's edge. On your left, as you enter the bay, the tide swirls swiftly around the black rocks at the base of the green-topped South Point; then comes a dip, above which, rising to a height of 300 feet, is the steep cliff of Lametry, with the lighthouse; a sharp ridge of slate joins this to the sheer crag faced with greenstone. From the summit, 400 feet above the sea level, the dark, square battlements of Marisco Castle frown on the landing-place at its foot.



Past headlands carpeted with lichens and sea pinks, with a patch of gray here and there where the rock protrudes, you come to the tall cone of the Shutter, at the southwest corner of the island. A narrow ridge of rock, 100 feet above the level of the shoreless bay, joins the Shutter to the cliff, in whose face, about 50 feet below the summit of the plateau, yawns a smooth abyss, in shape like an inverted wedge, known as the Devil's Limekiln. The bottom is strewn with huge boulders, which are sucked backward and forward by the surge that rushes moaning through a narrow cavern.

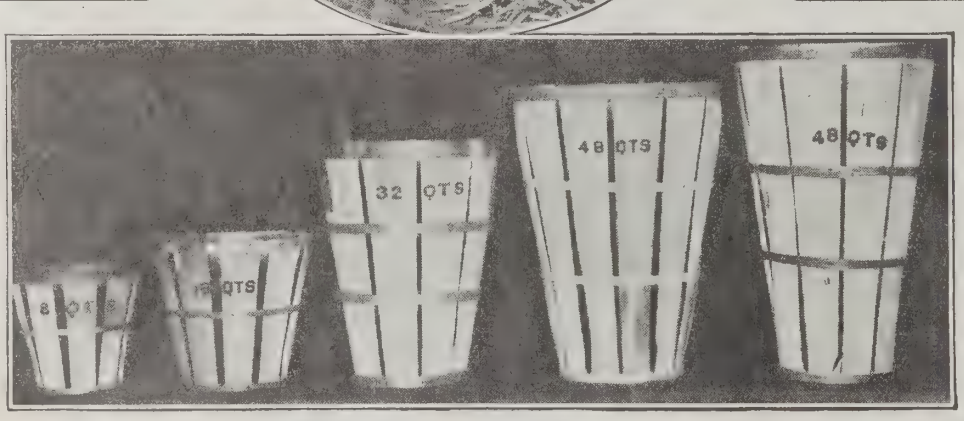
There is a local tradition—referred to by Kingsley—that the Shutter once exactly filled the pit, until the devil, perceiving the possibilities for mischief then wasted, plucked it out and set it up in the sea. A swift race pours across a sunken reef between the Shutter and the Black Rock, a low, treacherous crag about 150 yards from the shore. This rock, and not the Shutter, is Kingsley's "huge black fang rising amid a column of salt smoke" on the seaward side of the tide race, and if in place of "Shutter" we understand "Black Rock," the mystery—which has puzzled many—how the armada galleon (in "Westward Ho!") could go ashore between the Shutter and the land is explained.



Twice the island has been in the hands of foreigners—once when it was captured by a band of Turkish pirates, who threatened to burn the town of Ilfracombe; and, secondly, in the time of William III, by French privateers, who gained possession by landing a coffin filled with arms and ammunition, on pretense that it contained the body of their captain, whom they were anxious to bury in consecrated ground.

Lundy, in 1836, was purchased by the late Mr. Heaven's father, a West Indian planter, who attributed his comparative poverty to the emancipation act and free trade in sugar. Father and son in succession ruled the island as benevolent autocrats until a year or two ago, when the son died, rich in years and honor. As far as money, good intentions and energy could go, he had made Lundy, in a popular punning phrase, the "kingdom of Heaven," and recent reports indicate the tradition is being upheld.

Queer Tricks of the Trade



Above — Here are shown seventy-five sizes and styles of hampers for fruits and vegetables. Use of these has become confusing to both buyers and sellers and it is proposed to standardize sizes, that cheating may be done away with. Note the variation in shape of many hampers of the same capacity.

Center—The pile of beans on the burlap is the overflow obtained by pouring the beans from the bushel hamper into the twenty-seven quart hamper.

Below—These five sizes of hampers will take care of all needs. Their adoption will do away with much confusion. The one and one-half bushel hamper is made in two sizes.

IT IS amazing how many slick schemes have been evolved by producers, wholesalers and retailers in all kinds of fruits and vegetables, to make more than their just share of profits by skinning each other and the public.

The next time you visit a market note the various and sundry types of baskets, boxes, crates and containers in which fruits and vegetables are offered for sale. They differ so much in a variety of ways that no man or woman can tell with any degree of exactness what quantity they are getting.

A favorite trick of the trade is for city wholesalers to buy a given number of baskets of some particular commodity from a distant producer and, upon its arrival at their warehouse, repack them into baskets exactly similar in appearance, but which, in reality, hold several quarts less. Through this ingenious and thrifty —always thrifty—process, the wholesaler has no difficulty whatever in making a hundred baskets of something where there were only 75 formerly. Such well-known magicians as Kellar, Houdini and Thurston never had anything on these chaps. Upon the theory that all is grist that comes to their mill, these wholesalers then proceed to sell those hundred baskets of stuff based on the price of 75. In other words they reap a neat profit on each of the 75, and what they get for the additional 25 is pure velvet. But the consumer thinks he is getting the original quantity sold to the wholesaler by the producer; the producer never dreams but what the wholesaler sold to the consumer the same sized package he sold to him, and which he labored a year from sunup to sundown to produce.

Great game, isn't it?

But very, very often, that prolific aggregation of hard workers, known to town and city dwellers as hucksters, make these same wholesalers look like inexperienced pikers and amateurs in putting grist through their financial mills. It is no trick at all for an energetic, hustling and conscienceless huckster, for instance, to take a six-basket Georgia peach carrier holding six four-quart baskets, and take a smaller carrier of almost the same size, but instead of six four-quart baskets, he uses six three-quart baskets, dumping the peaches from the four-quart baskets into the smaller containers, and using the surplus in making up an additional crate. What they do with peaches, of course, is duplicated with many other commodities.

There are in some sections of the country a tribe of producers and wholesalers that doesn't seem to be able to break itself of the old dishonest habit of packing the runty, gnarly or wormy fruit or vegetables in the middle of the receptacles, assuming that such deception will pass undetected. They fool no one. Such people make enemies for themselves wherever their product is marketed. This sort of cheap trickery, however, is rapidly being overcome and a majority of the producers and dealers are grading their products and disposing of them along lines of fair standardization.

The purchasing of certain fruits and vegetables, particularly pears and tomatoes, in small baskets is a risky transaction. It is surprising how differently the same sized pears or tomatoes can be placed in baskets of one size. It is all in the trick of packing.

Secretary Meredith, of the United States Department of Agriculture, fully appreciates the unfortunate situation as to the present condition of marketing farm products, and is carefully co-operating with his corps of experts in the Bureau of Markets in an effort to rectify these conditions. These men, as a result of long and careful consideration to the subject, have worked out a definite and practical plan of simplifying and standardizing the types of baskets and containers for general use throughout the country. There is not the least doubt as to the success of the plan, and the general satisfaction that is bound to ensue if their recommendations shall be put into effect everywhere. But this can only be done through the passage of necessary laws by Congress. Whether Congress will deem the matter of sufficient importance to give it the necessary attention, of course, remains to be seen.

The Wood Hollow Papers

By ROBERT PAGE LINCOLN

IT IS strange yet nevertheless a fact that children are taught from youth to believe that the owl and the hawk are dire enemies of mankind and therefore must be killed whenever the opportunity presents. That *all* hawks and owls are destructive is a ruinous theory, for such is certainly not the case, but that *some* hawks and *some* owls are destructive, even to a degree, is very true. It remains to be learned which are the valuable ones; and to discover this demands a system of study. It has been the common belief that the more hawks and owls killed the safer people would be—and it is strange how far the matter has been carried to find out. One would think that this conviction is reserved to individuals but in the state of Pennsylvania the state legislature at one time enacted a law outlawing all the hawks and the owls of the state, granting a bounty of fifty cents a head for all brought in. The slaughter went on apace and in two years nearly 200,000 scalps were harvested and nearly $100,000 was paid out in bounties. No doubt men made a business of this killing. The stage was soon to be set for the rise of the curtain in Pennsylvania. People were now to be given a concrete example of the law of balance and proportion, that you cannot tamper with nature's means of counteracting a menace without painful results. The curtain rose. At the close of two years the farmers discovered that the fields, groves and farms were infested by swarms of mice, rats and insects. Never had such a scourge come upon them. The most beneficial owl of all (that lives almost wholly around the barns and kills more barn rats than any other living creature, the barn owl) had also been killed off and the rats under the barns increased one hundred per cent, making it necessary for men to go from farm to farm with ferrets to drive out the rats and kill them in this manner. In the fields the propagation of mice went on rapidly. No hawk by day coursed low to seize them: no owl by night swooped down out of the nowhere to make pellets of them.

The truth had been driven home to the people. In frantic haste plea after plea went up to the lawmakers and finally the law was repealed. The great harm had been done and it took years of protection of these two species to bring things back to normal. In speaking of the "fool hawk and owl law of Pennsylvania" (now a standard joke) a naturalist has stated with genuine wisdom:

"The moral of this episode is that it is very dangerous to meddle with the balance of nature by a wholesale destruction of hawks and owls. There are a very few species that deserve to be destroyed, but those are now so difficult to find and identify at gunshot distance that only an intelligent hunter is competent to undertake their destruction and guarantee no killings by mistake. Today the really destructive are almost a negligible factor in wild life economy and only bird men should be encouraged to go hunting for the objectionable hawks and owls. There is no longer any real necessity to provide bounties for the destruction of the few and now rare species of hawks that do more harm than good and that deserve destruction when they are numerous."

Telling hawks and owls, one variety from another, is really difficult for the simple reason that they are hard to approach, and this is true with the bird student as well as the average person. Generally the hawks killed are not the harmful hawks and in this manner valuable ones are destroyed while the destructive ones get away, skin, feathers, beak and all. A hawk is a hawk to the average person. Hawks that rarely touch poultry are always to be found around the meadows and the pastures swooping low, here and there, not frightened, probably because they have nothing to trouble their various consciences. It is thus that the farmer boy often kills the valuable ones because they are easy to get at. By a misapplication of names the red-shouldered hawk is indiscriminately designated as a "hen-hawk" while the red-tailed hawk is called a "chicken-hawk" and *vice versa*. Hence they are unjustly slain. The truth of the matter is that both these varieties, the red-shouldered hawk, *Buteo lineatus*, and the red-tailed hawk, *Buteo borealis*, are invaluable aids in the upkeep of the land. They are the deadly enemies of mice and rats and investigation has proved that little poultry is consumed by either of these well-known members of the species.

The red-shouldered hawk is very common and is from 18 to 20 inches in length, reddish-brown, with a blackish tail barred with white. This latter point is a means to identification, also the fact that it is seen flying very low to ground and fields in lookout for mice. They patiently go back and forth over a scant meadow-plot, leaving apparently no foot of it slip by uninvestigated, and flying so slowly at times that one marvels they can hold their balance. At times they are so near to ground that their wings brush the grasses. I have stood and marveled as I have watched one of these hawks at work. I have left only to turn back and again take up my post, unable to draw myself away. As they swoop low over the face of the meadow they fan vigorously with their wings to work up speed, and then, by means of this sustained energy, they glide; when the momentum has spent itself they work the wings rapidly again and then once more glide. Arrived at the end of the plot they suddenly veer and return in the direction from hence they have come, though off to the side of the path they have hunted over. Thus no foot of ground is left unhunted.

(*Continued next week*)

Many Men of Many Minds

Rear Admiral William S. Sims.—The world will not stand for another great war. Even were the world disposed, it could not stand another great war. The nations must find a way to compose their differences. The only sure basis is a spiritual one; it is through the power of sentiment.

Viscount Kato.—Japan may be well advised to leave the affairs of foreign nations to the foreigners, unless her own interests are seriously menaced. Siberia may yet be far from political agreement internally and the maintenance there of a Japanese army is fraught with every danger.

Bainbridge Colby.—It is natural that the nations of South America should appreciate their power, wealth and importance, which every other nation so freely concedes. They are a delightful people, progressive, educated, enlightened, and their attitude toward this country is one of unmistakable friendliness and appreciation, and they ought to be appreciated, and deserve to be.

Samuel V. Hoglund.—The Mennonites are not a freakish people, setting themselves apart from the other people of the world by mannerisms in dress, modes of living or speech. They are simply followers of a religion which teaches them industry, frugality and peace.

Albert S. Burleson.—I believe that I have more enemies and have been more generally denounced than any member of the cabinet. It has not, however, robbed me of my serenity of mind, nor spoiled either my disposition or my appetite. I know who my enemies are, how I made them, and why, and the reasons are satisfactory ones to me.

Viscount Yasuya Uchida.—It is the tragic destiny of a comparatively small but self-reliant nation like Japan to be obliged to watch anxiously the dispositions and measures of nations more fortunately circumstanced and with greater resources at their command. She cannot, however greatly she desires it, inaugurate experiments in disarmament in advance of other nations.

Vilhjalmur Stefansson.—There are prairie lands in the regions north of the Arctic Circle where grass very similar to the famed "blue grass" of Kentucky grows in abundance. It makes fine grazing pastures for the reindeer. The temperature in this region has been as high as 103 degrees in the shade, which will rival even the heat of the tropics.

Dr. Alberto P. Severgnini.—In this country you believe that a gun on the hip leads to crime, while in South America we believe that gun-toting prevents crime. We all carry guns and Buenos Aires has fewer crimes than Chicago, New York and other large United States cities.

Philip Gibbs.—Because I love France and the spirit of France I cannot shut my eyes to dangerous possibilities in her European policy, which in my judgment may lead to a new grouping and arming of nations for war, which then, indeed, would complete the ruin of France and drag us all into black gulfs from which Europe would not escape with many traces of her ancient civilization.

General Leonard Wood.—There are few instances where profiteers have carried on with more hardihood and reckless disregard of public opinion than in the United States during the World War and since the armistice.

Alvaro Obregon.—Revolutions are merely processes of evolution toward progress.

Professor E. C. Wilm.—Dancing serves as a useful social end. It gives married people the opportunity to associate with persons of the opposite sex under conventional circumstances, and it helps uphold conventional society.

James L. Garvin.—It was a World War. It must be a world peace. To suppose that the victorious nations could enjoy real peace and its benefits as they desire, while over 200,000,000 of Germans, Russians and sundry are not brought fully in to restore a normal productive and trading system in the world—that was a grotesque and suicidal delusion.

H. G. Wells.—A time will come when a politician who has wilfully made war will be as sure of the dock and much surer of the noose than a private homicide. It is not reasonable that those who gamble with men's lives should not stake their own. The service of the world-state calls for much more than passive resistance to belligerent authorities, for much more than exemplary martyrdoms.

Charles W. Eliot.—There is an extraordinary amount of credulity in the American people in flying rumors and news. It is a new development highly unpromising. We are more and more becoming subject to what I may call "herd impulses," gregarious impulses, common emotions.

A. B. Farquhar.—My sixty-five years in business have carried me through nearly every crisis of the country. I have never seen a period when America, in the opinion of competent observers, was not going to the dogs—or when it was not actually growing bigger and better.

Philip Snowden.—There surely can be but one ideal that every humane person will try to realize in 1921, and that is to bring perfect peace to a sorely stricken world and to restore the economic ravages of war, and to set the ruined countries on the road to economic and industrial prosperity.

George T. Odell.—In the matter of foreign-trade development the United States stands today upon the threshold where Germany stood a quarter of a century ago. Thanks to the war a merchant fleet has been created in an unprecedented short space of time, while that which it took Germany twenty-five years to build has either been shattered or dispersed among the victors of the war, leaving England and Japan as our principal rivals in this field.

Francesco Nitti.—It is one thing to formulate principles, but quite another to apply them. It is easy enough to divide territories on the map, but a very difficult thing to overcome the resistance of a people.

Agriculture—Manufacture—Transportation

A recent test to determine how long seeds remain alive showed interesting results. Seed corn gathered in 1908 and germinated in 1920 was very low in vitality, the grains producing very weak sprouts as compared with one-year-old corn. Tests also prove that seeds have low vitality when gathered during years of excessive humidity and rainfall. Oats and wheat seeds gathered in 1915 show extremely low vitality.

Dr. Yen Te-Ching, managing director of the Canton-Hankow Railway is visiting the United States for the purpose of inspecting railroad facilities and lake transportation of freight.

Business reviews are urging merchants to put price tags on their goods. "How much?" is the first question the public asks, say students of trade conditions.

The United States Department of Agriculture experts say that American rice is as good as that grown anywhere in the world. This year's crop is about a fourth larger than ever before.

In statements issued to the press the publicity department of the National Coal Association declares that bituminous mine operators make only 25 to 30 cents a ton on their product and the reason coal which sells at the mine mouth for $3.47 costs the consumer many times that amount is due to freight rates and labor.

Finland is finding a profitable market in Europe for dairy machinery and is building up a heavy trade. The loss of the Russian and German markets was a severe blow but the Finnish business men have found a sale for their products in England, the Baltic provinces and South America.

The crops destroyed by small rodents and insects in America would feed the people of Belgium. The great natural enemies of these pests of the farmer, fruit grower and forester are the birds.

Ten years ago California raised no rice. Last year's crop amounted to 150,000 tons on soil formerly thought worthless.

Motor travel on highly improved highways paralleling its line has so seriously affected the passenger traffic of the Chesapeake and Western Railway Company in Virginia that the railroad has petitioned the state corporation commission for permission to abandon passenger service on the road.

It is suggested by a commercial attaché of the Bureau of Foreign and Domestic Commerce that American manufacturers and exporters addressing American representatives abroad, attach to their letters a brief statement as to their capital stock, credit rating, and resources for transacting business.

The 1920 output of long-staple cotton in Arizona and Southern California alone was 100,000 bales.

The vice consul at Panama reports that improvements completed at the Cristobal coaling plant make it the largest in the world for bunkering ships. There are five berths and the largest ship afloat may be coaled at the rate of 1,200 tons an hour.

The bicycle is becoming quite common in Egypt. Almost 2,000 were imported in 1920.

Farm land in the state of Washington has increased sixty per cent in value since the 1910 census.

A prominent western road with the slogan, "The Gospel of a Good Load," has launched a campaign to promote heavier car loading and the conservation of equipment. The results thus far have been very gratifying.

It is reported that British oil interests, including the Royal Dutch syndicate, have received concessions in newly discovered oil fields in northern Greece.

The American Locomotive Company plans to build a plant at St. Louis to cost about $25,000,000. It is believed the new plant is to be built in anticipation of a big demand for motive power in the coming years.

The shortage of both fuel oil and coal in certain parts of Canada is hampering railroad operation to a certain extent. The question of the electrification of railways is under discussion and the Canadian Pacific Railway Company has taken steps to electrify its lines in British Columbia.

A New York state authority on potato growing states that the small potatoes are better for seed than the larger ones.

When Russia brings her corn producing lands up to the standard of America's corn lands she alone will be able to supply the world's cereal needs with the exception of maize and rice.

According to the Federal Trade Commission the outstanding development in the marketing of grain recently has been the entry of the farmer into the elevator business. Many farmers have co-operative elevators which they use in marketing their grain.

In the last ten years wages of men hired on farms have more than doubled. In the last twenty years they have more than tripled and last year they were more than four times higher than in 1879.

A bill directing the Secretary of the Treasury to honor certificates of the Interstate Commerce Commission for partial payments to the railroads on account of their six months' guaranty has been favorably reported to the Senate by action of the Senate Committee on Interstate Commerce.

To raise revenues to meet the increasing needs of state government, the governor of Pennsylvania recommends a tax of four cents a ton on bituminous coal produced at the mines and eight cents a ton on anthracite.

A new shock absorber for refrigerator cars reduces egg breakage in shipment. The device is by no means limited to the transportation of eggs but is adaptable to use for other merchandise and food products which are subject to breakage by jarring of car.

UNIV OF ILL LIBRARY
URBANA ILL

Briefly Told

There are 12,000,000 Negroes in the United States. They constitute one-seventh of the working force of the country.

Lenin has submitted to the Eighth Congress of Soviets a plan for the complete electrification of Russia in ten years.

There are 311,000 applications for passports to the United States at present on file in Poland according to the Commissioner of Immigration for the port of New York.

The glow worm is not a worm at all. It is a beetle, the female of which never gets beyond the larva-like form. Her mate is a hard-shelled little beetle not as luminous as she is.

Hardware men are reaping a harvest due to the crime wave. Padlocks, heavy chains and burglar devices are being sold in larger quantities than they ever have been sold before.

America is furnishing to France wooden houses. They are ready-cut, consisting of three rooms and a shed and occupying about 23 square feet.

Camphor is now being made from turpentine by a synthetic process.

Connecticut is establishing an improved salmon hatchery at Madison for restocking eastern streams with this valuable fish.

Cocoanuts are a native of Florida but originally came from a boat wrecked on the coast years ago.

The chief of the morale branch general staff, whose business during the war was to study soldier psychology, states that the slogan, "Let's go," is the slogan that won the war.

Applications for marriage licenses in Nebraska must rest in the office of the county judge fifteen days before being granted and guardians or parents must be notified by registered letter according to the terms of a bill submitted in the state senate.

Millionaire clubmen acted as stokers on a Swedish liner bound for New York when the regular crew of firemen struck for higher wages.

Shells filled with a gallon of oil and fired at angry waves will calm a turbulent sea according to tests made by United States life guards of Cohasset, Massachusetts. It is said that a barrage of such shells to the windward of a wrecked vessel would produce a sea sufficiently smooth to enable a lifeboat to make a safe approach.

A Roman battle standard and a Roman general's folding camp chair, antiquities dug up in Essex a century ago, two of Great Britain's most ancient military trophies, were recently sold at a London auction room for two hundred pounds.

In the year 1920 Great Britain reduced her national debt by £247,000,000.

A shell from one of Admiral Dewey's guns, after lying for twenty-two years in a vacant lot in Manila, exploded when a lad picked it up and hurled it against a rock. The concussion knocked three boys to the ground and painfully injured them.

Shredded cedar bark used in hens' nests, keeps insects out of them, as the bugs strongly object to the spicy cedar.

A boy six years of age was recently shipped by express from Ranger, Texas, to Bend, Oregon. A tag on his coat bore the following information: "Leonard Adcock, Ranger, Texas, destination, Edwin Berly, Bend, Oregon."

A circular saw mounted on a carriage and operated by electric power makes it possible to bring it to work in any conceivable position. It is said the consumption of current is extremely moderate.

Resigning from the vice presidency of a bank to become an oil driller a Texas man will don overalls to learn the driller's game "from the surface down."

Births are outnumbering deaths in France for the first time in years. This is the most encouraging symptom of the country's recovery from the war's ravages.

Contrary to general belief the American Indian is increasing slowly in numbers according to the Indian commissioner.

Oxford University is organizing an expedition to Spitzenbergen to make discoveries of a geographical nature on several of the highest peaks which have never been scaled.

Japan leads the world in proportion of divorces to marriages.

Salt is obtained in Ecuador by permitting sea water to enter wide pits. The mouth of the pit is then closed and the water is slowly evaporated by the sun, precipitating crystals which are broken into pieces for distribution.

The Chinese and Japanese in their fables regard the milky way as a stream containing silvery fishes. African Bushmen and American Indians associate it with lights guiding the paths of wandering spirits.

The cost of one battleship would save the lives of three and a half million starving children in the war-devastated areas of Europe.

Germany is using animal muscular fiber in the manufacture of a new artificial silk. The cementing material is dissolved and the separated fiber straightened. These are woven and if desired the fabric may be rendered waterproof by impregnation with rubber.

There is more lumber consumed in forest fires in America every year than all America's sawmills manufacture in a year.

Calcimine or whitewash on wood proves to be resistant to fire to a certain extent. While it does not prevent burning at high temperature, it lessens the risk of fire from cigarets, sparks and matches and is cheap and practical.

In India lizards are hunted for their skins. The skins when tanned are made into women's and children's shoes, purses and handbags, and are exported.

Electrical installations in the United States have doubled every five years during the last generation.

It has been said that an osteopath in Washington, D. C., cured a prominent Australian lecturer and literary man of blindness in a series of treatments lasting three days.

The annual tobacco bill of the United States is $2,110,000,000 of which $800,000,000 is spent for cigarets.

Piling coated with a mixture of three parts sand to one part cement forms a covering completely impervious to water and keeps out the teredo, limnoria and other wood borers which have been a problem for years where piling has been subjected to salt water.

Putting bank robbery on a par with murder the Arkansas senate recently passed without a dissenting vote a bill providing capital punishment for criminals of this class. This form of robbery is on a par with murder in that it gives juries the right to fix either life imprisonment or electrocution as punishment.

Explosives deteriorate with time and chemical decomposition takes place if they are not kept at a safe and constant temperature. The French minister of war suggests that France sink her explosives in waterproof tanks in the Pyrenees lakes and thus keep them for decades.

English walnuts selling at $3 each in Denver were found to contain small capsules of morphine and cocaine in place of nut meats.

A bill making it unlawful for any person to offer for sale any dirk, Bowie knife, metallic or false knuckles, sling shot, or any other dangerous weapon has been introduced in the West Virginia house of delegates. The bill also provides that no firearms are to be sold to any person of foreign birth who has not been naturalized.

Wireless apparatus is used to hunt criminals. The New York police notify police of other cities within a radius of about 300 miles concerning the movement of suspects.

Expressing reluctance to make food out of so valuable a bird while we are preaching simplicity and thrift, President-elect Harding has written a Rochelle woman declining with thanks her offer of "the flame of bronze" champion turkey at the recent national poultry show for his first Thanksgiving dinner in the White House.

Why the Team Goes South

A story of preparation and training necessary to condition major league ball players for a season.

Our Quadrennial Show

An interesting collection of facts having to do with the inauguration of many of our Presidents.

The Farmstead—Its Possibilities

This is the first of an important series of articles, appropriately and interestingly illustrated, dealing with problems of the farm; they have to do with the social and economic life on the farm and we consider them to be an important contribution to a subject greatly under discussion.

The Center of Jewish Rule in America

Power of Our Inner Government

The first detailed story of the activities of the Kehillah, the great Jewish society where radical and conservative, employer and employe meet —as Jews—to work for Judah! Its ramifications in New York, and its workings in the politics of both city and state form probably one of the most vital of the many links in the study of *The International Jew.*

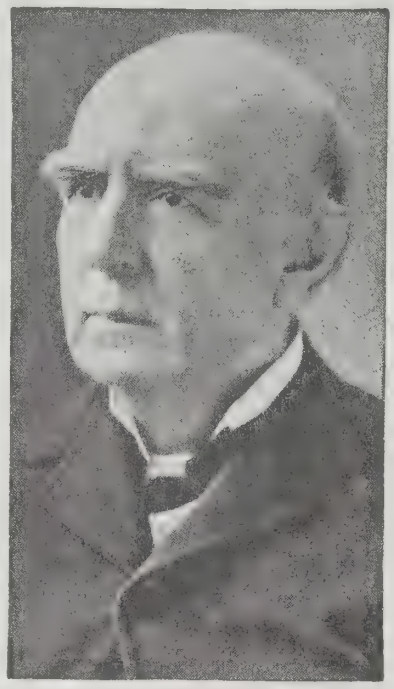
Our Most Popular National Park

There are nineteen beautiful national parks, including those in Alaska and Hawaii, but none has grown in public favor so rapidly as has Rocky Mountain. Situated within easy traveling distance of Denver and accessible to motorists, its picturesqueness is drawing thousands.

He Capitalizes Hate

You no doubt have been one of thousands who have thrilled with horror at Eric von Stroheim.

Lincoln and Harding



The table that links the two men in the ceremony of taking office will be a feature March 4.

The Table That Will Link Harding's Inauguration With Lincoln's

By AARON HARDY ULM

IT IS a little and daintily designed piece of parlor furniture, of solid mahogany. It is one of the kinds of home interior fittings that relieved the drab of the horsehair upholstering days of the Civil War period and later. It has done duty in the home of a prominent Washington family for more than fifty years, with an additional pleasing service to every beginner-President since Abraham Lincoln, excepting one. And it will again come forth to rest the inaugural arm and hand of President Harding, to uphold the Bible that will seal the Presidential oath and support the address that will announce national policies for the next four years. It began to do those things for the Great Emancipator and if good luck continues, the table will render like services for many future Presidents.

The article of furniture isn't public property and as far as known it has always been privately owned. Its continued existence in a state of excellent preservation is due to the thoughtfulness of a young architect who made the arrangements for Lincoln's inauguration in 1861. The architect was Edward Clark, who for a half century was attached to the National Capitol construction force, being, as chief architect, in charge of the Capitol building and all improvements thereon, for nearly forty years. The "inaugural table" is now owned by Watson F. Clark, a Washington business man and son of Edward Clark, who, in line with the custom of his family for a half century, has tendered the table to the Harding inaugural committee, which, like many of its predecessors, has accepted it for use on March 4.

THE LATE EDWARD CLARK,
who was chief architect of the United States Capitol. The tradition of his family is that Mr. Clark provided the little parlor table that served Lincoln in 1861.

The early history of the table is unknown, but the tradition is that Edward Clark purchased it originally and loaned it from his home for service at the first Lincoln inauguration. Anyway, it has been in the Clark family since that time, and has been regularly loaned to inauguration committees every four years since 1861. There is a tradition that the table was first used at John Quincy Adams' inauguration in 1825 but the surviving head of the Clark family says that is not true. The only time since Lincoln's initiation to the Presidential office when it was not used was at the Taft inaugural in 1909. The exception was due to the weather on that occasion. The table was on hand, as usual, on the platform at the front of the Capitol where inaugural exercises generally take place. But the weather on March 4, 1909, was so terrific that the President was forced to take the oath and deliver his address in the Senate Chamber, and no one thought to take the historic table to him.

Attempts have been made several times by by-standers at inaugurals to steal the table, as a souvenir of the particular occasion, probably, for few have known of its long inaugural history. The most dramatic and nearest successful attempt at seizure was made during one of the Wilson inaugurations. In the confusion following the ceremonies the table disappeared. A Capitol policeman by chance saw a man passing through the rotunda inside the Capitol building with a table under his arm. He had the wit to stop the man and make inquiry, whereupon the souvenir "hound" dropped the article and passed on with the crowd.

At the Roosevelt inaugural in 1905 a small piece of the delicate beading around the top of the table was chipped off. The scar that was left indicated that a pocket knife had been used and some of the correspondents in writing of the incident intimated rather broadly that one of the members of the foreign diplomatic corps committed the sacrilege. Those who checked up on the incident are not sure, however, that the gash was made intentionally by anyone. The table may have been pushed over and the gash caused by the fall. It was repaired in the Capitol shops.

The table has a memento significance in addition to its part in Lincoln's two inaugurations and all but one of succeeding ones. It is a relic of one of the most distinguished men whose names are associated with the development of the United States Capitol building.

Edward Clark, who preserved the table and handed it down to his descendants, became chief architect of the Capitol in 1865, after several years' service under Thomas U. Walter who designed and directed the construction of the House and Senate wings of the building. Mr. Clark supervised most of the later work done on the famous structure, particularly the decorations, and also planned many newer government structures in Washington. He served as chief architect until his death in 1902, and became famous as an architect, litterateur and patron of music.

Beside this table every President, except one, beginning with Abraham Lincoln in 1861, stood while being inducted or re-inducted into office. It will be used again at the inauguration of Warren G. Harding on March 4. The table belongs to Watson F. Clark, of Washington, D. C., in whose family it has been for more than a half century.

Mr. Clark was succeeded by Elliot Woods, who still holds the place. In fact, only three men have had charge of the United States Capitol since 1852.

"Haven't efforts been made by collectors to buy the famous inaugural table?" Watson F. Clark, its present owner, was asked.

"I can't recall a single serious offer for it," Mr. Clark replied. "The only one of any kind that I know of was made recently by a second-hand furniture dealer. He saw an item in one of the local Washington papers stating that the table would again be used at the Harding inauguration. He hurried around to the house, looked the table over very carefully, noted its good state of preservation and, appearing as if he thought it to be a piece of mere old furniture, asked: 'Do you want to sell it?'

"We told him that it wasn't for sale, and it isn't, either as second-hand furniture, or as a memento or antique. It will continue to be available for service at Presidential inaugurals."

"What do you do with it between times?"

"We use it for a game of cards now and then, for example, but you may be sure we take mighty good care of it."

How Much Do You Owe?

ANY time figures get up into the millions the average man loses all sense of proportion. From then on, hundreds of millions, billions, are only rows of ciphers. But in the *Journal of Commerce* (New York) Frederic Austin published the first complete figures on international finance authoritatively compiled since the war. This is an attempted analysis of those figures in everyday terms.

For example, if we say the national debt of the United States was $1,028,564,000 in 1913; $17,005,431,000 in 1918 and $24,974,936,000 in 1920 while it is obvious that it has increased some 24 times, it is difficult to bring it home to the individual. But, if we put it this way: the debt of each individual—each person's share of the national debt—in 1913 was $11, and today each person's share of the debt is $225, that makes it clear enough, for $11 and $225 are sums well within common experience.

If there are five persons in your family, including the baby, your share of that debt is $225 times 5 or $1,125. You can buy an automobile and a piano and have enough left over for spare tires and gasoline with $1,125.

The total pre-war national debts of the world totaled $43,200,931,000; by the armistice this was swelled to $214,075,373,000; today the world owes $265,305,022,000. Put it in words—two hundred and sixty-five billions of dollars; and each billion is one thousand millions. It is a lot of money!

There are countries that actually decreased their national debts during the war. The reason is obvious: they were neutrals or else so far removed that the demands on their resources were small and their commerce was not ravaged as was the case with the Scandinavian countries, for example. These countries with a decrease are:

Ceylon, Colombia, Cuba, Egypt, Guatemala, Haiti, Peru and Venezuela.

The Dutch East Indies didn't owe a nickel in 1913, and now has a national debt of $91,871,000; Panama, which owed in 1913 only $5,100, now has a debt of $7,101,000.

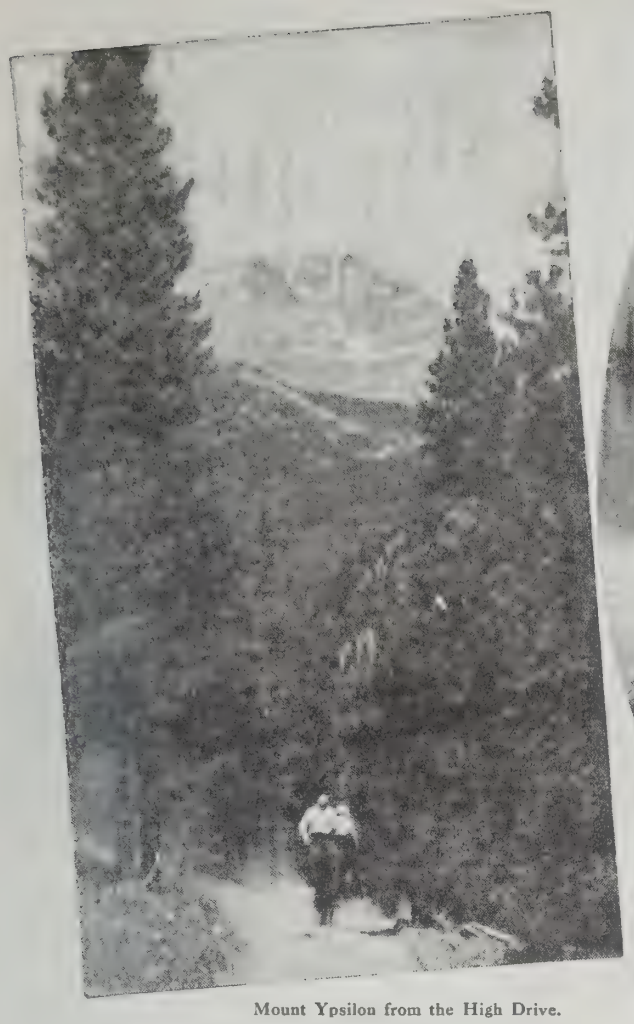
But here is a peculiar thing. Among the major belligerents the increases are extremely heavy—except in Japan. In 1913 Japan owed $1,241,997,000 and today her debt only amounts to $1,300,000,000, comparatively speaking, a paltry increase.

Every other nation in the world, with Japan, has seen its debt increase, the United Kingdom's national debt, for example, has grown from $3,485,818,000 to $39,314,000,000; but this does not include the colonial debts. Canada's increase is from $544,391,000 to $1,935,946,000. Without going into details the total indebtedness of the British Empire in 1913 was $8,121,932,000 while now it reaches $48,045,148,000.

On the Entente side, France (if you consider the British Empire by states and not as a whole) led the world in debts with $6,346,129,000, and now, irrespective of the French colonies, owes $46,025,000,000, only a little less than Germany's $48,552,000,000.

Now to put these figures in pocketbook terms, the French, with the heaviest per capita obligation in the world, owed, in 1913, $160 for every individual in the republic; today each resident of France owes $1,150; for a family of five persons this is $5,750. Great Britain comes second now, although in 1913 she was third. The British personal obligation was $78, now it is $850. Germany, in 1913, was more happily placed than any other big power; her inhabitants owed only $18 per individual; but today, exclusive of the debts of the individual states, each German is responsible for $800.

From there, there is a big drop. Austria, whose per capita debt in 1913 was $63, now has an individual burden of $525, and Hungary, whose debt worked out before the war at $70 each, now is responsible for $387.



Italy, whose personal indebtedness of $78 ranked her second in 1913, now has dropped to sixth, although her per capita indebtedness today is $365, but Australia's, whose per capita debt was no larger than Germany's $18, has become $318 for each Australian.

Then comes the United States which, despite its tremendous proportional increase, is far less heavy on the individual than in any other countries except Canada and Russia, and the last, of course, is doubtful. The United States per capita, as quoted above, is $225 as against $11 in 1913. Canada's in 1913 was $70, and now is $159. Russia's was $27 and in 1917 was $125.

Similar figures might be worked out for every nation in the world, but sufficient is indicated to show that the weight of affairs falls heavily on every living soul in the world; perhaps the most powerful argument showing the wrongness of international conduct ever produced. If proof of this last statement is deemed insufficient, here are a few figures showing how the load has gradually increased with the wars of the last two centuries.

At the Peace of Utrecht in 1713 the national debts of the world amounted to $1,500,000,000. China alone owes that much today. Eighty years later, on the eve of the Napoleonic Wars, the total had reached $2,500,000,000. At the close of the Napoleonic Wars this was $7,000,000,000. Thirty years later at the beginning of the Crimean War it was $8,400,000,000, and in 1861, at the beginning of the United States Civil War, the world's indebtedness had reached $13,400,000,000. The total had jumped to $22,400,000,000 at the close of the Franco-Prussian War and in 1907, prior to the Spanish-American, Boer, Russo-Japanese, and Balkan wars it was $30,200,000,000.

In 1914 it was $44,100,000,000, and each year of the war sent the total mounting up; it was $56,900,000,000 in 1915; $120,485,000,000 in 1916; $199,100,000,000 in 1917; $225,300,000,000 in 1918; $248,000,000,000 in 1919 and $255,000,000,000 in 1920.

Our Most Popular National Park

By ESTHER ELLIS REEKS

AMONG all our national parks—of which there are now nineteen including those in Hawaii and Alaska—none has grown in public favor with such rapid stride as Rocky Mountain. The first season after its dedication it received as many visitors as Yellowstone, the oldest and largest of our national playgrounds, while five years later it attracted as many people as the four next most popular parks combined. And still the interest grows!

Two elements here unite to bring about this state of affairs: accessibility and rare attractiveness. Rocky Mountain National Park is without doubt the most accessible of all national parks. Situated in northern Colorado on the front range of the Rockies, it is nearest the geographic center of the country. Denver, with its seven large railway systems, lies but seventy miles away; while the nearest railway station is less than half that distance. The Lincoln Highway, too, passes close to the foothills on its eastern border, and good roads lead through picturesque canyons to its doorway.

The park itself covers nearly four hundred square miles on the Great Divide, where peaceful vales and snow-crowned summits together form scenes of the most diversified beauty and grandeur. It varies in altitude from 8,000 to 14,255 feet above sea level, and embraces all the zones from Transition to Arctic-Alpine, with characteristic forms of animal and vegetable life of each. Here are hundreds of small valleys, rich of soil and remarkable for charm of setting. Here, too, are half a hundred peaks that reach to timberline or far above, with glacial lakes and dashing mountain streams almost without number, and forests of pine and spruce and fir, and carpets of gaily colored flowers, and rocky precipices, and wide, far-reaching views; and the most glorious of sunsets and sunrises and cloud colorings, and an atmosphere that gives life to the body and joy to the spirit.

It would be interesting to trace back through geologic ages the history of the formation of this most wonderful bit of seamed and sculptured earth-surface. But that would make too long a story. Suffice it to say that after many ups and downs, the region at last arose a great plateau. Then came the glacial age, when all the land was covered with ice and snow hundreds, sometimes even thousands of feet deep. With each succeeding season, other snows accumulated, pressing upon those below and forcing them slowly outward and downward toward the lower levels, while huge rock masses were caught and carried along with them, grinding deeply into the surface beneath.

Centuries passed and a warmer period came. The snows wasted away, until there remained but small glacial remnants in the upper fastnesses to tell the story of the workings of the mighty Titans of old. Towering, tumbled heaps of rock and debris were left to form the moraines of today. Great floods poured down the slopes, cutting deep gorges to be later on transformed into picturesque canyons; and uncovered cirques and hollows became the crystal lakes with which the mountainsides are gemmed. Then rock dust became converted into soil, and seeds came in some mysterious way and lodged and grew into the trees of the forests or into flowering shrubs and herbs and grasses. Verdure crowned the once barren waste, and birds and beasts and many living things found homes in this new-made paradise. The Great Creator must have called it good; and man now looks and marvels and also calls it good. So each year the people come in ever increasing numbers to see and wonder and enjoy.

Estes Park, the beautiful valley that forms the eastern entrance to what is now the Rocky Mountain National Park, was first looked upon by a white man—so far as history relates—when one Joel Estes discovered it while on a hunting trip in the fall of 1859. So impressed was he with the spot that the following summer he returned with his family to make it his home. It was three years before these hardy pioneers had sight of visitors from the outside world. Yet in spite of their isolation they seem to have been happy. They lived by fishing and hunting, and each spring and fall a trip was made to Denver to take game and fish to market and to bring back mail and supplies. We are told that at that time "the park was a veritable Nimrod's paradise. Great bands of elk, deer, and bighorn sheep roamed at will over the grassy vales and rocky mountainsides, and the streams were filled with the delicate speckled beauties that afforded the crafty angler many happy hours of exciting sport."

In course of time other settlers followed. In 1872, Earl Dunnraven, of England, visited the park on a hunting expedition and conceived the idea of securing this favored region for a game preserve. By hiring men to file on claims and turn over their grants to him, he succeeded at one time in acquiring about fourteen thousand acres. But much of this was later contested by homeseekers, and he was allowed to retain only about half that amount. This seemed too little for his purpose, which he finally abandoned. A quarter of a century later the holdings passed into the hands of others who had the interest of the country more at heart, and the village of Estes Park set about putting itself on the map.

Standing out boldly from the front of the range in the southeastern part of the park, is Long's Peak, the highest summit in all this region. This peak was first discovered in the early years of the last century by Lieutenant Pike while out on a government exploring expedition. Twelve years later it was again visited by a party under the command of Colonel Long. This was in 1819, but not until nearly fifty years later was the first successful attempt made to reach its top. Now a well-marked trail leads to the highest point, and the ascent is made by several hundred tourists each year.

No grander view can be found in any land than the one from this pinnacle. At an elevation of more than two and two-thirds miles above the sea, one may look down to the east across lesser summits to far-off plains with a vision limited only by the power of human sight. To the west, the north, the south, the horizon is marked by snow-covered peaks touching the bluest of cloud-flecked skies. A nearer view gives one a glimpse into the Wild Basin at the foot of the peak to the south, and the Wild Gardens on the north, each clothed in rich forests set with many small lakes that mirror the scenes above and about them. To the east, at the foot of a granite wall that drops 2,500 feet, lies Chasm Lake, ice-covered for eleven months out of every twelve.

The first homesteaders took up land on the meadowy slope near the foot of Long's Peak in 1875, and their home became the stopping place of visitors to this region. Here in 1884, Enos Mills, now well known as a writer and a naturalist, but then a young man in his teens, first acted as guide to parties climbing the summit. Some years later he bought the place and converted it into the popular resort known as Long's Peak Inn. It was largely through his efforts that in January, 1915, an act of Congress set aside this and the surrounding wonderland as a national playground that its beauty might be kept unspoiled and its wild life preserved for the interest and enjoyment of future generations.

Standing to the east of Long's Peak are Mount Meeker on the south and Mount Lady Washington on the north. These three summits are believed to have once constituted a single great dome, out of which a bygone glacier carved the present skyline. In witness of this, a large moraine, known as Mills Moraine, lies along the eastern base.

From Long's Peak, the main range of the Continental Divide extends in a northwesternly direction. Among the more noteworthy of the peaks included here are Storm, Thatch Top, Taylor, Hallet's, Flattop and Stone's. In this region are to be found several interesting glaciers, numerous wild gorges, and lakes of the most romantic beauty. In an open amphitheater between Thatch Top and Hallet's peaks, lies the Loch Vale country, with the bewitching Loch in the center surrounded by many smaller lakes of crystalline clearness.

Specimen Mountain, on the extreme northwest, is remarkable as the crater of a long extinct volcano where many rare specimens of interest to the student of geology are found, and where elk, deer and mountain sheep come to lick the alkaline salts that issue from the soil.

In the northern part of the park, a second range, known as the Mummy, rises at almost right angles to the other. Here are half a dozen peaks reaching to 13,500 feet or thereabouts. Most interesting of these are Hague's Peak, on which is Hallet Glacier, with its many gorgeous crevasses and ice caverns, and Ypsilon Mountain, taking its name from the great Y of snow that lies all the year around in two uniting gorges on its side. East of the Mummy Range and about the village of Estes Park are numerous smaller peaks ranging between 10,000 and 12,000 feet in height, to the tops of which good trails have been built, and from which fine views may be obtained.

On the western slope the country is less rugged and startling in outline, but equally beautiful in a different way. This portion of the park has in the past been much less visited, owing to the greater difficulty of reaching it. Grand Lake, the largest body of water in the state, lies toward the south at the western entrance.

In September of this year the last stretch of the new Fall River highway was completed at an enormous expense, bringing for the first time the two sides of the park into direct communication with each other. This will mean the rapid opening up of a large region that has hitherto been almost inaccessible. It took five years for the building of this road. Yet over it in one day the traveler may pass from beautiful vale, through deep-cut gorge to lofty mountaintop, and down into a still different world on the other side. At one place, for many miles, the road follows the skyline 12,000 feet above the sea. There is every reason to believe that it will soon be made an official part of the Lincoln Highway, and the most used of all the thoroughfares crossing the continent.

The Danger at Our Doors

WHEN politicians fail us, our hope rests in the man held under our system to responsibility for the public health and vested with the "autocratic" authority that alone enables him to get action. Just now while the Senate of the United States, influenced by a powerful international Jewish cabal—bent on flooding the country with immigrants from Eastern and Central Europe utterly regardless of the health and welfare of the American people—is fiddling over the immigration restriction bill sent to it by the House several weeks ago, the plague has been seeping into the country.

Aroused by the menace, Dr. Royal S. Copeland, New York's health commissioner, is sounding an alarm that should wake up even the sleepy Senate and show the people how exigent is the measure enacted by an overwhelming majority in the popular branch of the national legislature. Dr. Copeland declares that the greatest menace confronting the United States today is the possibility of a typhus plague. So great is the danger, he says, that it can only be averted by immediate and co-operative action on the part of Federal, state and port authorities to combat the influx of immigrants from the typhus-infected regions of Europe.

That should simplify the issue for the Senators. Do they wish to be held responsible for exposing the whole country to a plague of the most dangerous communicable disease known next to the bubonic plague, and beside which our recent influenza epidemics with all their terrible toll of human life would be as nothing?

Keep Them Busy

IT HAS often occurred to the thoughtful onlooker in our police courts that, when boys or girls are brought up for sentence, it is the parents of the young criminal, rather than the child himself, that should be punished. In many cases, the causal relation of parental neglect to the child's criminality is obvious enough. Just now the whole problem of the child in his relation to the home, the state and the school is coming up for live discussion. The facts that arouse public attention are startling enough. We are told that teachers everywhere are complaining that school work is slighted because the children frequent the motion picture theaters, the dance halls and the pool rooms. Physicians and nurses declare that low health conditions prevail among school children to an alarming degree. Juvenile courts report earlier delinquencies and increasingly frequent and serious lawlessness among the young people. Newspapers print reports of juvenile holdups and burglaries almost daily.

Alma L. Binzell, professor of child training at the University of Minnesota, suggests that neither the children nor their parents are chiefly to blame for this state of things. The fault, she says, lies with the state, in its failure to give to parents and prospective parents the training that would make child rearing in the home an intelligent and successful process.

Is it not possible that the learned pedagogues are overlooking some rather elemental considerations in this whole matter? Some 30 years ago, Charles Pratt, a pioneer Standard Oil millionaire and a very practical and successful business man, devoted years of careful thought and thorough investigation to the problem of how he could spend his money to greatest advantage. He came, somewhat sadly, to the conclusion that very little could be done for grown-ups, compared with the immense possibilities of child training. So he established the Pratt Institute in Brooklyn for the simultaneous training of hand, heart and head in skilled trades and handicrafts. A little later, a Philadelphia millionaire, under the sage advice of Dr. C. R. Henderson, an educator who will rank among such daring and illumined pioneers as Froebel, Pestallozzi, Horace Mann and Montessori, started the Drexel Institute on much the same lines. The late Elbert Hubbard did good work in his own little industrial community in an endeavor to demonstrate the all-round benefits of combining thinking and working, learning and earning. In each of these instances it was proved that if we keep the minds and the hands together interested and busy in useful and beautiful creation, the wholesome and enjoyable activities of the rightly-directed school-shop need not fear any competition from the unwholesome and inane schools of crime and degeneracy into which the "movie" is so often degraded.

Why Russia Starves

THERE is one paragraph in the recent letter of Under-Secretary of State Davis to Alton B. Parker that is especially enlightening as to Bolshevist methods. The letter was an answer to certain charges publicly made by the League of Free Nations Association to the effect that the United States Government is maintaining a blockade of American trade with Russia, even to the extent of preventing shipments of soap and medical supplies.

Mr. Davis declares specifically, "There is no restriction on the export to Russia of medical supplies, soap and the common necessities of life." He further adds that the only restriction maintained by this government on export trade with Soviet Russia is the restriction on the export of munitions or commodities susceptible of immediate military use, special export licenses being required for the shipment of commodities coming under this classification.

Then how about the "food and medicine blockade" in regard to which the Bolshevists and their British and American sympathizers have been making so much noise?

Mr. Davis tells us: "The Department of State has taken an intense and continual interest in the possibility of arranging for large scale relief work by strong and reputable organizations. The difficulties which have stood in the way of accomplishments in this matter have been raised not by this government, but by the Soviets, who cannot find in their theory of communism any excuse for private philanthropy . . . . The only relief work which the Soviets will tolerate is the direct gift of supplies to the Soviet Government, to be distributed by them as their own largesse . . . . The official obstruction to the feeding of sick Russian children by Americans has come not from this government, but from the Soviets."

Plainly, the Moscow Autocracy has no qualms about letting Russian children by the thousands sicken and die for lack of food and medicine, rather than allow them to be saved through the benevolence of American "bourgeoisie." Herod repeats himself!

Vulcan Proclaims Peace

IT LOOKS as if Vulcan was at last demanding a new and bigger job than the forging of sword and breastplate. If ours is the age of steel, as has often been suggested, may it not be that following the fifty-one month era in which the world gave itself to beating its plowshares into cannon and its pruning hooks into rifle barrels and machine-guns (to the heart-rending grief and impoverishment of humanity), we shall witness a reversal of the process with some approach to the fulfillment of ancient prophecy?

This thought is surely encouraged by a recent utterance of a great Japanese iron master, professor of mining and metallurgy in the Imperial University of Tokyo and expert adviser for the South Manchuria railways, the Viscount Incuye. He is visiting this country to study conditions in the American steel industry and incidentally to purchase about a million dollars' worth of steel-working machinery. Says Viscount Incuye: "War talk in either Japan or the United States is utterly unreasonable and stupid. I have every confidence that whatever matters are still at issue between the two countries will be settled on a common-sense basis. Among thinking men in either country, only the most friendly relations are desired."

The devotion of our forges and foundries the world over to the production of steel for railways and bridges, machinery and agricultural implements, bridges and structural beams and crosspieces must certainly make for a nobler humanity and a truly richer and happier world. The madness of diverting national energies and national wealth to mutual slaughter and destruction has surely had its day. "Sorrow may endure for a night, but joy cometh in the morning!"

Domestic Disarmament

DISCUSSION of international disarmament may be more or less academic a d remote. The alarming frequency, in all our great cities, of murder by shooting incidental to robbery is sharp reminder that the question of disarming the thug is one of very practical and pressing importance. Disarmament may well, like charity, begin at home. It might thus prove an actual beginning of the ardently-hoped-for world-wide laying down of arms.

Stringent laws are in force in regard to the sale of poisons. Why should we not have even more stringent laws against the sale of revolvers? Thousands, perhaps millions, of revolvers were thrown on the market with the demobilization of our army. Many demobilized men retained this item of equipment. It is certainly not at all difficult to obtain one. The revolver is a "deadly weapon." Its one purpose is the taking of human life. To permit promiscuous possession of this arm is to permit promiscuous killing. It should be made impossible for any one to obtain a revolver except for purposes of police protection or self-defence.

An important part of any program of national disarmament is the taking of the whole business of the manufacture and sale of arms and munitions out of private hands, thus removing, to that degree at least, the money-making incentive from the business of human slaughter. If we really want to diminish the frequency of murder in this country, we will not be content with the infliction of a light fine for "carrying a concealed weapon." We will begin by placing the sale of deadly weapons to individuals wholly in the hands of the public authorities, preferably the local police in each town. Licenses to carry firearms should be granted only to watchmen, night workers and other persons having good reason to fear night attacks. Their applications should be indorsed by employers or other reputable citizens and verified by the police. Licenses should be absolutely denied to persons with criminal records. Licenses issued to householders for protection against burglars should not include the right to carry the weapon outside the house. Every weapon should be stamped with a number and a careful record kept. And a good stiff license fee should be charged.

Then perhaps we may be able to counteract one of the worst effects of the war in its cheapening of life and the ready "mounting of a gat" and readiness to pull it shown everywhere, even by college boys.

Blocking Reconstruction

THIS is an amazing tale of commercial greed that comes to us from France. It seems that about a year ago General George W. Goethals, the builder of the Panama Canal and first governor of the Canal Zone, submitted to the French Government a plan for Franco-American co-operation in the speedy and sorely needed reconstruction of the devastated areas. After fullest investigation, the plan received the approval of the then Premier M. Millerand, and of President Déschanel. The genius of the great American engineer, probably the world's foremost genius in construction, was deemed to have solved the stupendous problem, which seemed to be hopelessly languishing, of a restoration of these shot and shell-torn regions to the happy and profitable homing and industry of a long-afflicted population.

Now we are told that English engineering and building contractors and English financiers have brought influence to bear on the Lloyd George Government to cause a blocking of General Goethals' plan. This manifestation of trade greed and jealousy is rousing the French people to deep resentment. Only the other day, the *Lanterne* published a leading article from the pen of M. Georges Barthélemy, a prominent member of the Chamber of Deputies, strongly protesting against what he calls France's shameful economic subjection to England and threatening, in behalf of France's eight million war sufferers, to force the government to take up and carry through General Goethals' scheme.

British firms have already obtained vast contracts for the reconstruction of devastated districts in Belgium. In the very nature of things, it is likely that they would be allowed to share in the work planned under Franco-American auspices. One thing is certain, and that is that the question of profits, present or prospective, should not be allowed longer to interfere with the speedy rebuilding of the homes of the unfortunate peasants and villagers destroyed in the war. They have already been compelled to endure the hardships and misery of two winters without decent shelter since the cessation of hostilities. To force a third such winter of wretchedness and suffering upon these unhappy war victims would be a crime against humanity.

Mr. Ford's Page

ONE of the common habits people fall into is to explain everything by the term "business." We explain depression by saying that "business is bad." We explain far-reaching changes by saying that "business is undergoing a readjustment." We look hopefully toward the time "when business will pick up again."

The mistake is rather childlike, as if we should declare that the thermometer governs the weather. To be sure, the thermometer is "down" when it is cold, and "up" when it is warm, but the thermometer is acted upon by other forces, it does not act upon them.

Business is a barometer. It registers various conditions. But it is not the master-force in the world. It is a sign of life and creative activity; more than that, it is the sign that for the moment the interaction of all the social elements has reached a degree of harmony sufficient to give all men the happiness of being busy and the satisfaction of being supplied. So, when it happens that business is "down," like the thermometer, it does no good to put it "up" by artificial means. The thing to do is to change the general condition, whatever it may be, and business will reflect the result as surely as the mercury rises with the first mild days of spring.

Many other adjustments must occur before we get the "business adjustment" which people believe is the one thing necessary.

And these adjustments are now in process. That is a point we ought to bear in mind: *these adjustments are now going on.*

People often say "things are at a standstill." No, they are not. If we could see the whole economic process, not merely the one point where it makes contact with us as individuals in our jobs, we should see that nothing is at a standstill, but that everything is moving and changing—even now, when everything seems to be dull.

What we call "hard times" are economically the beginning of "good times." That is, a period of depression is not the tail end of the old era, it is the introductory period of a new era. Now, that idea is worth getting, for it shows us as by a light just how foolish we mortals are in the matters which most vitally affect us in our economic interests.

We think that this business slump is the end of the old period; *it is really the beginning of the new.* If we had been wise we would have recognized that the feverish prosperity of last spring and the preceding winter were the real "bad times" of which we should have been afraid. Wise men told the people that, but did anyone heed? Only a few. That feverish, flashy prosperity during which money was spent in fast and furious manner, and everybody was independent and felt that they could walk out of their job any time they wanted; that complete let-down of all common sense in expenditures and manufacture and labor—that comprised our hard times! But we did not know it.

That period had to end. That was the ruinous period. All the damage was done then. And when it did end, then readjustment immediately began. The slow-down and stoppage was the first sign of healthy recovery from the fever of irresponsible folly. The slow-down was not the disease; it was the convalescence. We were sick, sick, sick during what we thought was the heyday of our economic golden age; so sick, that in our delirium we mistook dangerous economic conditions for "prosperity."

Whatever disaster may be falling now is not a consequence of present conditions but of former conditions. From this time forward, indeed from the time the fever left us, the general economic condition has been on the mend.

When people are able to see that the time to be fearful is in times of irresponsible prosperity, in the drunken revel of profiteering—then, we may hope for the prevention of periods of what we call "hard times." The only way you can eliminate the periods of convalescence is by eliminating the periods of illness. And the only way to eliminate economic illness is not to confuse it with economic convalescence, as the people have done for a century.

The whole matter is so intertwined that you cannot speak of it under such terms as "money," "business," "credit," or the like. These only represent a special angle of the general whole. The crucial readjustments that take place at times like this are not fiscal at all, but human. The whole secret of economic recovery is stated in human, and not banking terms.

When a crowded excursion ship is lurching too heavily on one side, threatening to capsize, what is the remedy? Readjustment of the burden. If all the people have rushed to the port side, have half of them return to the starboard side. This equalizes the burden. It is evenly distributed, and thus more easily carried.

Something like that has happened to the economic ship. Too many people crowded over to one side. The City constitutes but a small part of the world. The Manufactory constitutes only one part of the work of the world. Yet everybody wanted to crowd into the City, and to enter the Factory. And the result was that an artificial congestion arose, and we called the fever of that congestion by the delusive name of "prosperity." All sorts of unnatural things came out of it. Unnatural ideals of life. Unnatural exaggeration of the value of money. Unnatural disproportion between qualities of materials and the price asked for them. Unnatural notions of what constituted "a good standard of living." Unnatural waste of materials in cheap and gaudy "luxuries" which were only toys. The whole condition was unhealthy in the extreme, but because there was a hectic flush upon its features men thought it was the color of "economic health." It was the consuming fever of economic dissipation.

You see, therefore, what line some of the readjustments had to take. People had to do a lot of readjusting themselves What is the meaning of the "For Rent" signs in our cities and the deflation of the rent profiteers' balloons? Simply this: people are readjusting the inequality of the population between country and city. Thousands of people are going back to the real country, which lies outside the cities.

The people who are now going back to the country are an advance guard. The time is coming when if industry needs them it will go to the country and get them, erecting pleasant little workshops beside the local streams, and begin industry anew under natural conditions. It is natural for people to like industry, to want to work in industrial institutions; but it is unnatural that a million people should have to be packed in the narrow area of the City in order to gratify that desire.

We must not think, therefore, that those who are leaving the cities are the defeated ones. Not at all. Heaven forbid that our standard of success should ever be the present type of city life! Those who are going back are the vanguard of a new movement which will continue until a proper adjustment has been reached.

So, all these wholesome things are occurring now. The whole situation is mending fast. No one will doubt that the people are in a much more wholesome frame of mind than they were a year ago. And there can be no prosperity without this sound state of mind on the part of the people. The first essential of prosperity has therefore come back already: the fever has left the public mind.

HUMAN adjustments come before business adjustments. It is not business that makes life, but life that makes business. Don't get the cart before the horse when you are thinking about this sober period of "business depression." The remedy is not fiscal only, but human. Business is a barometer that registers the economic weather; it does not make the economic weather; people do that. This slow period is not the disease; it is the convalescence. The disease raged last spring and the preceding year, when everything was going ahead feverishly. People mistook the hectic flush of financial folly and human extravagance for the color of economic health. We were sick then. We are improving now. This is a preparatory period for a new era. It is not the sick dregs of an era slowly passing. The change began the moment the folly and fever stopped.

A revised photograph of the second inauguration of Abraham Lincoln, in 1865. The Great Emancipator is shown reading his famous address on that occasion. He stood beside the table first used at the Lincoln inauguration in 1861, and to be used again by President Warren G. Harding, on March 4. The original photograph gave only a dim outline of the table. The artist that retouched the picture from which the plate for this picture was made no doubt was unaware of the existence of the actual table and unfamiliar with its real form.

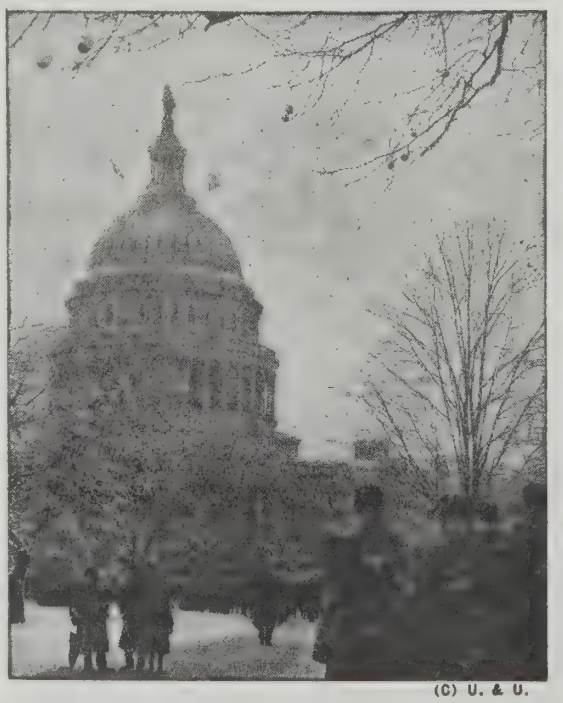
Our Quadrennial Show

By CARL SCHURZ LOWDEN

PRESIDENT-ELECT HARDING is not superstitious. Friday inspires in him no fear nor terror. We, the people, are not superstitious; that is, we hope we are not, but (if the truth must be told) we do occasionally knock upon wood, and we do have a hankering for seeing the new moon over the proper shoulder.

The particular superstition I have in mind is founded upon fact. The oracle that watches over this nation is not giving a bouquet of good omens to the next occupant of the White House. Rather, he is doling out the opposite. This untoward state comes about because the fourth of March, 1921, falls upon Friday which is not an auspicious day presidentially speaking.

For whether we are superstitious or not, Friday's inaugural record remains bad. Each of the Presidents it sponsored met some dismal end. Garfield was slain. John Quincy Adams failed of re-election, and Pierce did not have the heart to try for a second term. Precedent has given a hard row to the twenty-eighth incumbent; and the outlook is not extremely reassuring, but nevertheless the past should not invariably be accepted as the criterion of the future.



There has been much wailing and gnashing of teeth at Washington because the President-elect prefers a simple ceremony minus the usual frills. Society had expected a revival of the inaugural ball which has been an outlaw in the Wilson administration. Society has expected much which will not be; that is, unless a slip or two should intervene between the announced plan and the observance thereof.

Thrift is to be the keynote of the Harding régime, and it will be first introduced on the fourth of March. The President-elect likes the homespun principles that Franklin spread broadcast in his "Poor Richard." He desires a decline in public expenditure. He thinks "America will never get its hat on straight" amid extravagance; so he proposes to give a good example at the outset.

The ceremony will be brief and simple. Edward D. White, Chief Justice of the Supreme Court, will administer the oath which takes this form: *I do solemnly swear that I will faithfully execute the office of President of the United States and will, to the best of my ability, preserve, protect, and defend the Constitution of the United States.* President Harding will then repeat the words, kiss the open Bible conveniently held for him by the clerk of the Supreme Court, and will next receive congratulations.

On the ride to the Capitol building, the scene of the great event, President Wilson will occupy the right side of the car, and Mr. Harding will sit on the left. About an hour later they will return to the White House. On this ride President Harding will sit upon the right, the position of highest honor, and Professor Woodrow Wilson on the left.

Perhaps the most elaborate inauguration in the nation's history was that of General Washington. Flowers were rained at his feet and songs chanted at various towns on the route of his 200-mile triumphal march to New York. At Elizabethtown Point he boarded a barge rowed by thirteen men dressed in white uniforms and fringed caps. Ships fired salutes of thirteen guns, church bells rang out, and flags were everywhere displayed. Chancellor Livingston administered the oath, and shouted, "Long Live General Washington!" which was enthusiastically echoed by the concourse of people but later condemned as too monarchial in tone. That evening the houses of the city were ablaze with light while huge pieces of fireworks illuminated the sky.

(C) U. & U.

The morning of Inauguration Day for President Taft brought the greatest storm ever experienced by Washington. Regardless of the weather, however, the crowds, as here shown, packed the square before the Capitol. On the left, astride their sleek looking horses, a detachment of cavalry wrapped to the chin in their heavy army overcoats passing the Capitol on their way to the spot assigned to them during the ceremonies.

In strong contrast to this ostentation was the plainness that characterized Jefferson's accession to the office. He walked to the Capitol while a battery of guns fired a single salute; and at the conclusion of the ceremony he was escorted to the White House by two companies of militia and a delegation from the two Houses of Congress. Jefferson had planned to use a coach drawn by a pair of blooded bays, but the equipage unfortunately was not ready at the time of the inauguration.

John Adams, his predecessor, churlishly refused to act as Jefferson's escort. "I am unwilling," he said, "to enact the rôle of captive chief in the triumphal procession of the victor to the Capitol." Evidently Adams was still disgruntled over his inability to obtain a second term and morbidly jealous of the man, in many respects his antithesis, who had displaced him. This petty action did not add to the people's estimation of him.

This man's son, John Quincy Adams, figured in a similar episode. However, historians generally concede that he was not primarily at fault. The campaign had engendered an extreme animosity by General Jackson toward President Adams. Though it was the established custom for a president-elect to call upon the retiring executive a few days before the inauguration, "Old Hickory" carefully avoided the White House. Adams felt that he could not overlook such a breach of official etiquette and also maintain his own self-respect; so he quietly left his four-year residence on the third of March, and joined his family at Meridian Hill.

"The President-elect was inaugurated today," the editor of the *National Intelligencer* wrote. "Mr. Adams did not attend. General Jackson came here a citizen; and has never called on the President since he arrived. The marked disrespect to the President and the office could not be otherwise than intentional. No explanation has ever been given by himself or his friends. The more moderate of them disapprove of it, and consider it as an insult to the office as to Mr. Adams personally. They appear to regret sincerely that General Jackson should have taken that course to gratify his private resentments."

If Jackson had not been in mourning for his wife, his inauguration would have been truly spectacular; even so, the ceremony was elaborate. He rode to the Capitol in a carriage made from the timbers of the famous fighting frigate Constitution. After he had delivered his address and returned to the White House a crowd of twenty thousand persons followed him and broke thousands of dollars' worth of cut glass in a mad

effort to get the fine refreshments that were served. "The reign of King Mob," said Judge Story, "seemed triumphant."

Many observers reckoned the size of the crowd as twenty thousand. Certainly such an assemblage had never been seen in Washington before that time. Daniel Webster gave the conservative estimate of eight thousand as the number of persons that thronged the course of the grand parade, and he asserted that some of them had come five hundred miles to see the transfer of authority.

President Johnson snubbed General Grant by his absence when the latter was inducted into office. The man who had undergone an impeachment longed for the familiar scenes of his boyhood and his old home. He desired to escape from the locale of his trial and troubles. Crossing the threshold of the official domicile at noon on the fourth of March, he told a member of his cabinet, "I fancy I can already smell the fresh mountain air of Tennessee."

Many of the newspapers condemned Johnson's course as an "undisguised exhibition of the white feather," a cowardly act. "He should rather have taken the carriage assigned to him in the procession," one asserted, "and ridden abreast of Grant, and if need be had a fierce race with him up Capitol Hill, and thus died game. George Washington and Andrew Jackson, whose example he emulated in his Farewell Address, would never have skulked from the executive mansion like a thief in the night."

The absence of Johnson did not dampen the grand display which was the greatest of its kind on record. Grant had been the leader of victorious armies in a hard-fought, fratricidal conflict. The Union had been preserved. So the nation received its renowned commander with a wide variety of frills and a notable military demonstration.

When James Madison succeeded Thomas Jefferson, the nation was on the verge of war. This ominous condition caused the assembling of ten thousand persons, a number then absolutely unprecedented, for the occasion. The mass of people surged through Washington, then just an overgrown village; and cannon boomed from morning till night. Persons anxious to hear Madison's address were disappointed, as his voice lacked timbre and did not carry well.

"I went to the Capitol," John Quincy Adams put down in his diary, "and witnessed the inauguration of Mr. Madison as President of the United States. The House was very much crowded, and its appearance very magnificent. He made a very short speech in a tone so low that he could not be heard, after which the official oath was administered to him by the Chief Justice of the United States, the four other judges of the Supreme Court being present and in their robes. After the ceremony was over I went to pay the visit of custom to the President."

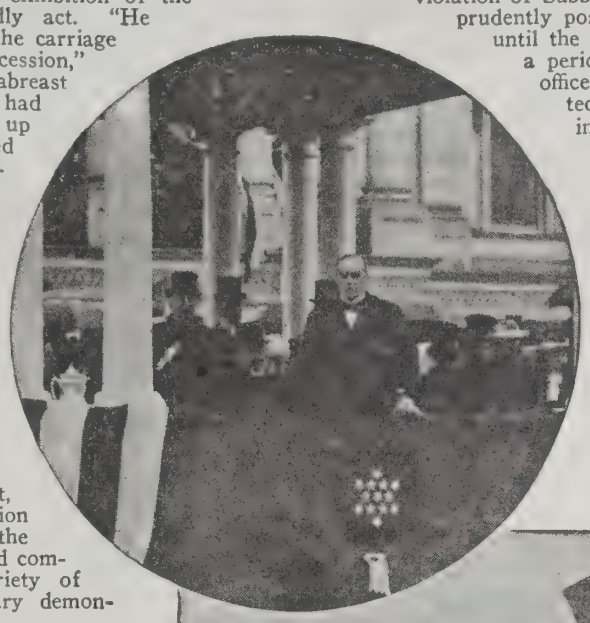
Apparently the first experience proved an insufficient lesson for the man whom Washington Irving called "a withered little apple-John." Four years later his voice had not improved and the same complaint was again registered. Mrs. Seaton, the wife of one of the owners of the *National Intelligencer* sketched the spectacle in this style:

"Yesterday the most crowded and interesting sight we ever witnessed was presented to our view in the inauguration of Mr. Madison. Escorted by the Alexandria, Georgetown, and city companies, the President proceeded to the Capitol. Judge Marshall and the associate judges preceded him and placed themselves in front of the speaker's chair, from whence the chief magistrate delivered his address. But his voice was so low, and the audience so very great, that scarcely a word could be distinguished. On concluding, the oath of office was administered by the Chief Justice. The little man was accompanied on his return to the palace by the multitude; for every creature that could afford as much as twenty-five cents for hack hire was present."

The lowness of the President's voice marked each of the Madison events; but it was a bit of genuine sentiment and affection, many years afterward, which made the Garfield induction stand out vividly in the memory of the numerous onlookers. With the oath-taking done and the Bible kissed according to the well-established custom, the new executive turned toward a wan woman, seized her, kissed her, and said:

"Mother! YOU have brought me to this."

It was the fervent tribute of a son to a parent. His voice was filled with emotion, and she was overcome. Certain members of the audience, the feminine contingent especially, sobbed and drew forth handkerchiefs to dry their tears.



William Henry Harrison took the oath after he had read all except the last paragraph of his inaugural address from the east portico of the Capitol. He then finished the reading, mounted his white charger, and headed the parade to his newly-won home.

The feature of the procession was a log cabin filled with people and bearing reminiscently on its sides the various majorities cast by each of the Whig states at the termination of the campaign. Another float consisted of a cotton mill run entirely by women. As fast as the cloth was woven strips of it were cut and thrown to the people who greedily grabbed them for retention as humble souvenirs of the gala day.

The first President to take the oath of office outdoors was James Monroe. The House wanted the honor, and the Senate wanted it. Monroe said he would give it to neither of the "bad boys," so he chose the plaza at the east of the Capitol. During the installation a pair of wild eagles flew majestically over the dome of the spacious building. The incident thrilled and elated the people; for it was interpreted generally as a harbinger of real prosperity, happiness and good government.

Four years afterward the fourth of March appeared on the calendar under the Sunday column. Such a situation had never arisen before. Monroe wished to refrain from any act which might be construed as a violation of Sabbath sanctity; consequently he prudently postponed his second induction until the following day. Thus during a period of twenty-four hours the office of chief executive remained technically vacant, and in that interval the United States was a nation without a head.

If there can be any comparison between vacancies to determine the degree thereof, the interregnum from the moment the Polk Government ended to the moment that "Old Rough and Ready,"

President McKinley making his inaugural address in front of the Capitol. President Roosevelt (then Vice President) is seen at his left, seated.

(C) U. & U.

(C) U. & U.

Preceded by the outgoing President (Roosevelt), the incoming First Citizen of the Land (in this case Mr. Taft) is seen entering the carriage at the White House. On this day the snow, falling in heavy flakes, blanketed the streets. To the right of Mr. Taft is the late Major Butts, who, it will be remembered, lost his life on the ill-fated Titanic.

(C) U. & U.

President Roosevelt saluting the crowds on inauguration day. The trip to the White House this year probably will be made in a motor car.

Zachary Taylor, took the oath may be regarded as more intense than that of Monroe who merely succeeded himself. Taylor began a day late as, due to the interjection of Sunday, he did not become President until the fifth of March, 1849.

Considering now our own times, it must be admitted that President Wilson bravely faced a possible storm of disapproval from the religious world at the expiration of his first four years. The Sunday dilemma did not deter him. He treated Sunday on this occasion precisely as if it were Monday or Wednesday or any other day of the week.

"I might have omitted today's ceremony," he said of the Sabbath incident, "under precedents made by my predecessors. But I decided to comply literally with the constitutional stipulation that the President of the United States shall take office at noon on the fourth day of March."

The public inauguration occurred on Monday, and continued into the night with colossal pieces of fireworks which included a 500-foot reproduction of the flag. The gravity of the threat of war, however, became obvious to the participants in the grand parade when they passed between lines of soldiers stationed on Pennsylvania Avenue as an extra guard for the President and his official family. Few spectators sat in the hastily-constructed stands along the route; for the day was cold and generally forbidding in its aspect

Inauguration weather has often marred the "best-laid schemes of mice and men." Monroe, John Quincy Adams, Jackson, Van Buren, William Henry Harrison, Taylor, Pierce, Buchanan and Lincoln all came in to the accompaniment of fine weather, at least comparatively fine for early springtime. Polk, Garfield, Benjamin Harrison, Cleveland, Taft and Wilson made stormy entrances. At Grant's second inaugural the temperature remained severely cold at four degrees above zero; some of the West Point cadets were overcome and had to be revived in the White House.

Persons have died because they came to Washington to see the quadrennial pageant; they remained too long outdoors, and the inclement weather made them easy victims of such a disease as pneumonia. The suggestion has often been offered to Congress that the date should be taken away from March and given to a balmy month, May or June. In 1913 Senator Shafroth presented a resolution for an amendment to the Constitution to change the date, but it soon died. Revised and again introduced, this time to the next Congress, the resolution encountered the same adverse fate. Congress has given no attention to the matter since. Yet, is not anything that will save lives worth while? And is it not even more worth while if it will give comfort to thousands of our best citizens every fourth year?

A statistician, interested in the subject of Washington weather on each fourth of March, looked up the records covering a period of forty-seven years. Of this number he found that fourteen had registered a temperature of fifty degrees or more; but during twenty-seven years, nearly twice as many as the warm examples, the mercury in the thermometer had descended to the freezing point or lower. On sixteen of these March days there had been some precipitation which in ten of them took the form of sleet or snow, the remainder being the ordinary variety known as rain. These figures certainly reveal the vagaries of the weather early in March, and eloquently set forth the month in its true character of tempestuousness and general disagreeability.

A howling blizzard blew Mr. Taft into the White House, and also snatched away the hats of soldiers and citizens. He called it "a moist drama," a description entirely too mild. The city was snowbound, the trains were delayed, and traffic was so tied up that some of the visitors did not arrive in Washington in time to see the event. The weather deeply disappointed Taft himself, as he desired his incoming staged outdoors.

When the show was over the new President and his wife entered a carriage drawn by four splendid bays, and drove to their new home. It was the first time in our history that the "First Lady of the Land" had accompanied her husband on his return from the august initiation. The innovation seemed to please the people.

Polk appears to have been the first chief executive to feel the discomforts of the open-air induction. The formalities proceeded with difficulty while a spring blizzard displayed its vigor and made the weather truly execrable. Rain deluged all the participants in the parade which included the capital's clergy and the members of the cabinet.

Hayes was the first President to take the oath of office in the White House, and none have since honored him with imitation. The east front of the Capitol has been the favored spot of the campaign victors, though the Senate Chamber is substituted whenever rough weather forces the staging of the drama indoors. President-elect Harding also desires a solemnization where the sky will be the roof. But, of course, the weather will have something to say about that.

"Give me now wisdom and knowledge," reads the tenth verse of the opening chapter of II Chronicles, "that I may go out and come in before this people, for who can judge this thy people, that is so great?" It was to this passage that the Bible opened when McKinley took his oath of office.

Roosevelt chanced on two verses of the first chapter of the Epistle to James. "But be ye doers of the word, not hearers only," is the theme of the passage. It was marvelously applicable to "T. R."

Almost invariably the clerk buys with his own money the Bible that is used. He does this because Congress expends only by appropriation; and if he waited for Congress to appropriate, he probably would not get the book on time. President Cleveland twice gladdened the clerk, for a book that had been given to him by his own mother was used.

The Negro bishops of the country gave a Bible to McKinley shortly before one of his inaugurations. It was the biggest book the clerk of the Supreme Court had ever encountered. "One of the bishops," he said afterward, "called at my office with the Bible on the day preceding the inauguration. It was a huge affair of the type known as family Bibles."

On the day immediately following the ceremony it is the pleasurable duty of the clerk to present the Bible to the "First Lady of the Land" as a keepsake

Rule of the Jewish Kehillah Grips New York

"A Government Within a Government" Vividly Illustrated: Jewish Solidarity Perfectly Organized in a Program for Power

ARE the Jews organized? Do they consciously pursue a program which on one side is pro-Semitic and on the other anti-Gentile? How can a group so numerically inferior wield so large an influence upon the majority of the world?

These are questions which have been asked and which can be answered. The clan solidarity of the Jew, the ramifications of his organizations, the specific purpose which he has in view, are themes upon which there is any amount of "say so," but very little authoritative statement. It may therefore be useful and informing to study one or two of the more important Jewish organizations in the United States.

There are Jewish lodges, unions and societies whose names are well known to the public, and which seem to be the counterpart of similar groups among the non-Jewish population, but these are not the groups upon which to focus attention. Within and behind them is the central group, the inner government, whose ruling is law and whose act is the official expression of Jewish purpose.

Two organizations, both of which are as notable for their concealment as for their power, are the New York Kehillah and the American Jewish Committee. By concealment is meant the fact that they exist in such important numbers and touch vitally so many points of American life, without their presence being suspected.

If a vote of New York could be taken today it is doubtful if one per cent of the non-Jewish population could say that it had ever heard of the New York Kehillah, yet the Kehillah is the most potent factor in the political life of New York today. It has managed to exist and mold and remold the life of New York, and very few people are the wiser. If the Kehillah is mentioned in the press, it is most vaguely, and the impression is, when there is any impression at all, that it is a Jewish social organization like all the rest.

The "Kahal" or Local Soviet

THE Kehillah of New York is of importance to Americans everywhere because of two facts: it not only offers a real and complete instance of a government within a government in the midst of America's largest city, but it also constitutes through its executive committee District XII of the American Jewish Committee, through which pro-Jewish and anti-Gentile propaganda is operated and Jewish pressure brought to bear against certain American ideas. That is to say, the Jewish government of New York constitutes the essential part of the Jewish government of the United States.

Both of these societies began at about the same time. The records of the Kehillah state that the immediate occasion of its organization was to make a protest against the statement by General Bingham, then police commissioner of the City of New York, that 50 per cent of the crime of the metropolis was committed by Jews. There had been a government investigation into the "White Slave Traffic," the result of which was a direct set of public opinion into channels uncomplimentary to the Jewish name, and a defensive movement was begun. There is no intention to rake up past scandals, unless it shall become necessary; it is enough to say here that, very soon afterward, General Bingham disappeared from public life, and a national magazine of power and influence which had embarked on a series of articles setting forth the government's findings in the White Slave investigation was forced to discontinue after the printing of the first article. This was in the year 1908. The American Jewish Committee, to whose influence the Kehillah really owes its existence, came into being in 1906.

The word "Kehillah" has the same meaning as "Kahal," which signifies "community," "assembly" or government. It represents the Jewish form of government in the dispersion. That is to say, since destiny has made the Jews wanderers of the earth, they have organized their own government so that it might function regardless of the governments which the so-called "Gentiles" have set up. In the Babylonian captivity, in Eastern Europe today, the Kahal is the power and protectorate to which the faithful Jew looks for government and justice. The Peace Conference established the Kahal in Poland and Rumania. The Kahal itself is establishing its courts in the city of New York. The Kahal issues laws, judges legal cases, issues divorces—the Jews who appeal thereto preferring Jewish justice to the justice of the courts of the land. It is, of course, an agreement among themselves to be so governed; just as citizenship in the United States assumes an agreement to be governed by institutions provided for that purpose.

The New York Kehillah is the largest and most powerful union of Jews in the world. The center of Jewish world power has been transferred to that city. That is the meaning of the heavy migration of Jews all over the world toward New York. It is to them what Rome is to the devout Catholic and what Mecca is to the Mohammedan. And by that same token, immigrant Jews are more freely admitted to the United States than they are to Palestine.

The Kehillah is a perfect answer to the statement that the Jews are so divided among themselves as to render a concert of action impossible. That is one of the statements made for Gentile consumption, that the Jews are hopelessly divided among themselves. Hundreds of thousands of Americans have had opportunity during recent weeks to see and hear for themselves that when an anti-Gentile purpose is in view, Jews of all classes make the same threats and the same boasts. They are either going to "get" somebody, or they have "got" somebody.

An Alliance Defensive and Offensive

A RECENT Jewish writer attempted to raise a laugh about the very idea of the members of the Jewish needle-workers' unions of New York having anything in common with the needle-work bosses. He made his attempt in confidence that the public knew little or nothing about the Kehillah. But the public can find all groups and all interests in that body, for there they meet as Jews. The capitalist and the Bolshevik, the rabbi and the union leader, the strikers and the employers struck against, are all united under the flag of Judah. Touch the conservative capitalist who is a Jew, and the red anarchist who is also a Jew will spring to his defense. It may be that sometimes they love each other less, but altogether they hate the non-Jew more, and that is their common bond.

The Kehillah is an alliance, more offensive than defensive, against the "Gentiles." The majority of the membership of the New York Kehillah is of an extremely radical character, those seething hundreds of thousands who carefully organized on the East Side the government which was to take over the Russian Empire, even choosing in the Jewish Quarter of New York the Jew who was to succeed the Czar—and yet, in spite of this character of membership, it is officered by Jews whose names stand high in government, judiciary, the law and banking.

It is a strange and really magnificent spectacle which the Kehillah presents, of a people of one racial origin, with a vivid belief in itself and its future, disregarding its open differences, to combine privately in a powerful organization for the racial, material and religious advancement of its own race to the exclusion of all others.

The Kehillah has mapped New York just as the American Jewish Committee has mapped the United States. The city of New York is divided into 18 Kehillah districts which comprise a total of 100 Kehillah neighborhoods, in accordance with the population. The Kehillah District Boards administer Kehillah affairs in their respective districts in accordance with the policy and rules laid down by the central governing body.

"American Interests vs. Jewish Interests"

PRACTICALLY every Jew in New York belongs to one or more lodges, secret societies, unions, orders, committees or federations. The list is a prodigious one. The purposes interlace and the methods dovetail in such a manner as to bring every phase of New York life not only under the watchful eye, but under the swift and powerful action of experienced compulsion upon public affairs.

At the meeting which organized the Kehillah a number of sentiments were expressed which are worthy of consideration today. Judah L. Magnes, then rabbi of Temple Emanu-El, chairman of the meeting, set forth the plan.

"A central organization like that of the Jewish Community of New York City is necessary to create a Jewish public opinion," he said.

Rabbi Asher was loudly applauded when he said:

"American interests are one, Jewish interests are another thing."

The delegates at this meeting represented 222 Jewish societies, as follows: 74 synagogues, 18 charitable societies, 42 mutual benefit societies, 40 lodges, 12 educational societies, 9 communal federations, 9 literary and musical societies, 9 Zionist societies and 9 religious societies.

At a meeting somewhat more than a year later the number of organizations under the jurisdiction of the Kehillah aggregated 688. These included 238 constituent organizations, 133 congregations, 58 lodges, 44 educational and benevolent societies, and 3 federations. These three federations were made up of 450 societies.

The affiliation now numbers more than 1,000 organizations.

The Kehillah has produced a map of New York City on which the varying densities of the Jewish population are represented by varying densities of shade. In order to comprehend the power of the Kehillah, the Jewish population of New York must be considered. Three years ago, according to Jewish figures (there are no others) there were 1,500,000 Jews in the City alone. Since that time the number has considerably increased—even the Government of the United States cannot say how much.

In 1917-18 the Jews resident in the five boroughs of New York City were estimated—again by Jewish officials—as follows:

Manhattan, 696,000; Brooklyn, 568,000; Bronx, 211,000; Queens, 23,000; Richmond, 5,000; making a total of 1,503,000.

The Kehillah districts form distinct and segregated parts of the City's population, and are 18 in number. These 18 in turn comprise 100 neighborhoods, or little ghettos. The districts, with the number of neighborhoods in each, are represented in the following table:

No. 1. North Bronx District	7	neighborhoods
No. 2. South Bronx District	7	"
No. 3. West Side and Harlem Dist.	7	"
No. 4. East Harlem District	7	"
No. 5. Yorkville District	5	"
No. 6. Central Manhattan District	4	"
No. 7. Tompkins Square District	6	"
No. 8. Delancey District	8	"
No. 9. East Broadway District	8	"
No. 10. Williamsburg District	7	"
No. 11. Bushwick District	6	"
No. 12. Central Brooklyn District	6	"
No. 13. Brownsville District	6	"
No. 14. East New York District	7	"
No. 15. Borough Park District	6	"
No. 16. West Queens District	1	"
No. 17. East Queens District	1	"
No. 18. Richmond District	1	"

Districts such as the Delancey Street and East Broadway sections cover the Great Ghetto of the East Side, while the West Side and Harlem Districts represent the neighborhoods which are the residential goals of the prosperous Jews of New York.

Terrible Human Density of N. Y. Ghetto

IT HAS been stated that there are districts in which the density of Jewish population is more than 300,000 per square mile, which is more than 2,150 to the usual square city block. There are 19 neighborhoods in which the density is more than 200,000 to the square mile (1,430 to the square block); and 36 neighborhoods in which the density is more than 100,000 to the square mile (715 to the square block).

The average density of the general population for New York City both Jewish and non-Jewish, in 1915, was about 16,000 to the square mile, or 107 to the square block. More than one-third of the Jews, about 38 per cent, that is 570,000 Jews, live on one per cent of the area of New York. If all New York's population were as dense as is the Jewish population of the congested districts, the City would have almost as many inhabitants as the whole United States, or about 95,000,000.

These figures dimly portray the overcrowding which has resulted from the terrific influx of Russian-Polish Jews of the ghetto type, who have settled in the Metropolis and steadfastly refused to go any farther, resulting in problems which are probably unparalleled in the history of civilization.

Yet it is out of such conditions that the far-reaching power of the Kehillah is derived.

When the aggressive program of the Kehillah to make New York a Jewish city, and through New York the United States a Jewish country, was announced, some of the more conservative Jews of New York were timorous. They did not expect that the American people would stand for it. They thought the Amer-

ican people would immediately understand what was afoot and oppose it. There were others who doubted whether the same Kehillah authority could here be wielded over the Jews as was wielded in the old country ghettos. As an official of the Kehillah wrote:

"There were those who doubted the ultimate success of this new venture in Jewish organization. They based their lack of belief on the fact that no governmental authority could possibly be secured; in other words, that the Kehillah of New York could not hope to wield the same power, based on governmental coercion, as the Kehillahs of the Old World."

There is much in that paragraph to indicate the status of the Kehillah in Jewish life. Add to this the fact that the vast majority of adult Jews in New York lived under the Kehillahs of the Old World, whose power was based on coercion, and you have an interesting situation.

When Americans Failed to Protest

WHAT the doubt consisted in, however, is not as stated there. No doubt existed as to what it would be possible to do with the Jews. The entire doubt consisted in how far the Americans would let the thing go on. The program of the Kehillah was ostensibly "to assert Jewish rights." No Jewish rights have ever been interfered with in America. The expression is a euphemism for a campaign to interfere with non-Jewish rights.

Just how the free exercise of American rights by an American may be construed and is construed by the Jew to be an interference with his rights, will be shown in a separate article.

The doubters felt that when the Jews began to make such demands as that Christmas carols should be suppressed in the schools, as "offensive to the Jews"; and that Christmas trees should be banished from police stations in poor neighborhoods as "offensive to the Jews"; and that the Easter holidays should be abolished, as "offensive to the Jews"; and that the phrase, "a Christian gentleman" should be protested everywhere, as "offensive to the Jews";—the business class of Jews felt that the American would not stand for it.

The American has never interfered with any man's religious observances; would he stand to have his own prohibited in his own institutions and in his own country?

However, the Jews' misgivings were not justified. The Americans made no protest. The Kehillah went ahead with its campaign, and the native population submitted. New York is Jewish. From the City Hall to the Bowery, from Fifth Avenue to Hester street, in board of education, newspaper row, and courts of justice, New York is Jewish. It is actually an offense, an offense speedily though unofficially punished, to intimate in any public way that New York may possibly be other than Jewish. New York is the answer to those who ask, "How can a numerically inferior group dictate the terms of life for all the rest?" Go into a New York school, and see. Go into a New York court, and see. Go into a New York newspaper office, and see. Stand anywhere in New York, and see.

But with it all one gets a sense of the insecurity of this usurpation of power. It doesn't belong to those who have seized it; it doesn't belong either by right of numbers, or by right of superior ability, or yet by right of a better use made of the power thus taken. They have taken it by audacity; they have taken it in such a way as to make resentment of it seem like an anti-racial movement—and that is why they have held it as long as they have.

That is the only way to explain the meekness of the American in this matter, and it also accounts for the sense of insecurity which even the Jews feel in the position they hold. The American is the slowest person in the world to act on any line that savors of racial or religious prejudice. Even when his justifiable act is taken without the slightest prejudice, he is extremely sensitive even to the charge that he is prejudiced. This makes for a seeming aloofness from matters like the Jewish Question. This also leads men to sign protests against "anti-Semitism" which are really designed to be protests against the publication of Jewish facts.

But it would be a serious mistake to believe that the Americans have accepted within their minds the fact of Jewish supremacy in any field, for they have not. And the Jews know that they have not. Present Jewish importance in American affairs threatens to become as precarious as Bolshevik rule in Russia; it may fall at any time. The Jews have overplayed their hand. They have threatened too wildly and boasted too loudly. The very weight of the importance of the Kehillah and the American Jewish Committee is to be one of the factors in the fall. The Jews may live among us, but they may not live upon us.

These things are better known to the Jew than to the non-Jew, for the Jew knows the Jewish Question better than anyone else, and he knows better than any Gentile when a statement hits the bull's-eye of the truth. The American Jews are not now protesting against lies; they would welcome lies against themselves; they are roused to protest by the power of the truth, and they are the best judges of the truth with reference to themselves.

The situation is not one that calls for expulsion, or resistance, but simply exposure to the light—for to vanquish darkness, what is better than light?

The Jews had a great opportunity in the New York Kehillah. They had an opportunity to say to the world, "This is what the Jew can do for a city when he is given freedom to work." They have the city government, the police department, the health department, the school board, the newspapers, the judiciary, financiers—every element of power.

And what have they to show for all this? The answer is,—New York.

New York is an object lesson set in the sight of the whole world, as to what the Jew can do and will do when he exalts himself to the seat of rule. It is inconceivable that even the Jewish spokesmen will defend Jewish New York.

Is Jewry "Torn by Dissension"?

LEST the New York Kehillah—in view of statements yet to be made concerning it—should be disregarded, or its importance minimized, by the feeling that, after all, it only represents the more radical elements, "the apostate Jews" which seems to be a recent favorite designation for them, a partial view is here given of its leaders.

Present at the 1918 convention were Jacob H. Schiff, banker; Louis Marshall, lawyer, president of the American Jewish Committee and frequent visitor to Washington; Otto A. Rosalsky, judge of the General Sessions Court, who has taken part in several affairs of interest both to Jews and Gentiles; Adolph S. Ochs, proprietor of the New York *Times;* Otto H. Kahn, of the banking house of Kuhn, Loeb & Company—AND—Benjamin Schlesinger, who is lately returned from Moscow where he had a conference with Lenin; Joseph Schlossberg, general secretary of the Amalgamated Clothing Workers of America, with 177,000 members; Max Pine, also recently a consultant with the Bolshevik rulers of Russia; David Pinski; Joseph Barondess, labor leader.

The high and the low are here; Judge Mack, who headed the War Risk Insurance Bureau of the United States Government, and the little leader of the reddest group in the East End—they all meet in the Kehillah, as Jews.

As to the Kehillah being officially representative, it may be added that the Kehillah has in it representatives of the Central Conference of American rabbis, Eastern Council of Reform rabbis, Independent Order of B'nai B'rith, Independent Order of B'rith Sholom, Independent Order Free Sons of Israel, Independent Order B'rith Abraham, Federation of American Zionists—orthodox Jews, reform Jews, "apostate Jews," Zionist Jews, Americanized Jews, rich Jews, poor Jews, law-abiding Jews and red revolutionary Jews—Adolph Ochs of the great New York *Times,* together with the most feverish scribbler on a Yiddish weekly that calls for blood and violence—Jacob Schiff who was a devoutly religious Jew of strong faith and obedience, and Otto H. Kahn, of the same banking house, who professes another religion—all of them, of all classes, bound together in that solidarity which has been achieved by no other people so perfectly as by Judah.

And these are banded together for the purpose of "protecting Jewish rights." From what? If Americans were not large in their liberal-mindedness the very statement of purpose would be an offense. Who in this country is interfering with anyone's rights? The American wants to know, for that is the kind of thing he wants to put down, and always has put down, and will put down again wherever or from whatever quarter it arises. Therefore it will occur to him sooner or later to demand particulars of these rights that need protection, and from what they need to be protected.

Who Will Define "Jewish Rights"?

WHAT rights have Americans that Jews in America do not possess? Against whom are the Jews organized, and against what?

What basis is there for the cry of "persecution"? None whatever, except the Jews' own consciousness that the course they are pursuing is due for a check. The Jews always know that. They are not in the stream of the world, and every little while the world finds out what Judah always knows.

Rabbi Elias L. Solomon has been quoted as saying:

"There is no thinking Jew outside of America whose eyes are not turned toward this country. The freedom enjoyed by the Jews in America is not the outcome of emancipation purchased at the cost of national suicide, but the natural product of American civilization."

Of course. Then where is the "protection" needed? What are the "rights" which the Kehillahs of this country are organized to "defend"? What are the meanings of these committees in every city and town of the land, spying upon American activities and bringing protests to bear to keep those activities within well-defined channels acceptable to the Jews?

These questions have never been answered by the Jewish spokesmen. Let them prepare a Bill of Rights, as they conceive their rights to be. Let them name every right they desire and claim. They have never done so. Why? Because the rights they dare name in public are such as they already possess in abundance, and further, because the rights that in their hearts they most desire are such that they cannot state to the American public.

A Jewish Bill of Rights, such as could be published, would be met by the American people thus: "Why, you have all these things already. What more do you want?" And that is the question which lies at the core of the entire Jewish Problem—What more do they want?

A further penetration of Kelillah activities may help to answer that question.

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

Signing himself "A Jew From Missouri," a writer in the Chicago *Daily Forward,* a Jewish paper, describes Jewish life at the University of Michigan. Inquiring whether there was any animosity shown toward Jews by the other students, the reply was, "Not noticeably."

Mrs. Wurm, Socialist member of the German Reichstag, speaking in favor of permitting Jews en route for America to pass through Germany, excused the status of most of the immigrants by saying that they were deserters from the Polish Army.

Jewish immigration to Germany from the Balkans continues in a flood, and in certain German cities the Judaized municipal government compels citizens to take their quota of immigrants into their home. German workmen complain that Jews are taking all the habitable houses.

Matches in Soviet Russia cost 250 rubles a box. Why rubles? Under the Bolshevik system money was to be abolished. But the scarcity of matches cannot be explained, except that the Bolshevik system appears to have abolished work too. The suffering of the Russian people, at the hands of 625,000 Communists is another answer to the question, "Why should we fear a people so numerically inferior?"

The following lines from the *Jewish Daily News,* of New York, indicate Jewry's reaction to the recent appointment of a Jew to be British viceroy of India:

The King speaks, with the scepter in his hand:
"Go now, my Vice-King to the Buddhist land.
Three hundred million people rule, as long before
The son of Jacob ruled on Nile-stream's shore.

"To India, of my crown the choicest gem
Bring labor, peace and blessing, telling them:
'Hatred nor murder win, but kind retort'—
These are my orders. Go, my Jewish Lord!"

Jacob H. Rubin testifying before a Senate Committee about his experiences in Russia, said that he had met Emma Goldman. "I asked her, 'How about free speech here?' She said, 'Forget it.' Then I asked her, 'How do you like Russia?' And she told me to influence her friends to get her back to the States and she would be a good little girl."

B. Rosman, writing in a Jewish paper under the head of "Jewish Interests," says that among the trades existing in the world, there are some which can only be successfully handled by a Jew, a statement which is illustrated by a Galician Jew who during his residence in the United States has made a business of serving divorce papers. This Jew has recently arrived in Galicia with a pile of divorce decrees which Galician husbands resident in America have sent him to deliver to their wives in Galicia. This is "the writing of divorcement" which is so easily done among certain groups of Jews. His method of carrying on the business is very tactful. Arriving in the town where the all unsuspicious wife lives, he sends her word that he has a letter for her from her husband. She hastens to him and he hands her the paper—very simply done. No Jewish wife is counted divorced until she accepts the document with her own hands. The newspapers in Galicia contain warnings about this Jew from America who carries "letters."

Speaking of the Beth Din, that is, the special Jewish courts, which have already made their appearance in New York, a writer in the *Jewish Daily News* says: "It is better to go before the Beth Din and lose a case, than to go before a regular court and win it."

Struggles of the Man Who Tamed Rubber

By H. O. BISHOP

IT IS not always a good idea to try to break a person of the habit of gesticulating with his hands while talking. It may possibly prevent him from accomplishing something worth while later on in his career.

The secret of the process of manufacturing rubber commercially was accidentally discovered by Charles Goodyear as a result of a handful of rubber and sulphur bouncing out of his hand into an open stove while he was excitedly conversing with his hands as well as his voice.

This unique discovery, which has since proved to be a blessing of international importance to all mankind, came along after Goodyear had gone through many years of heart-breaking struggles, dire poverty, ridicule and even imprisonment.

CHARLES GOODYEAR

Thousands of experiments had been made by this persistent man in his endeavors to tame rubber and convert it from its raw state of natural stickiness into pliable material that would not be affected by heat or cold. Many times when he thought the problem was solved, he soon discovered his manufactured articles would decompose during the summer and become as hard as concrete in winter. He had long known that sulphur satisfactorily cured the surface of rubber, but it was not until that animated conversation in his kitchen one evening after supper that he discovered that heat applied to rubber and sulphur was all that was needed to make it a commercial article useful to human beings the world over.

Mr. Goodyear was born at New Haven, Connecticut, in 1800 and lived until 1860. For 15 years prior to the granting of his patent in 1844 he labored day and night to learn the secret necessary to make rubber useful.

In his boyhood days he wanted to be a preacher but his father was too poor to send him to college, whereupon he embarked in the hardware business, eventually experiencing financial failure and landing in a debtors' prison. Later on he served a number of terms in prison on account of debts, but it apparently never feazed him in his grim determination to succeed. Many of his most interesting rubber experiments were cheerfully carried on while sitting on the edge of his bunk in his narrow prison cell. Between bakings, Mrs. Goodyear would carry her rolling pin to the prison for her husband to use in rolling out rubber while experimenting.

The progress of his invention was constantly delayed and hampered by poverty. On one occasion he wanted to go from Staten Island to New York to procure some necessary material, but did not possess the requisite funds to pay the ferryman, who, by the way, was Commodore Vanderbilt, who later became the builder and owner of the New York Central Railroad and one of America's wealthiest men. The fact that he was penniless and that there was six miles of water between him and his destination didn't worry Goodyear. He merely smiled good-naturedly and suggested the pawning of his umbrella to Mr. Vanderbilt for the price of a ferry ticket. Being a thrifty soul, Mr. Vanderbilt promptly closed the deal.

On one occasion it became necessary to auction off his childrens' schoolbooks to get a little money to keep his family from starvation.

At another time he hocked the family furniture, and put up linen, spun by his wife, as security for board for his family.

No sooner had Goodyear commenced to reap the financial benefits of his great invention than others tried to prove prior claim and steal his laurels. Daniel Webster represented him in these celebrated court trials. In addressing the jury, Mr. Webster said: "Is Charles Goodyear the discoverer of this invention of vulcanized rubber? Is there a man in the world who found out that fact before Charles Goodyear? Who is he? Where is he? On what continent does he live? Who has heard of him? What books treat of him? What man, among all men on earth, has seen him, known him, named him? I say that there is not in the world a human being that can stand up and say that it is his invention, except the man who is sitting at that table. I believe that the man who sits at that table—Charles Goodyear—is to go down to posterity, in the history of the arts in this country, in that great class of inventors, at the head of which stands Robert Fulton."

The contest was decided in favor of Goodyear.

The Romance of the Amethyst

ONCE a rarity, the amethyst is now comparatively common. More than a century ago it reached its zenith in value and popularity. At that time an English princess possessed a magnificent necklace of almost perfect stones which cost two thousand guineas, or a little more than ten thousand dollars. Today this royal piece could be duplicated by the expenditure of approximately a tenth of the original amount.

Scientists define the amthyst as a clear purple or bluish violet variety of crystallized quartz. In hardness it ranks below the diamond in the proportion of nine to ten. Though it resists acids it can be cut with a file and its color can be dulled by the application of heat. The stone apparently tries to hide from the eyes of man; for if it does not lie within the covers of a bed of granite, it will have as its cloister a hollow rock ball technically known as a geode.

The word, amethyst, is of Greek derivation. Literally it means "without drunkenness." The ancients, frequent users of the wine cup, preferred cups made from the stone, as they not only believed in its insurance against intoxication but also in its power to render inactive any poison it might chance to hold. The gem thus bestowed tranquillity of mind upon its owner, for in that age the visitation of death through the agency of secretly-administered drugs was not an uncommon occurrence.

Aristotle, the philosopher, thought that the amethyst would "hinder the ascension of vapors." Baccio, an Italian painter, testified to its efficacy as a resistant of poisons, and further asserted that the jewel sharpened the wits but breeded sleeplessness.

The pious crusaders who fought to gain the Holy Land for Christendom, wore amethysts to preserve them from harm. Thus used as an amulet it soon acquired the title of "the soldier's stone." The people of that period considered the gem a symbol of pure love or sincerity, employed it to express mourning, and wore it when bearing petitions to the overlords. They also believed it capable of preventing the descent of hailstones and locusts.

The Bible contains references to this precious stone. According to "Revelations" the foundations of the walls of the New Jerusalem were exquisitely adorned; the first course was jasper, and the twelfth showed the violet of the beautiful amethyst. On the high priest's breastplate the gem held the third position in the third row.

Edward, the Confessor, highly prized a ring set with an amethyst of the finest quality. This precious stone now adorns the British Crown. Its legendary lore clings to it still, for it bears a reputed value as a protector against contagious diseases.

Cleopatra, the scheming sorceress of the Nile, admired the purple brilliant. She had a signet ring of the stone engraved with a Persian symbol of divinity and light and life. Antipater, the poet, pronounced "the engraving truly of a skillful hand."

Probably the best bit of portraiture done on any jewel is that of the head of Mithridates, the ancient king of Pontus. This deep violet image was discovered many years ago in India.

The largest sculptured or carved work with an amethyst as the medium consists of the bust of Trajan, the Roman emperor. This adornment, formerly in the possession of the Prussian court, mysteriously disappeared when Napoleon occupied the city of Berlin. Historians allege that some of his generals had taking ways. The work of art has been lost to the world since the time of this invasion by "The Little Corporal."

The favorite gem of the American poet, Henry Wadsworth Longfellow, was an amethyst of the deepest shade of purple which, upon being exhibited in artificial light, glowed like a ruby.

St. Valentine wore a ring, so it is said, with Cupid engraved upon the amethyst set. Very appropriate, indeed! Perhaps both St. Valentine and the poet were partial to the gem because each was born in the month of February for which it is the birthstone.

Are you a February child brought into the world under the zodiac sign of Aries? If you are not averse to a little romanticism and wish to play safe, you might invest in amethyst insurance; there are no monthly or annual payments beyond the first cost, and sometimes a sweetheart gladly bears that. Some verse writer put the idea in a nutshell when he counselled:

The February-born may find
Sincerity and peace of mind,
Freedom from passion and from care,
If she an amethyst will wear.

The Wood Hollow Papers

By ROBERT PAGE LINCOLN

WE HAVE here in this northern part of the country (bridging as it does upon the prairies) what is known as the marsh-hawk, *Circus hudsonius,* identified by some white upon its back often amounting to a distinct patch. The marsh-hawk, so far as I know through extensive study, kills little if any poultry, but along the edges of the swamps it lives in due numbers, killing all the mice that it can locate.

We have in this region the common sparrow-hawk. It is the smallest of the species, a little longer than the bluejay. The sparrow-hawk, duck-hawk and pigeon-hawk belong to the falcon family. Of the three, however, the sparrow-hawk, *Falco sparverius,* is of a distinct value to man as it kills a great number of mice and destroys grasshoppers, beetles and other vermin. It is very readily recognized, tending sometimes to grayish, with a breast that has black spots upon it. You can never fail to recognize it. If you see a hawk a trifle larger than the bluejay you can be sure that is the one. It is not afraid and will at times allow you to approach within twenty or thirty feet before it flies away. The duck-hawk, *Falco peregrinus anatum,* and the pigeon-hawk spend most of their time killing birds, and the pigeon-hawk, *Falco columbarius,* certainly is one of the most persistent and destructive of the song-bird harriers. Any song-bird that comes in its path it will seize, if not catching it by swiftness of wing, then waiting for the opportunity of seizing the bird unawares. It lives almost entirely on song-birds, which is not amazing. Undoubtedly it does kill a few mice when hard up for food, but this is rather the exception to the rule than a common occurrence. In coloration it is bluish and brown above and light on its underparts. The duck-hawk is darkish above and light on its underparts.

But among all the hawks there are two that have very little sympathy with naturalists and which do about as little good as any creature living. I bear mention of the sharp-shinned hawk, *Accipiter velox,* and Cooper's hawk. Of the former it may be said that it kills a great number of song-birds; it is exceedingly keen and alert, every movement expressing determination and a mood that will stop at nothing short of murder. It is rapacious to a degree. The amount of insects, mice and such vermin that this hawk does away with forms a negligible quantity. Cooper's hawk, *Accipiter cooperii,* is another bird-destroyer which looks very much like the sharp-shin in coloration, being bluish-gray on its upperparts and whitish underneath, but unlike the sharp-shin it is larger and possessed of great strength, well fitted for plundering farms and carrying off all sorts of medium and under-sized poultry. Out of 133 stomachs of this variety that we have cut open and examined as to contents, 34 have been found to contain poultry and game birds such as grouse, doves and quail; 52 of these stomachs showed an almost exclusive diet of song-birds while 11 had partaken of small mammals; 1 had a frog in it, and 3 others had fed on lizards, 2 had dined on insects and the remaining 39 were empty. There were 21 species of useful birds represented in the food bill of this hawk as against 4 mice, 1 rat and 1 grasshopper. In this accurate manner is Cooper's hawk unmasked.

If you should see a hawk circling high up in the air in a flight that takes him gradually lower and lower to the earth you may suspect (and not without basis in fact) that it is none other than Cooper's hawk. In these circling operations, exceedingly keen as is their eyesight, they apparently see everything that goes on on the earth below. If they can locate a mother hen with chicks, or a pullet a certain distance from the house they will drop out of the very skies like a bolt of lightning and have their prey before you can count ten! We may suspect that chickens on the ground, however, can see the hawks so high up in the air as clearly as the hawks can see them. The rooster, constantly on watch, sees these circling marauders and by a series of warning chuckles keeps the flock watchful and alert, ever close to some place where cover can be secured.

A query was once addressed to me asking if I thought it a wise thing to suggest the decimation of any hawk. To which I replied that if a bird student, knowing one hawk from another, the good from the bad, did the killing, all well and good but to suggest a wholesale killing by amateurs would work incalculable harm. The time to kill off harmful hawks is during the nesting season, but knowing that they are outlawed, apparently, these birds select the most inaccessible places to shelter their brood. If you would find them in their haunts go to the most wild and tangled woodland that is rarely frequented by man; there you will find them. If then one will station himself in concealment and be on the alert with field glasses he can easily make out the object he is after and plan its destruction.

Hundreds upon thousands of hawks are annually killed in the United States, nine out of ten of which are birds invaluable to the welfare of man. Practically the bulk of the mounted specimens I have seen in my day have been useful hawks, those readily shot; rarely have I seen a destructive hawk on display. Millions upon million of dollars have been expended to protect our crops; further millions will be spent in the future. But no campaign of education of the people into the value of nature's protectors has gone forward. A man once said to me: "How in the world can you be so foolish as to believe that a few hawks can keep a farm rid of vermin?" This attitude is not held by individuals alone, but is a common conviction. As a nation we progress at snail's pace in our knowledge and appreciation of nature study!

Why the Team Goes South

The sliding pit. Here the major leaguers learn the art of eluding the infielder who is waiting to tag them out.

IN THE spring of 1905 the Detroit baseball club was training at Augusta, Georgia. The major leaguers used the Augusta ball park to condition themselves for the season's pennant race and when they started north they owed the Augusta management the sum of $750 for park rent. Since $750 was quite a sum in the balmy spring of 1905 the Detroit manager concocted a bright scheme. He had a little pitcher on his team and he figured this youngster, who weighed less than 140, would never be big enough to pitch in the majors. Major league pitchers should be giants, according to the accepted belief of the majority of managers. So he made the Atlanta club a proposition which offered the use of this pitcher for one season for ground rent. Also, the offer contained a clause that at the end of the season the Detroit club was to have this pitcher back, if Detroit desired him, and if Detroit did not want the pitcher the club was entitled to pick any other man in the Atlanta lineup.

At the end of the season Atlanta was ready to carry out its part of the agreement. The pitcher had done fairly good work but he was still too small for major league use, according to the opinion of the Detroit management. Detroit looked over the remainder of the material and the choice finally rested between a skinny kid outfielder and a likely-looking infielder. After much discussion it was decided to take the outfielder.

You who follow baseball have heard of all three characters in this unusual bargain. The skinny outfielder was Tyrus Raymond Cobb, greatest player of all time. The little pitcher was Eddie Cicotte, who became one of the greatest pitchers in the game, and the infielder was Clyde Engel, who never attained the fame of either Cobb or Cicotte but who also made the major league grade and was a member of the world's championship Boston American League team.

* * *

This is going a roundabout way to reach our subject, spring training of major league teams, but since it is an incident worthy of note it is used as a prelude to this article.

Since 1905 many changes have taken place in baseball and spring training has become a fixed necessity in the minds of the men who govern the business offices of the major league clubs. It is an ordeal for most players and it presents many advantages as well as numerous disadvantages.

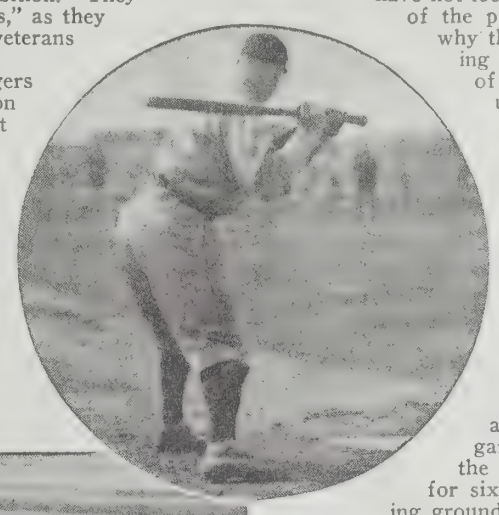
Why a spring training trip? The question is asked by baseball writers annually. But regardless of their opinion on the subject, spring training trips are becoming more elaborate each year and continue to carry the same amount of weight with the managerial persons.

The exodus of the major leaguers to points south of the Mason and Dixon line begins in the middle of February. At this time the pitchers and catchers, commonly called the battery men, start the southward journey. Many of them are first sent to Hot Springs, Arkansas, for two weeks stay while others are sent direct to whatever station has been selected for the spring "grind."

In this preparation of baseball clubs for the major league pennant competition, which lasts through a stretch of 154 games, the club owners spend a vast amount of money. There are eight teams in each big league and each of these teams will have from 35 to 45 men in the South this spring. With the increased rates for railroad passenger travel and high hotel rates, it may be roughly estimated that the major league clubs will spend $200,000 for railroad tickets and $135,000 for food and shelter this spring. Various other expenses will bring the total investment, before a ball is thrown on a major league park, very close to the $500,000 mark. Half a million dollars spent before a turnstile clicks in a big league park!

Against this expenditure there is a revenue from exhibition games but never in the history of baseball has a major league club collected enough money at the gate in exhibition games to pay for its spring training.

But more of this later. What you want to know, and what has never been explained in a detailed way, is the system of conditioning ball players for major league pennant races, as they are called on the sporting pages of the daily press.



As remarked, pitchers and catchers are sent ahead of the infielders and outfielders. Pitchers need more time to limber up. There are several star pitchers that never strike their true stride before the season is well under way, some of them not going at top speed until the middle of June, when the weather has really turned to summer in the major league belt.

The older a pitcher gets the more time it takes to get his arm into pitching condition. The muscles stiffen, the arteries harden and the task becomes more difficult each season. That is why you see so many strange names at the bottom of the batting order in major league box scores and why you often wonder whether some pitcher has been released. He will probably appear just as soon as his arm gets into shape.

A pitcher throws the ball an average of 100 times a game. How much physical energy he needs all depends upon the score. If the score is close he will have to use more energy; if his team is ahead by a fair margin he saves himself by pitching his best only when there are men on bases and when the opposition threatens to score.

Now, in the early spring games, few managers will take a chance on their good pitchers in the cold, heavy atmosphere of the northern climate. They trot out the youngsters whose muscles are still pliable and who have lots of energy and ambition. They are the "cold weather pitchers," as they call them in baseball. The veterans are saved for warm weather.

But major league managers have decided that games won in the spring months count just as heavily in the standings of the teams as games won late in the season and that many games can be rescued by a veteran that will be lost if a youngster is entrusted with the pitching task. Therefore, in recent years, the veteran pitchers have been sent into the balmy South early in February, giving them two full months to work their arms into shape and have them in condition to answer an emergency call in the early days of the league race.

Group of veteran pitchers working out. They toss the ball in early practice.

The veteran catchers are always sent along. If you study your baseball you will probably conclude that this is wrong as the young catchers could get much more benefit out of this work. They need the experience and the veterans do not. Anyway, you know that a catcher does not make more fast throws in any game than the shortstop, for instance, to whom come most of the fielding chances on the infield. But there is a deeper motive in sending the veteran catchers. The manager wants the experienced backstop to guard the pitchers. It makes little difference how many years a pitcher has worked, there is always the danger of his "throwing his arm out." After being in uniform for a few days the pitcher will decide suddenly that the "old super feels fine" and begin opening up. This consists of curving the ball or throwing at top speed. The result has too often been disastrous and many good pitchers have ended their careers prematurely because they felt too frisky and could not restrain the temptation to "put everything behind her." The veteran catchers are sent out to prevent this. It is their duty to keep the pitchers from throwing fast or curve balls. For weeks the pitchers are compelled to "lob" the ball for several hours each day. This becomes irksome and therein lies the danger. As soon as a pitcher begins throwing curve balls or fast ones, after becoming tired of the monotonous task of tossing, he is ordered to quit for the day and to top off his labors he has to run one or two miles to remove surplus weight and get his wind into condition for the season's work.

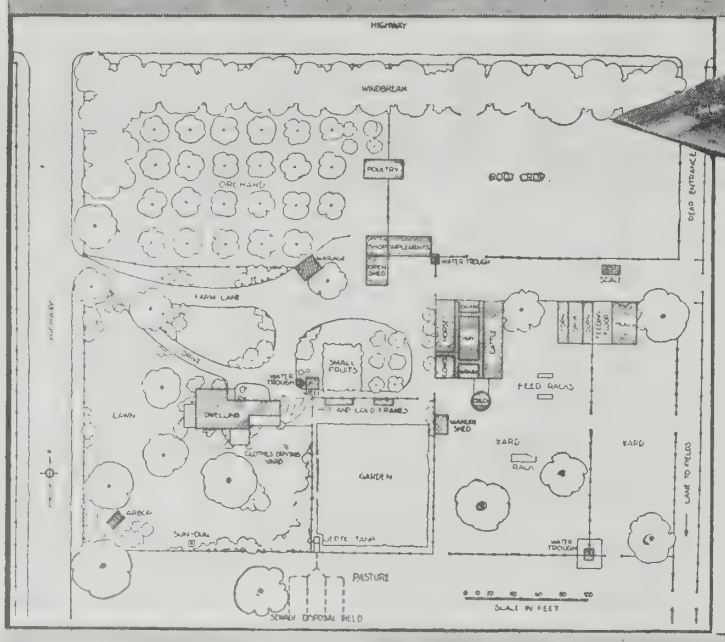
By the time the regulars and recruits, infielders and outfielders, arrive in camp during the first or second week of March, the pitchers have been conditioned enough to throw with moderate speed. They continue their daily tossing but also each of them works for a brief period pitching to batters. Since these batters have not looked at a pitched ball since the close of the previous season it is quite apparent why the pitcher is prevented from throwing at top speed, using a curve or one of the freak deliveries which can be used only by veteran pitchers now. The job of the pitcher is to give the batter an opportunity to "get his eye on the ball," in other words, to follow a pitched ball.

Batting is not all the infielders and outfielders do. Their work is as tiresome as that of the pitchers and catchers.

It is very amusing to watch some of our crack major league outfielders going after their first fly ball in the spring. They will misjudge more in one day than in an entire season of 154 scheduled games. The eye has to be trained to the flying ball and this takes time. So, for six days, the infielders continue fielding ground-hit balls and the outfielders chase fly balls. Then begins the more serious work of infielding. The manager chooses groups of four, first baseman, second baseman, third baseman and shortstop. Also, there is always the catcher. The four infielders are used in order, each receiving a ground-hit ball and his part of the exercises consists in fielding the ball and throwing.

There is a great deal in the manner of a fielder. The manager after a few days knows just where the man's weakness is in fielding. He may be weak in going to the left, or to the right. He may be weak on foul balls, or on what is known as Texas Leaguers, balls hit between the infield and outfield zones of occupation. He may be weak in his judgment of a ground hit ball in that he does not know when to come in and when to step back to field the ball. Or his throw may be his weakness. Some players take an extra step to get more propelling power and some take even two steps. Many infielders cannot throw unless they balance themselves and take full aim, where the ideal infielder will scoop up a ball and throw with practically the same motion.

Each day the recruits, all of them, are asked to bat. Here again the critical eye of the manager notices the faults in style. Some are natural hitters, others artificial. The natural or straightaway hitters, are the most desirable while the batters with makeshift style are uncertain. This is a lax rule with many exceptions, for a great coach once remarked that most of the "greats" in athletics of any kind lack perfect form. There was never a more awkward-looking ball player than the great Honus Wagner, never a more graceful player than Napoleon Lajoie. Both achieved fame and greatness. If a man is successful in doing a thing in a certain way it is best to let well enough alone no matter how contradictory to proper form it may be. Many people have many different ways of arriving at the same goal.



However, there are some faults which not alone are bad form but which can never be utilized to any advantage and these are the faults that the manager tries to correct. Sometimes he succeeds.

In one corner of the playing lot the trainer and his assistants have dug a pit. This is filled with sand, or soft earth and is called the sliding pit. All players, as a rule, are compelled to take sliding exercises. At the end of the pit a bag has been fastened and the players are taught to do the hook slide, the fadeaway, or any other slide to which they can adapt themselves. It all depends upon the player. As a rule the sliding lessons are part of both morning and afternoon exercises after the first week in camp. Sometimes they start a little later for much depends upon weather and physical condition.

Each major league team carries a trainer, whose duty it is to look after the physical welfare of the players. Gallons of liniment are used in major league camps each spring. The pitchers, after each workout draw first attention. Their arms are rubbed with lini-

(Concluded on page 12)

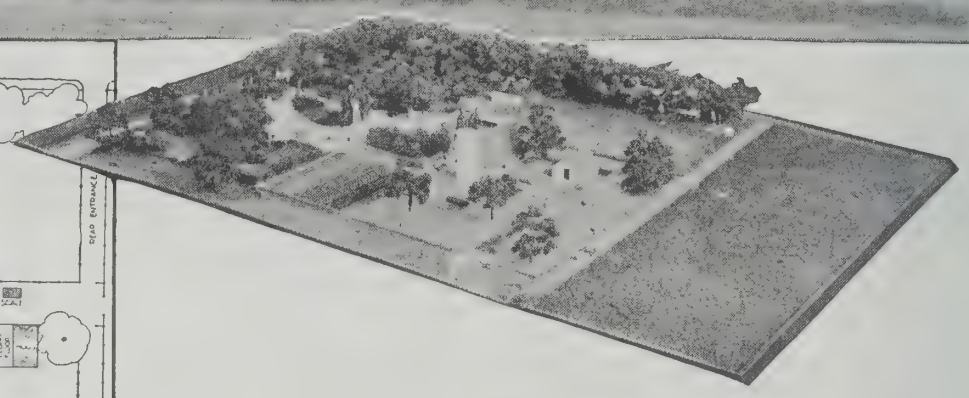


Diagram of the model homestead designed by specialists in the United States Department of Agriculture. This arrangement presumes a location east of a highway. The same general scheme is applicable to locations facing the highway from other directions, but the arrangement should be changed in some matters of detail, especially the orientation of buildings. The model, of course, isn't suited to all conditions but combines the principles the department experts advocate. The subject is covered fully in Farmers' Bulletin 1132, entitled "Planning the Homestead" which may be secured free from the United States Department of Agriculture. Other advice can be procured from the rural engineering division of the department. At the top is a front view of the Department of Agriculture's model homestead. At the right is shown the back view of model homestead designed by the rural engineering division of the United States Department of Agriculture. Below is the side view of the model homestead.

THIS is the first of a series of articles on the farmstead, as written by Mr. Ulm for The Dearborn Independent. The facts contained in each article may be accepted as authoritative in all instances, having been obtained from officials of the Department of Agriculture or the records of that department.

There has been much discussion of the various phases of farm life and farm management but seldom has the public been given the opportunity to read of the various problems as concisely yet comprehensively as here presented.

It is suggested that each story, and there are six, be followed closely by those who are interested in such things. The illustrations provided are profuse and appropriate. In this edition, for instance, there is a diagram, together with splendid photographs, of the model farm as worked out by the Department of Agriculture.

The Farmstead—Its Possibilities

By AARON HARDY ULM

THE inexperienced beginner in farming here in America may find guiding standards for virtually everything except the farmstead, probably most important of all.

"The pioneering stage in human housing is prolonged beyond the pioneering stage in animal and crop housing," says Professor C. J. Galpin, economist in charge of rural life studies for the United States Department of Agriculture. "The modern farmhouse follows at some distance the modern dairy barn."

The problem of proper housing on the farm involves a great deal more than the erection of a suitable dwelling or the construction of a barn designed for efficiency. The dwelling bears an important relation to the farthest corner of the farthest field in the entire farm. Even the side of the road upon which it is situated, its orientation with regard to the points of the compass, and its position with reference to other items of the farmstead organization are of exceedingly high importance, say Uncle Sam's rural engineers.

It is probable that the most elegant type of farmstead, that represented by the extravagant "country place" of the wealthy banker or business man who believes that he can show practical farmers how to farm, is the most misleading. Whatever the costly engineering and decorative skill presented by them, they nearly always involve investments that are beyond the earning power of farming lands. Hence they are uneconomic.

The worst ones are the other extremes, a group of buildings thrown up merely to afford the human beings and the live stock protection against the elements. Whatever the apparent economies made in the beginning, such a place in the long run is invariably less profitable than the one carefully planned.

The farmstead, say rural engineers, need not be an expression of wealth or the lack thereof. Of course if all the desirable appurtenances are included, the establishment necessarily involves the spending of money as well as care and energy. But the farmstead of the humble two or three-horse farmer can present a model of livableness just as well as a lack of order and proportion, as many of them do.

"If the average farmer were told that at some time during the year he would find it necessary to take a trip of 150 to 200 miles on foot carrying food, milk, or harness he would object strenuously, and say that under no circumstances could he spare the time," says the Department of Agriculture. "Yet hundreds of farmers are taking the equivalent of such trips every year because of the unnecessary steps which result from a poor arrangement of farm buildings."

And the most convenient arrangement of buildings as well as the most healthful and economic arrangement of the entire farmstead means the better-appearing farm place.

The Department of Agriculture is doing much to promote better farmsteads. If its suggestions were carried out by all farmers for a few years our national landscape would be adorned uniformly by good looking as well as efficient farm places, instead of presenting the spotted appearance that now often makes us wonder if farm places are homes or just make-shift habitats.

The work, of course, begins with the laying out of the farm and the planning of the homestead from the ground up. Working plans have been developed and actual models of homesteads suitable to differing conditions have been made, and all the data are available to any farmer in the country.

Offhand one might think it easy, for example, to select a site on a given acreage for the farm home and its environs. But it is quite a complex matter. Even with all other factors equal, the question of whether a farmstead should be on a public road is not easily answered. If it is a small farm beside a good road, it may be best to have the farmstead near the road, as then it has superior social contact with the outside world. But if it is a large farm, it may be better to locate the farmstead away from the road, to save time in going from it to different parts of the farm establishment; for the distance between the dwelling and barn and the field to be worked may be an important factor in farming economy.

"The farmer who desires to obtain the greatest possible results from his operations, whether he be already established or just entering upon his venture, may profit by the example of some of our industrial establishments, where, to reduce cost of production, or to increase the output, whole plants have been remodeled or entirely new plants erected, all carefully arranged to meet the particular requirements of the work to be done," says the Department of Agriculture.

"The planning of a farmstead layout involves the arrangement of the various buildings, yards, lots, and so on, with relation each to the other, to the fields and to the highway, in such manner that there shall be a minimum of time consumed, no retracing of steps, and no lost motion in executing the work of the farm.

"Pleasing architectural effects, tempered with economy in materials and construction, should be sought in the designing of the buildings, such as barns, stables and the smaller structures, but the first consideration is that of utility.

"The amount of money invested in a house should be such that the net income of the farm

can easily take care of the interest, if interest must be paid, without too great restriction upon other expenses. Within this limit, the farm home should have all the conveniences and comforts possible, and should be as attractive in design and surroundings as it can be made."

While the specialists in the Department of Agriculture would like to see every American farmstead a model in design and appearance and equipped with every possible item of helpful appurtenances, it realizes that in the matter of expenditures improvements can be overdone. In fact the department is very loath to urge the general adoption of many valuable farm appliances out of fear that they will be taken on by some farmers before they can be made to pay.

A somewhat new point of view is being taken by other branches of departmental effort. It runs counter to the utilitarian motif that underlies most efforts to improve the welfare of agriculture in this country. It represents the esthetic as against the practical school of farm betterment.

That view is held in the main by men like Professor Galpin who directs the rural life studies made by the Office of Farm Management.

"Perhaps the best thing anyone can do for American farming right now," says Professor Galpin, "is to reinvest it with the Homeric spirit and perhaps the place to begin is the home."

While few men of agricultural science take the pessimistic view of farming and rural life that much of what they say would often tend to indicate, Professor Galpin stands out conspicuously as one whose approaches are wholly of optimistic character.

"In my time, farming and rural life have improved wonderfully," says he. "This doesn't mean that much more improvement cannot be attained, but it means that the best way to promote further advances is by recognizing what has been done and treating that as proof of what may be done."

And he is opposed to measuring improvement by mere mechanical or profit-making standards, being inclined to oppose the theory, for example, that the development of the farmstead must be governed wholly by utilitarian requirements.

He is for humanizing the farm home and the farmstead, and this can be done best, he says, by detaching them, as far as practicable, from the working elements of the farm; that is, for instance, the farmhouse should be "de-occupationalized." But the farmhouse and the farmstead are vital parts of the working plant of the farm; hence detachment must be more apparent than real.

"A survey of the attempts of many modern farmers to create a humanizing atmosphere around the farmhouse shows that this effect is accomplished by psychological barriers, screens and inclosures," says he. "The work appliances of the farm are necessarily in such close proximity to the house that exclusion is done by suggestion rather than by actual shutting out of every scintilla of farm work. The low wall, the hedge, the clump of trees, running vines, are mental screens. We can peer over or around but we do not. Roofs and outlines of farm buildings are visible but lost to sense in the competing humanism this side of the barriers."

He points to Mount Vernon as an excellent example of his theory. Visitors to Mount Vernon see Washington's former dwelling as a home and nothing more. To see and appreciate it requires no effort. It dominates the environment so completely that you veritably have to search for the other structures all of which, however, are conveniently arranged with regard to the house. This effect was achieved consciously by Washington who "plays up" his house as a place to live in in all of his writings concerning the development of the place.

"The country life problem as a whole cannot make consistent headway in humanizing and socializing farm life," says Professor Galpin, "so long as the work elements of farming smother the farm home. That farm people get accustomed to the proximity of ever-present occupational things and processes, means only that hardening invades the precincts of the farm mind and soul as it invades the farmhouse. A rural housing social conscience will probably at no distant day transfigure living on the farm and give rural America an air of architectural grace and landart beauty."

"Careful arrangement of the farmstead and intelligent planning of the farm buildings is good business under any circumstances but it is especially important when capital is limited and must be made to go a long way," says the Department of Agriculture in its bulletin dealing in detail with the subject. "When such is the case the farm business plant must be first considered, but the ultimate farm home should be planned for with the rest of the farmstead. Possessed of the plans for an attractive home, the farm family has something toward which to work, an incentive to thrift and economy in the operation of the farm and home life not easily broken."

That farm homes and farmsteads, beautiful, practical and convenient in degrees equal to and in some respects superior to living establishments possible in cities, are available to the American farmer is proven by the numerous examples found in virtually every agricultural community.

It can be shown that virtually every mechanical convenience that adds to the comfort of the average city home can now be made of avail to the rural dweller.

But many things just as vital to happy life as mechanical aids to living are almost exclusively available to the people who live in the country.

"When I came to Washington from my farm in the Middle West," declared a Department of Agriculture specialist, "I sought to get for my living environment some intangible elements I had enjoyed at home. Among these were elevation, light, fresh air, privacy and space. I could procure almost any one of them and often more than one—at a price for each of them. It was veritably impossible to get them all at any price within the bounds of the city; so I now live out in the country. In the country all of those things, which are more important to happy and satisfactory living than an equal number of mechanical conveniences, are available on virtually any farm, and primarily without cost. If the farmer doesn't get them for his home environment, and without paying extra for them, it usually is because he doesn't take advantage of what his environment offers him free."

A good farmstead site is apt to exist on the average farm. Its selection is a matter merely of study. Any farmstead, however small the investment put into equipment, can likewise be developed along attractive and economical lines just as easily as the contrary, provided proper thought is given to it.

And, despite all its shortcomings as compared with what it might be, I find every agricultural specialist that was besought for an opinion inclined to the view that, after all, the average American farm home, and especially its environs, is superior to the average American city home. While not many of the former, as compared with the latter, have running water, electric or gas lighting, or central heating plants, they are roomy and surrounded by certain intangible advantages, such as natural light, fresh air and space, that do not adhere to the city home.

Aside from the practicalities, the development of the farm home has esthetic possibilities far beyond what is available to the city home-builder.

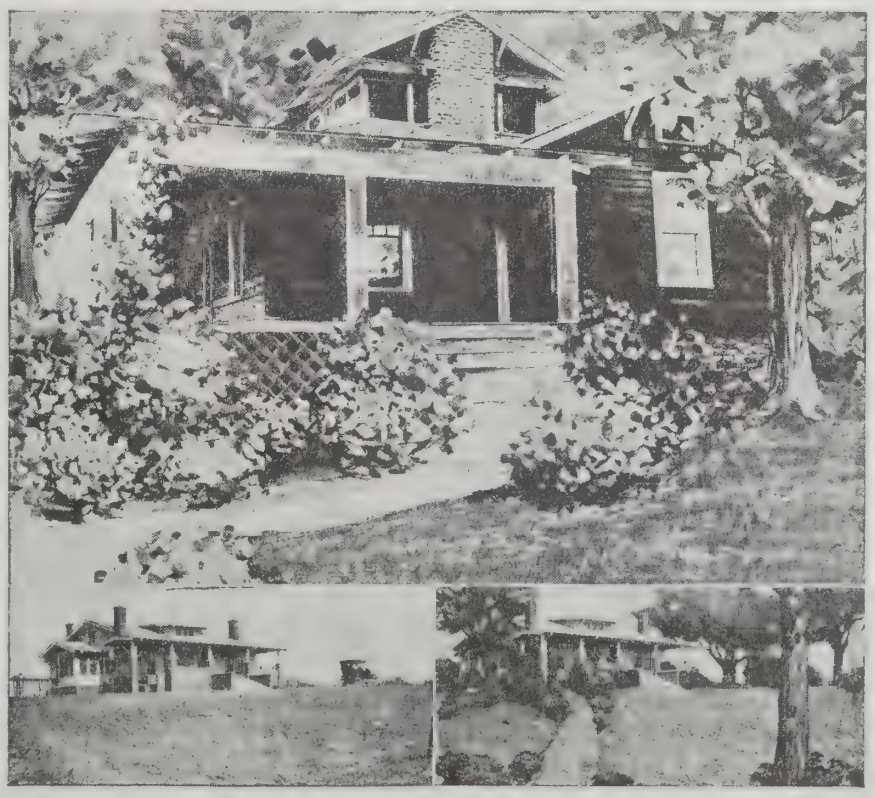
The ambition of Kipling's artist to "splash a ten-league canvas with a brush of camel's hair" can be measurably realized by the beauty-loving home builder in the country.

When F. L. Mulford, expert landscape gardener for the Department of Agriculture, was explaining the carrying out of suggestions put forth in his bulletin, "Beautifying the Farmstead" he was asked about the money cost of beautification.

"The actual money expenditure involved in making the setting of the average farm home a pretty one is not, I should say, more than fifty dollars."

What he meant was the cost of materials and plants and perhaps labor—barring, of course, expert help—which the farm and the farmer can't supply.

"You must remember," said he, "that the greater part of the work has to be done anyway. For example there must be passable walks or roadways leading to the home. To lay them out attractively costs little more than just to let them happen. Even the plant life needed for adorning the surroundings of the farm home, that is, the trees and shrubbery, can be procured in most parts of the country without cost, in great part, from the near-by woods or fields.



"We have little appreciation for the possibilities in much of our native shrubbery. Even the colonial home-builders who saw the value in our native trees, failed in the matter of shrubs. Many of our native shrub plants have been taken over by foreign breeders, popularized, and then sold back to us as high-priced novelties."

One might think, from much of the foregoing, that American farm families are not interested in home beautification. Such is a wrong conclusion.

When the Department of Agriculture issued the bulletin last year dealing with the subject, an edition of 50,000 copies was exhausted within less than a week's time. It is perhaps the most popular bulletin issued by the department in recent years.

What it and the companion bulletins that deal with the practicalities of the farmstead show most clearly is that convenience and attractiveness, as applied to the farmstead, are not incompatible, and that the modest farm home can be developed in both ways as easily as the costly one.

"Before and after" effects that show what properly designed walks and a little shrubbery will do toward beautifying the farm home. And our woods contain excellent native shrubs, and walks are matters of mere taste and a little work.

He Capitalizes Hate

By JOHN B. WALLACE

THERE are many and devious ways of making a living in this world. Eric von Stroheim was, through force of circumstances, compelled to adopt a number of these, foreign though they were to a man of his birth and education. But the strangest means of all and the one through which he has achieved fame and some measure of fortune was discovered by him in 1914 after the outbreak of the World War.

A Prussian neck won for him more money than he had ever been able to earn before in his life. Hate was supposed to be a copyrighted article of the Germans, being taught in fact by the German Government, but von Stroheim found that Americans were not such bad haters if given sufficient provocation. Von Stroheim proceeded to give them the necessary provocation and they responded by hating him most heartily. Did this injure the delicate sensibilities of this ex-lieutenant in the Austrian Army? We opine it did not for the more he was hated the more money he was able to earn. Today, he is a director in one of the largest studios in the motion picture world, drawing a salary that would arouse envy from a bank president and he is still making them hate him.

COUNT ERICH VON STROHEIM

Despite the fact that Von Stroheim is the perfect type of the snobbish Prussian officer, he has not a drop of German blood in his veins. He was born in Vienna of an Austrian family of the lesser Austrian nobility. His real title is Count Erich Oswald Hans Carl Maria Nordenwald von Stroheim. Is it any wonder that a child saddled with a name like that should have a tough time making his way in the world?

Von Stroheim was educated in a military academy in Vienna, taking a post-graduate course at the government war college. In 1902 he was made a second lieutenant in the Fourth Regimental Dragoons. Two years later he was assigned as orderly to Prince Louis de Bourbon, who was serving in the Austrian Army in conformance with the traditional custom in Europe of exchanging officers between countries.

In 1908 Von Stroheim took part in the campaign to annex Bosnia. He was wounded and after being invalided was transferred to the Imperial Palace Guard. It was for his services in this campaign that he was decorated by Emperor Franz Joseph for conspicuous bravery in action. His injuries prevented him from properly discharging his duties in the army so he was permanently retired, soon after this, on a small pension.

Von Stroheim decided to come to America. And then his troubles began. His military education had unfitted him for commercial pursuits and he was hard put to make a living. He worked as a woodsman in the Maine woods, sold fly paper from door to door, in fact did anything that he could obtain to do to keep from starving.

He gradually worked his way across the continent and at one time obtained a job as boatman on Lake Tahoe. As he plied his oars he often thought bitterly of the evenings he had spent with the élite of European society on Lake Lucerne in Switzerland. He little dreamed in those days when he lordly tossed a coin to the boatman that some day he would himself be pocketing tips for the same kind of service.

Von Stroheim had taken a great interest in amateur theatricals while a guardsman in Vienna. After coming to America he wrote a sketch called "Brothers" which was successfully presented on the Orpheum circuit.

His next venture in the theatrical world was in 1914 when D. W. Griffith picked him out of a mob of "extras" to play the part of a German officer. His famous Prussian neck which exemplified to a nicety the arrogance and cruelty of the junker type of army officer was what particularly excited Griffith's attention. The latter's delight may be imagined when he found that von Stroheim had actually been an army officer and a member of the nobility.

Von Stroheim's fortunes in the motion picture game dated from that day. Movie audiences through the stirring times preceding and during the World War hissed and hated him to their heart's content. Von Stroheim, through his perfect characterization of the worst in German militarism, brought home to Americans more forcibly perhaps than any other method the evil with which the world was confronted and he did invaluable work in arousing their patriotic fervor.

When he was not acting in front of the camera the ex-officer was also of great assistance to his directors because of his knowledge of continental customs and military affairs.

Some of the picture plays in which he scored his greatest successes were "Old Heidelberg," "For France," "Heart of Humanity" and "Hearts of the World."

When not acting himself he was often used as assistant director and finally he was given recognition by being made director at one of the largest studios in Hollywood.

Since becoming a director he has filmed three of the most sensational pictures yet thrown upon the screen, "Blind Husbands," "The Devil's Passkey" and "Foolish Wives." Whatever one may think of the theme of these pictures—and personally I crave the ozone—there is no denying their artistry and fidelity to detail.

Von Stroheim not only directs but acts in "Blind Husbands" and "Foolish Wives." And speaking of hate it might further be said that he also draws a fair share of this article from the other directors who work for this company. The reason is not far to seek.

It is customary among the larger studios to make out a schedule of expense for the pictures it is intended to film during a season. Sort of a budget system, as it were.

Since Von Stroheim has been a director, his pictures have far exceeded in expense the original estimate. The last one cost nearly half a million dollars. His system is to get the company so far along with a picture under the original appropriation that they are compelled to maintain the pace or sustain a slump that would ruin the presentation. As most of the money used to complete his productions is subtracted from the appropriations of the other directors it is easy to see why Von Stroheim is not beloved by his co-workers in directing.

But Von Stroheim thrives on hate and his rapidly growing bank account proves that it is rather a remunerative emotion if sold in the right market.

Why the Team Goes South

Concluded from page 11

ment, the muscles massaged and the shoulder behind the pitching arm given particular care.

A major league training camp presents an amusing sight after the second day out. The players limp around and appear a collection of cripples. This is natural when one considers that for five months, these men who engaged in strenuous exercise during the spring, summer and early autumn of the preceding year, have done nothing in the way of physical exercise. Of course, some do, but very few. The first week in camp holds days and nights of physical agony.

In recent years some ball players are making it a point to exercise during the vacation months. Some work in the open, others do gymnasium work. It keeps them in condition and it saves them torture in the springtime.

In athletics, football, rowing, track and various other teams that engage in college competition, are placed on a strict diet. Not so in baseball. No diet is prescribed. And the simple explanation of this is that it would be necessary to keep ball players on a diet for seven months which would mean that they would go stale and become useless. Even football teams with a season of not quite three months, are not on a permanent diet as the rule is broken at least once a week to prevent the athletes from becoming overtrained.

The manager insists that the players retire at 11 p. m. and that they arise at 7:30 a. m.

Major league clubs stay in the southern camp for three or four weeks. In that time several exhibition games will be played, sometimes between picked teams, sometimes with organized teams or the neighborhood, college teams and quite often with teams of the other major league. Then starts the journey north with games scheduled every day, sometimes with minor league clubs and at other times with major league teams.

On this trip the manager reaches semi-final conclusions regarding his new material. This is a ticklish and delicate task for if he lets a man slip by who will later make good, he will be blamed for years to come, while if he keeps one that fails later on the criticism will likewise be severe.

* * *

You have been told exactly what constitutes spring training of a major league ball club and why. This has been the orthodox program for years and will be the program for fifteen major league teams this year. As there are sixteen clubs in the big leagues there must be one exception in 1921 and this is Detroit.

In our preface we told how Detroit secured the world's greatest ball player in lieu of rental on a ball park and now this same player, Tyrus Raymond Cobb is making his debut as a manager. He upset all baseball traditions as a player and he intends to upset all of them as a manager. The Detroit camp this spring will be much unlike any other major league camp is or has ever been. Morning practice will be abolished by Detroit this year, also the sacred 7:30 o'clock call. Cobb has decided that one practice session is far more valuable than two and that thorough rest is of immeasurable benefit to an athlete. Players can sleep as long as they like in the morning—if they are Detroit players.

Cobb says that this plan of holding morning practice is all wrong. The player arises at 7:30 o'clock. He eats a hearty breakfast and before the heavy food has more than started to digest he is engaged in strenuous exercise with the natural result that he does himself physical harm.

The Cobb plan is to hold one long practice session, starting shortly after the noon hour. Everybody will be compelled to hustle all the time but as soon as any player shows signs of fatigue he will be ordered to the clubhouse. This also is in direct obeyance of the rule of every good physician and trainer. All these experts on the human body maintain that over-indulgence in exercise is extremely harmful.

This violation of baseball's ancient and honored customs will make the experiment one of the most interesting in the game's history and it is quite likely that, if successful, all clubs will adopt this method of preparing ball players for the pennant races.

The Barriers of Life

A YOUNG girl who was wilful and wont to commit foolish and indiscreet acts, often complained that her mother was always a barrier in her way of enjoyment.

"If I want to go to an all-night dance with Will," she said, "or on a moonlight excursion with Earl, or an auto ride with that young man I struck up an acquaintance with the other day, you always stand in my way; always find some excuse for not letting me go. You are always putting up the bars. You are a barrier, that's what you are, mother, a barrier!"

The patient mother quietly turned to the dictionary and, after finding the place, called her daughter to look at the book.

"This is what Webster says. Listen:

"*Barrier:*—A fence or other obstacle, made in a passage or way, to stop an enemy."

Then turning to the girl the mother said: "I hope, my dear, I shall always be that kind of a barrier—'an obstacle to stop an enemy.'" In after years the girl was thankful that she had such a barrier as her mother to keep her and the enemy apart.

In all departments of life it is good for the weak to have such a barrier, to keep out the enemy. The young man who is not in himself prepared to withstand the shocks and blows of modern life, is blessed if he has a father to bear the brunt of the storm until he can fit himself to brave the tempest.

The girl, puffed up with the sense of her own importance, and the thought that she is capable of looking after herself, may one day be glad to have a mother or friend to stand as a barrier in the way when the enemy is rampant, and there seems no chance of escape.

The business man who, through lack of capital, perhaps, or experience, or both, finds himself attacked and is about to fall, who has a friend who will come to his rescue and bear the brunt of the fight, can count himself a fortunate man.

And for those who are strong, it is good for them to be a barrier.

Do not look scornfully or with disdain upon those who have not the strength that you have, either moral, physical or financial. It may not be their fault that when the enemy came they fell by the wayside. They may have done their best but the enemy was too strong for them. When they call for help, spring to their aid. Get into the thick of the fight, and plant yourself as a barrier between them and those who would do them harm and destroy them.

Use your financial aid to help such as need it; use your influence with others when a good word may turn the tide for some one who is fast going upon the rocks. Go down to the man or woman who has fallen among thieves and is being beaten and robbed, and push the marauders aside, and stand between them and the suffering one, a barrier against which no assault can prevail.

And do not be dismayed or discouraged if, at first, those whom you are attempting to help do not appreciate your efforts in their behalf. They may impugn your motives, they may consider that you are attempting to deprive them of what they think in their blindness should be theirs; they may even believe that you are trying to prevent their happiness.

Keep right on building the barrier that will protect them and keep them safe and, when you get an opportunity, like the mother of the girl in the anecdote, lead them to the dictionary and show them what Webster has to say upon the subject:

"*Barrier:*—A fence or other obstacle, made in a passage or way, to stop an enemy."

Many Men of Many Minds

Robert Bridges.—The happiness of the world calls for generous reconciliation; our national happiness can only come of generous self-denial and unstinted labor. Let every man think and pray and act as devotedly for his country and as little for himself as he did during the war. The need is as great.

George W. Perkins.—One of the greatest advantages in a college training is that the earnest student can learn not only to think but to think straight. The present and the immediate future hold out opportunities such as never before existed for the real thinker.

Bruce Bliven.—Japanese immigration should, in my judgment, be flatly prohibited, except in the case of students, business and professional men, and these should enter the United States for a stipulated period of time, at the end of which they will be liable to deportation. Those Japanese already in the United States should, however, be given all the privileges which are accorded to other aliens in this country.

Philander P. Claxton.—As a people we can afford to increase our appropriations for education until the increase in cost becomes greater than the increase in productive power that comes through education. No people has yet found that limit.

Frederick A. Wallis.—Nothing affects more the political, economic and social conditions of this nation than the foreign-born, and no problem is so great as that of the immigrant. He is the most vital, the most profoundly serious object that confronts Congress today. Our problem is the immigrant, not immigration.

Cicely Hamilton.—In view of the progress of scientific destruction, it is no exaggeration to say that the continued existence of a civilized world depends on the introduction into the counsels and dealings of humanity of an influence that will make for peace. It has been claimed that woman in politics will provide such an influence; but it is as yet too early to say that the process of organization, inseparable from politics, will not act upon her as it acts upon her brother.

William Philip Simms.—Anglo-Saxon solidarity is the world's greatest necessity at the present time. Those who attempt to promote bad blood between the two peoples are irresponsible trouble makers, for whom there is no widespread support.

Anthony Caminetti.—I have been impressed with the apparently authentic reports concerning the great number of people in Europe who are awaiting or desire transportation to the United States and have been wondering what some localities there will do without them and what our country will do with them in view of the reports of increasing unemployment here.

Alvin M. Gc...chall.—A recalled constitution, working laws, roads, schoolhouses and clean water are not liberty and self-determination for backward peoples. But people so far in the depths of barbarism and slavery as those of Santo Domingo never will determine themselves without these aids. Under the conditions of a century ago we might have withdrawn and let them go to perdition in their own way, but the world is too small for that now. Santo Domingo must be guided and made safe for democracy.

Santo Domingo, for Own Sake, Must Be Guided

E. G. Rogers.—Owing to the almost absolute failure of the so-called "melting pot," we are weaker as a nation than we were in my boyhood days. The aforesaid "pot" has produced what to me is a most unsavory stew and it is daily getting worse. It is time we stopped the flood until we can take stock of what we already have and formulate measures to render harmless all that cannot be made beneficial.

Owen R. Lovejoy.—There is no more fundamental line of social endeavor than the development of the child. There is no more direct medium for social betterment than the child. If we can make all our children healthy, well-educated and capable, how many social ills will drop off the map? How many lines of "relief" will become needless? But if we neglect the child today, how much more trouble are we storing up for ourselves for the future?

Sir Hall Caine.—To me it is pitiful that in these desolate days, America, the Spielman of peace, should seem to be the first trumpeter of war.

Gifford Pinchot.—We must put an end to forest fires, and we must save the productive capacity of the virgin forest lands we have left. Thus we shall give the lands which are already cut over, and those which are yet to be cut, at least a chance to serve the Commonwealth by producing wood, and we shall keep lands good for nothing else at work growing trees.

Dr. Pearce Bailey, M. D.—The people delude themselves into believing that when prohibition is enforced the country will need no more saving; and legislators, hard of hearing before, become stone-deaf to the arguments which represent that the problems of degeneracy will not have been met by the removal of alcohol.

Kenneth MacGowan.—A photoplay, like a soap, is a commodity of sale. It may be good or bad. If it is sold properly, the better photoplay will outdistance the worse, just as the better soap outsells the poorer. There is no staggering degree of intelligence, to be sure, among the small shopkeepers of America. But soap is never so dependent on the opinion of this class of men as is the photoplay.

Sir Rabindranath Tagore.—The Great War was one of the blows of God seeking to break down our materialism, our selfishness, our narrow nationalisms. It made a dent, but only a dent, in the crust. Other blows will fall betimes.

Andre Tardieu.—As our Minister for the Colonies said a few months ago, we regard our protégés as men, and not as a nameless and servile horde. Our policy is not one of oppression, but of emancipation. It does not exhaust but fertilizes. It does not exploit but shares. It does not say to the native: "I am the master, because I am the stronger." It says to him: "I am your protector, guardian, elder brother, and you therefore owe me the same respect and deference as are shown to the wisest, best, and oldest man in your own country."

Agriculture—Manufacture—Transportation

Lumber prices are lowest since the armistice, according to the National Lumber Manufacturers' Association. Lumber is piling up and many mills are being forced to close for lack of orders.

The United States has only some 400,000,000 of its 935,000,000 acres of arable land under cultivation, yet among other things it raises one-sixth of the world's corn supply. We could raise enough corn to meet the needs of Europe on the land that is now unused.

Boll weevils annually destroy between thirty and fifty million dollars' worth of cotton.

One-third of the potential food producing area of the world is under cultivation and the crops raised on that one-third increase yearly, thanks to agricultural science.

The House of Representatives has passed the agricultural appropriation bill, carrying $33,877,000.

A get-together conference is to be held in Madison, Wisconsin, from February 1 to 10 in an effort to solve the future outlook of farming for the young man, for the renter and for the owner. A score of organizations of producers are billed to meet at the capital at that time and the meetings will be of state and national importance.

During December the Missouri, Kansas & Texas Railroad reports state that 85 per cent of all freight was moved on schedule and 92 per cent of all passenger trains were on time.

It is said negotiations are under way for operation of a transatlantic air service in 1922. The eastward trip would be from New York to London and the western trip from Lisbon to New York in order to follow the prevailing winds.

In 1919 American corn syrup was distributed to seventy-five different countries.

Gold production in 1920 totaled 2,395,017 ounces. California led in gold production with Alaska running second.

American scientists have discovered the "Columbian berry," a new species of blackberry, about four times as large as the domestic garden variety. The Department of Agriculture is experimenting on the berry with a view to distributing it to farmers of this country. The berry is semi-tropical in nature and will not stand the rigors of hard winters.

Thirty vessels aggregating 180,000 tons have been ordered withdrawn from service by the United States Shipping Board.

On account of its high fertility value and its availability as a feed and the fact that it is a high-priced seed crop, the red clover has been styled the "corner stone" of agriculture.

In 1920 coal production amounted to 646,000,000 tons, the largest peace-year output in the history of the United States.

Clover seed should be tested before it is purchased to determine the proportion of weed seeds and percentage of germination. Home-grown seed is to be preferred as it is acclimated.

Transportation rates of the Canadian express companies will advance from 20 to 35 per cent by authority of the Board of Railway Commissioners. The companies wished to make a general increase of 40 per cent.

Report of the child welfare survey made in Tennessee during the past year shows that more children of both landowners and tenants remain on the farm in diversified farming communities than in those that grow only one crop, such as cotton and tobacco.

Germany is offering the United States high-speed tool steel at 55 cents a pound. The price here is about $1. For many months Germany has been offering steel in South America at prices far lower than manufacturers in the United States have been able to quote.

On coast-to-coast shipments ocean freight rates have been lowered from 15 per cent to 30 per cent on many important commodities.

Last year advances of more than $205,000,000 were made to the railroads from the $300,000,000 revolving fund provided in the Transportation Act.

A new currency and banking act, providing for a central reserve bank, went into effect in South Africa, December 17.

To exterminate the boll weevil in the cotton districts of the South the chemical warfare service of the army, in co-operation with the Department of Agriculture, is preparing to lay down a barrage of poison gas in the fields. This has been used successfully against rats in seaport cities and against locusts in the Philippines.

The Canadian potato crop for 1920 was 138,527,000 bushels.

According to the American consul at Bangkok the Siamese market is developing a demand for wheat flour. Wheat is not an important crop in Siam and there are no flour mills there.

On December 17 a government mail pilot left Cheyenne field at 5:42 a. m., delivered 400 pounds of mail in Salt Lake City and returned to Cheyenne at 4:44 p. m., after having flown 800 miles, crossed the Rockies twice and made two stops.

Great Britain has removed the restrictions on export of dyestuffs, effective February 1.

During the 1920-21 season Holland will have approximately 70,000 tons of white sugar available for export.

Mexico has arranged with American firms for a credit of five million dollars with which to purchase equipment for the Mexican railways, according to cable advices from Mexico City.

Argentina has removed the export duty on wool and on all cattle, sheep and horse skins for a period of one year.

England's air service carried in a single year 70,000 passengers and met with but one accident in which there was an injury.

Briefly Told

Two cannon balls, relics of the Battle of Brandywine, were discovered by a farmer in Pennsylvania while digging post holes on his farm, on which a portion of the battle was fought. They were taken from a ridge which was held by troops of Lord Cornwallis, September 11, 1777.

An oil-drilling outfit in Nebraska struck gold ore assaying thirty-five dollars to the ton.

The Social Service Council of Canada, an undenominational body operating all through the Dominion, has as its object the nation-wide co-operation of provincial motion picture censors in the matter of condemning objectionable pictures.

A wood so hard that steel-cutting tools must be employed in working with it has been found in the African interior. The trees are cut down with chisels or super-tempered saws or pulled up by the roots.

Births in England and Wales in 1920 were the highest ever recorded, and the death rate the lowest, according to official reports.

No vessel of any nationality may enter a United States port or come within the three-mile limit bearing intoxicating liquor in transit without being liable to seizure under the Volstead Act, according to the Department of Justice.

Figures laid before the House Immigration Committee by the Public Health Service show that 9,799 immigrants of 10,002 who arrived at Ellis Island during the last six months of 1920 and whom the health service certified as unable to earn a living because of physical defects or disease were admitted by immigration officials. Also of 112 persons certified as having mental defects, fifty were admitted and of 563 persons having loathsome or contagious diseases, 167 were allowed to land.

The greatest per capita water power development of any country in the world is that of Norway, Canada coming second.

Captain Robert A. Bartlett is seeking to finance an expedition to cross the North Pole in an airplane.

A project to transport coal from the anthracite regions in Pennsylvania into the city of New York through two 14-inch pipes by water pressure has been suggested by an engineer. Pumping stations would be installed along the pipe line to furnish power.

In Brazil coffee is being used as fuel.

A workman in a Utah mining camp threw a bucket of water upon a sputtering electric wire. The electricity "played back" over the stream to the bucket in the man's hands, causing his instantaneous death.

Motion pictures depicting thieving, robbery, murder or suicide will be shown in the Dominion of New Zealand only by order of the government.

Newspapers in China are sold two and three times over. Papers of the previous day's issue are redistributed among the lower class population. They are then distributed again by being sent out to the villages and country districts where they are sold at a fraction of the original cost.

A former soldier now living in Walcott, North Dakota, recently received a notice from the War Department, addressed to his family, citing him for bravery "in giving his life on the battlefields of France." His efforts to correct War Department notice to his family that he had been killed in action in 1918 have thus far proved futile.

Rainbow trout in the ordinary season will begin laying eggs as early as April fifteenth, continuing until as late as May fifteenth, depending upon climatic conditions and the elevation of their waters.

A huge sea monster whose body was found off the Florida coast is a puzzle to scientists. A fragment of the skull was towed to Miami. This fragment is fifteen feet long and seven feet wide and weighs three tons. Sharks were devouring the flesh of the monster, eighty feet of which was visible.

The stems and leaves of the "burning tree" of India are covered with fine hairs similar to those of the nettle, but of a more virulent nature. When touched the sensation felt is as of being burned with a hot iron, the pain lasting several days and extending over the entire body.

Silk substitute has been manufactured from the web of a spider native to the island of Madagascar. It is claimed the product is far superior in many respects to anything that has ever been devised from real silk.

The first woman to be admitted to the bar in China was a former Texas woman, a graduate of the law department of the University of Texas.

The greatest chunk of stone ever quarried or transported in the world is going to be hewn and taken to Washington for the Theodore Roosevelt National Memorial Monument. The memorial is to take the form of a lion and will be carved out of a solid block of rock.

Sponges are gathered in France by means of a submarine. A pair of concave cutting pinchers cut the sponges and deposit them in a specially built basket. Electric light illuminates the deep sea in which the work is carried on.

The cocoanut palm supplies all the needs of the natives of the South Seas. The leaves of the tree when young are eaten, when old woven into clothes, baskets, bedding, paper, hats and thatch. Spears, arrows, brooms, torches and paddles are made of the ribs of the older leaves while the flowers yield wine, sugar and vinegar. The fruit yields food, oil, matting and cord.

Cement is being used as a substitute for lead in joining cast-iron water-pipes.

The ancient Babylonian women painted their cheeks and penciled their eyebrows, according to scientists who investigated the ruins of the ancient dwellings of that period and found vases showing women in the act of painting.

In Northern Siberia most of the food sold in shops is frozen. Meat is hacked with axes and milk is sold in long sticks. The cold is so intense at times that no children are to be seen in the streets.

An attachment to an electric meter will allow the user to purchase a quarter's worth of electric current at a time.

Wages of the native placer miners and washers in the Tigui region in Colombia average from twenty-five cents to one dollar a day.

A nature club for boys in Ontario encourages its members to take the names of native animals or birds, using the Indian version of the name where possible. Each troop of scouts is divided into patrols, each with a distinguishing name of a natural object, preferably some animal or bird.

The famous stone cow of Alan, a small village in the Haute Garonne, France, is the center of a fight between the Ministry des Beaux Arts in Paris and the peasants of the village. The ministry has twice sold the cow, which dates back to the fifteenth century, and each time the buyers have attempted to remove it the peasants have fought with pitchforks and clubs to prevent its removal.

Voices appear louder under a tunnel because the sounds are immediately reflected from the inside surface. On the same principle that a gas reflector increases the intensity of light, so a sound reflector increases the apparent strength of the voice under this condition.

The natives of the West Indies have named the hurricane warning flag which is displayed by the weather bureau, "the devil's handkerchief." The hurricanes are named after saints of the church, and marriage dates, birth dates and death dates are reckoned from them.

Isinglass is made of the dried swimming bladder of several varieties of fish. The best quality of isinglass comes from bladders that are dried in the rays of the sun. The final operation consists of rolling the prepared bladder between two polished iron rollers.

To protect themselves and their homes against robbers the women of four Pittsburgh suburbs have organized a "pistol club." A former major of the United States Army gave the women their first lesson in the use of firearms.

Unless there were airplanes to locate the vessel, one enemy warship, riding the waves beyond sight of the skyscrapers in New York City, could hurl tons of poison gas into Manhattan within an hour and the metropolis would be at its mercy, according to the commander of the Third Naval District.

A Word With President Harding

MR. PRESIDENT: You have now been inducted into the highest place in the Government of the United States. No one knows better than yourself that your selection for the Presidency indicated no overheated enthusiasm for you personally, nor any exaggerated opinion of your ability. The people were simply tired of idealism without realism, of words without works, and they preferred a plain man normally endowed with Yankee common sense to any word wizard or world-minded autocrat.

The people of the United States are going back to first principles, Mr. President; they are giving their confidence again to the truths that made them a nation. They are prepared to believe in you because they feel that you are not too "smart" to be sensible; and they have grown more and more hopeful since the nomination that perhaps you are just the type of man whom Destiny can use to aid the United States at this hour.

Mr. President, you were not picked to be a leader. You doubtess understand that. Neither were you picked to be a follower. You could not very well be that. You were chosen for the exalted place of Servant, and all your fellow-citizens are your fellow-servants in the service, *first*, of the United States, and through the United States to the world. It is probably not too much to say that your entire administration and your place in history will depend on the fidelity with which you seek to serve the people through the government.

It is not out of taste to refer to your predecessor. Mr. Wilson attempted great things and f a i l e d — unnecessarily failed, as many think, because he took the role of Lonely Leader instead of Fellow-Servant. We mention Mr. Wilson because many of your problems will be an inheritance from his administration.

The country feels that, after all, perhaps it was Destiny that prevented the United States from entering the League of Nations as it is. More and more the people are coming to understand that, whatever its faults may be, the Senate of the United States, of which you were a member, served the nation well when it refused the Treaty which included the League with all its specific and implied obligations. The country is now more capable than it ever has been of distinguishing between the undebatable ideal of universal disarmament and peace, and the debatable method by which four men decided it could be obtained. There is no doubt about the thing desired; the *method* is another matter.

Mr. President, the election only excused you from following a certain method; it did not excuse you from the main object.

The nations are now more anxious to disarm than ever they were to have the war stop. In some ways they feared to have the war stop. But there are no two minds as to what they would do now—they would do anything to get rid of the burden of building up again the war machines which the great struggle destroyed.

Your own country, too, Mr. President, now pays 92 per cent of its total income for that which not only does not enrich its life at all, but keeps it poorer than it ought to be. Think of it, Mr. President: 92 cents out of every dollar, 92 dollars out of every 1oo dollars, 92o dollars out of every 1,ooo dollars, 92o,ooo out of every million dollars, 92o,ooo,ooo out of every billion dollars—and all for that which is mere burglary insurance against war. Think of a man working for $2oo a month who should be compelled to pay $184 of it for insurance! Yet the United States has been doing and is now doing that. Have you considered where the profit goes?

We are taxed too heavily now. We who did not profiteer during the war are paying just as heavily as if we scooped in millions; and it is not only for the war that is past, but wars that may never come, that we are paying. Taxes are a tight brake upon industry today, Mr. President: remove the cause, and that will reduce the taxes, and let industry go free.

You have an opportunity to gain for the world all that Woodrow Wilson sought, and to gain it with a grand simplicity. Get them to disarm, Mr. President. If you, as President of the United States, propose it, it will be the one ground on which disarmament can be begun. If America is willing for herself, if she wills it for the world, the world will then have the one basis of action for which it is waiting.

It will not be a noisy event, Mr. President, this world disarmament. It will come as the armistice came, out of a clear sky. A very small room would hold all of the men whose "yes" would lift the burden off the nations. It is going to be done, Mr. President, and very quietly—just about the way your type of a man would do it. The Christian world is ready for it, willing for it, and the rest of the world will follow at a word.

Thus you can achieve for the United States and the world all that your predecessor sought in cumbrous covenants; and instead of trying to organize for peace a world that is prepared for war, you can secure more than covenants, more than leagues, more than world courts could have secured, by getting first of all the fundamental necessity—voluntary and universal disarmament.

Mr. President, there is a destiny that rules the Republic and its mission must be fulfilled. Our national mission is peace. And apparently it is left to a plain man like yourself to be the fortunate Public Servant through whom it may come.

Coaching the Youth in Good Citizenship

By UTHAI V. WILCOX

"MORALS was an elective in the college where I attended and I didnt take it," a young man once laughingly told me. Which is quite the way we as a nation train our boys and girls in a right understanding of their civic duties. They may or may not learn that the franchise is something that should not be regarded lightly. They *may* grow to believe that civil government is an organization of greed and selfishness. They may *not* be taught that government is an organization intended for the mutual protection and benefit of all.

The difference in their belief—in their early training—will make a great difference in the future stability of democratic institutions. The first belief can quickly make Bolsheviks, the second, true Americans. Yet their training is generally left to chance.

It is much more important that the boys and girls grow into citizenship with a definite knowledge of their responsibility, than it is that they merely reach their voting age and then register as Republicans, or Democrats, or Prohibitionists, or Farmer-Laborites.

"When I was twenty-one years old I registered as a Republican not because I knew very much about the Republican party except in a very general way, but rather because my father and his father had always been staunch Republicans, and I knew nothing else," said a prominent man speaking of his childhood.

"I was always taught to think that the Republican party was always right, and never wrong," he continued. "That the Democratic party and all of the others were organizations that were working for the destruction of the country."

This man who is now a prolific writer and himself a molder of public opinion, stated but one angle of the result when boys and girls are allowed to grow into manhood and womanhood without any definite instruction and education along the lines of civic righteousness. Either prejudice and tradition rule, or the whole matter becomes one of indifference. One state of being is just as bad as the other. It is just as easy for the political "boss" to control things for his own ends with one sort of voters as with the other.

The hope of the nation—the hope of democracy—is that parents and teachers will combine to educate the youth in politics, at home and at the school. It should no longer be allowed to be an elective.

The responsibilities of citizenship should be impressed upon them as soon as they are capable of understanding the first principles of organization and government. This will come to mean to them that youth is a preparation for the larger life, one of the profoundest responsibilities of which is the discharge of their civic duties.

The whole matter is fundamental. It begins with obedience in the home. If this is exacted with proper explanation it is then easier for John and Mary later to understand the reason for the laws and requirements of civil authorities.

Judges and authorities on prisons affirm that criminals are mostly men and women who have gone wrong because of some lack in their training, generally, some phase of what might be called the "institutional sense." These men have never been made to realize that the state, the school and the church all exist as institutions aiming at the improvement of human society. Yet these things can be easily explained so that most children can understand readily the basic phases of them.

In a western state where the initiative and referendum are parts of the constitution there was a great moral issue at stake. After the election it became known that nearly a million dollars was spent at the polls as a means of defeating the issue. A man who had to do with some of the spending said: "The price paid for votes was usually five dollars each. The poor devils needed the money and took it."

What hope is there for the future if the boys and girls of today are to grow to citizenship with no better conception of civic righteousness than the men who partook of parts of the millions of dollars in exchange for their votes?

It would seem that one of the first things that John and Mary should learn is the sacredness of the franchise. It is not difficult to teach this so that they will never be in serious danger of being corrupted.

For example, it is a spendid thing to encourage even boys and girls to take part in school elections and politics. Let them select their own leaders—captains of their teams, of their classes, of their clubs.

The Roman youth was allowed to choose among other things, the profession of politics. Unfortunately the word has fallen into ill repute or else the profession has been debased. The training of citizenship, however, may well be selected for the youth of today as a necessary essential in their education. This applies to both sexes.

"We had a big time electing our class officers," said a ten-year-old boy at the supper table one evening. "Some wanted Floyd Tait and others wanted Albert Burns. I told them that Floyd ought to be elected because he keeps up with his class even if he does have to do more work at home than any of the other boys."

This youngster was learning the fundamentals of citizenship. The qualifications necessary for the proper fulfillment of the office were being—perhaps unconsciously—outlined in his mind. With continued direction by both parents and teachers this class of pupils would soon be nearer ready for citizenship than many if not most of the now registered voters.

Honesty and integrity are not matters of natural inheritance only, as some might suppose. They are a part of the education, and come with slow-growing development, to their full conception. The well-rounded citizen is one that has learned to think instinctively along right lines and to judge by high standards, rather than merely fine phrases that mean nothing the morning after election.

When the high school is reached the young people are ready for the intensive finishing touches that will prepare them for taking an active and honorable part in the affairs of their country. More insistence in the actual government of the school, coupled with the responsibilities attached thereto will make the lessons practical.

It is now that the father can and should seek to add the personal touch that will make the whole education vital and seriously important.

A father's business in teaching his children is more than rearing little Republicans into big Republicans, or little Democrats into big Democrats, or little Socialists into big Socialists, or little Prohibitionists into big Prohibitionists, or little Anarchists into big Anarchists. But that is the parent's natural tendency, and it is the wrong way to make good citizens.

Such a course is an injustice to the boy and the girl and it is an injustice to the state and its future development. It naturally leads to the much paraphrased belief, my party right or wrong, but still my party.

It is human nature to be partisan and to want to bring another recruit into the party ranks, but it is wrong to develop an American that when he is old enough to think might not desire to be connected with such a group.

It requires a great deal of broadmindedness to carry out such a program of non-partisanship in the education of the youth, but a little analysis will show that this contention will stand any argument that may be brought against it.

For instance: A man may be engaged in the junk business and like the junk business, and enjoy it, yet he will hesitate before he will insist that his boy must grow up to be a junk-man. He doesn't try to force the junk business on him. Instead, he, with his wife, undertakes to discern in the developing boy those tendencies which make for success. If the boy likes to draw he will send him to an art school. If the boy likes to dress his own black eye which the boy around the corner has given him, he may try to make a doctor or a nurse of him. If he likes to go to school and make speeches, he will probably send him to law school and make a lawyer of him. He tries to treat the boy as an individual and thus develop his individual traits. That is one of the functions of fatherhood.

And the junk business is not so far different from training the younger members to be Republicans or Democrats. That is, Mary and John are entitled to be treated as individuals in the question of choosing their party allegiance. They may look at things differently than the father, and their views should be respected. Let the emphasis in party allegiance come in the matter of honesty, principle, and the constant working for the great aim of civilization—the bettering of the *whole* people and the protection of the weak. Principles above party; place as a reward for service that looks toward the future *as well* as at the present.

You cannot argue with a dyed-in-the-wool Republican or Democrat. Why? Not because he has studied the question about which you have been talking but because he has come to listen to only the party side of it. As Paul, the apostle, said, "Brethren, these things ought not so to be."

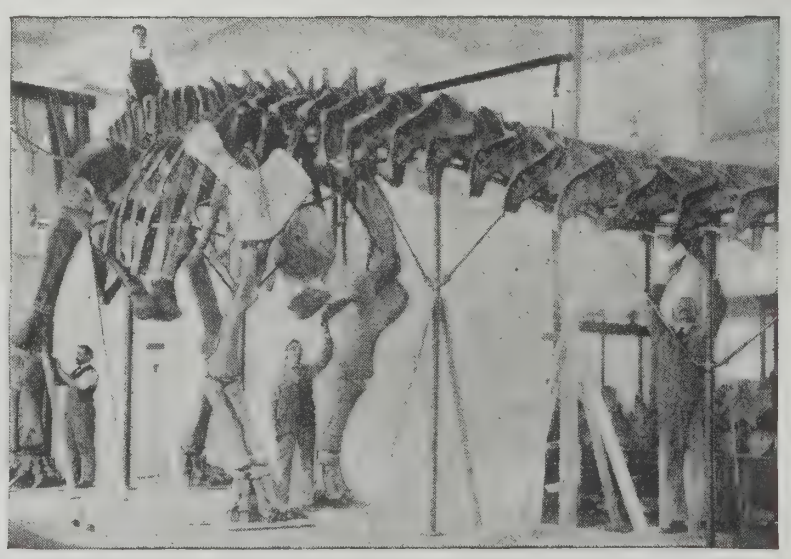
Let the political science as talked over at home be along these lines:

First of all, that men and women are equal in politics; that they share equally in the responsibilities.

Second, that it is their duty to take part in the important questions coming before their community and nation; to study the underlying principles and to vote according to their best judgment and education rather than from prejudice or party insistence.

Third, that the county and state will be better governed, that boss rule can and will be eliminated if each citizen will take an interest in the shaping of issues and the election of men to office.

Fourth, let the influence for progress be *constant.*



Along with these simple principles let the father recommend that his family keep in touch with world affairs by reading a good reliable newspaper, weekly journals and informative monthly magazines. Periodicals of current events will soon hold a normal and healthy attraction for the coming generation that will help to educate them in progressive lines. The subscriptions to such papers will be worth-while investments to the upbuilding of the characters of their sons and daughters.

As long as political affairs are left to those who are merely interested in getting something for themselves, the corruption of the ballot box will continue and the rights of the common man will suffer and there will be growing communistic parties and increasing anarchy, and the promulgation of strange doctrines. But if we make it an important matter to bring the youth into intimate knowledge of current affairs, the degraded type of politician will be compelled to give away before the force of enlightened public opinion.

Fifteen minutes a day at the close of the evening meal would be ideal for a healthy discussion of the events of the world and their relationship to that of the nation and state and community. It would prove beneficial not only to the young man and woman but to father and mother as well, and would tend to make them all broad-minded and cosmopolitan in their political views; unmoved by the flag-waving and the "straight-ticket" speeches of the party henchmen.

Reconstructing Denizens of a Past Age

At the American Museum of Natural History, New York, the many naturalists and scientists employed are now exceedingly busy reconstructing for exhibition purposes the finds during the past summer of the field workers of the museum. For the past few weeks this material has been gradually drifting in. Once arrived at the museum, the specimens find their way to the preparator's room where experts carefully remove the plaster covering. They are then assembled on long tables, as shown in the photograph at the left, where they are assorted by men highly skilled in this work. The next step, as shown at the right, is the assembling of the skeleton, this one being that of the brontosaurus.

The Mystery of Woodrow Wilson's Reverses

A Victim of Office-holding Friends, the "Man of the People" Became Estranged From Public But Continued as Its Spokesman

By A. R. PINCI

A FEW days after Easter Sunday, 1913, the late Pope Pius X, after blessing half a hundred pilgrims in the Throne Room of the Vatican, granted me a few moments of his time, eagerly wishing to hear my description of Woodrow Wilson, who had a few weeks before assumed his duties as President of the United States.

"A man of the people," the Pontiff benevolently mused, repeating my words; "God bless him!"

His eyes were inscrutable, partly due to the illness against which he was so valiantly struggling, but the words, uttered within that huge and historic hall, the birthplace of several centuries of history, seemed like a sign of the future—a conviction that greatness and fame are fleeting.

A man of the people.

That was the most concise, convincing and complete picture I could convey about the newcomer in American national politics, then regarded by Europeans, as well as a few Americans, as somewhat of a mystery. It was my own appraisal of the man Woodrow Wilson, who before his election had been good enough to interpret for me the "new freedom" he so ardently championed.

The statesmen I met in Europe that year included many who were destined at a later day to meet President Wilson personally. If they thought at all about my five-word verbal biography of him they could be pardoned for believing that it did not fit. It could not be made to fit, in 1919, even if they made allowance for the reported vicissitudes of the intervening six years; the new mold of the man bore no resemblance to the cast made by me. I realize that as well as they.

Twenty years of more or less intimate professional contact with statesmen of two continents has made it necessary for me—and to my colleagues engaged in similar work—mentally to appraise them and their character at a glance; to single out their proclivities, be they of conceit, fastidiousness, service or fanfaronade, as the open sesame to future relations.

A mental thumb-sketch of Candidate Wilson was indispersable because my interview with him at Sea Girt, which he granted with cordiality, had not been without obstacles, and what impression of him I retained as the result of an impersonal meeting or two as president of Princeton, was too superficial to be of much use. When the new freedom was discussed, Woodrow Wilson exposed his best self and revealed himself no more and no less than a man of the people. At that time he was an unobtrusive American whose self-confidence was born of faith, suddenly projected before the attention of a cynical world, which he ignored with regal indifference.

The Beginning of the Change

THE difference between the new freedom as a theory and as a fact was great, and I voiced my comment, which he countered with an enthusiasm utterly devoid of infallibility and arrogance, two qualities already attributed to him by many antagonists. At that time his will was submerged; in fact, he was almost self-effacing, as he gave the right of way to the ideal which he espoused. Now of course I realize that the dual personality of official and teacher emphasized his academic self against that of public man; neither he nor his visitors were conscious of the fact that though the official *thought* the professor *acted*. This subtle psychological difference will explain many otherwise baffling attributes that have confused both his admirers and critics.

The change in Woodrow Wilson, however, is not a figment of the imagination. He has changed. He himself, probably unaware of just what he was trying to convey autobiographically, indirectly referred to it in the course of an intimate talk at the National Press Club of Washington seven years ago, when he confessed his "sense of confusion of identity, sometimes, when I read articles about myself. I have never read an article about myself in which I recognized myself, and I have come to have the impression that I must be some kind of a fraud, because I think many of these articles are written in absolute good faith. I tremble to think of the variety and falseness in the impressions I make."

Therein is concealed the cause of error. Woodrow Wilson tried to perceive himself as he thought he was; his descriptions on the contrary depicted the constant change without actually pointing to the metamorphosis. The average writer bold enough to describe President Wilson in the early days of his term was a keen analyst and wrought a very good portrait albeit incomplete; the likeness was as of the time of writing, in ignorance apparently of the man as he was before 1910, or, at all events, between the time he became governor of New Jersey and President of the United States. And Mr. Wilson for years has been unwilling to accept himself other than what he has persisted in thinking he is, with the tragical result that a few persons, willing to acknowledge the continual existence of the former Wilson, have enjoyed his esteem and confidence against the opposition, in certain cases, of the entire nation.

Briefly, Woodrow Wilson, the man of the people, apostle of the new freedom, destined to reach and fail to grasp eternal fame, unconsciously became another personality when what had been his predilection became his vanity. From that moment, of doubtful chronology, but probably occurring late in 1912, his Lincolnian gospel of the people, for the people, by the people was replaced by a newer one; of the people, for the people, by Wilson. Not that Mr. Wilson considered himself a superman, then or later, but relapsing into his former educational frame of mind, probably considering the American people as so many more students, he moved with academic precision and routine. Intractability on the part of the people, directly or through their chosen legal representatives, was countered by growing intolerance on his part, with the eventual result at the election of last year.

It is quite possible that that verdict by suffrage had less direct concern with the merits of disputed public questions than as a protest by an irritated population against "being kept in school." For that is just what Mr. Wilson did with the people; he separated them into classes and subjected them to being taught a variety of things for which they had no sympathy or which they considered as none of their business to learn. Whether it would have been to their advantage to learn hardly entered into the question. And, like scholars the world over, when the teacher becomes objectionable his value as an educator is lost. The American people's verdict was directed, therefore, to that product of politics and narrow-mindedness that substituted the Wilson that the same people greeted, not hailed, a few years before. And in multiplied measure he has suffered in esteem abroad.

His Too Friendly Friends

A COMPREHENSIVE but always incomplete biography of Woodrow Wilson would be a matter of many volumes, because it would have to be a study in comparative facts as well as fancies. The deadly parallel would work havoc, as all those who have followed his views very well realize. The single-track mind became a plastic one, but this change was metaphysical. Woodrow Wilson has been less conscious of it than any one else. Not a word or act of his, so far as his innermost thought goes, has been detached from his basic idealism of the new freedom, which in his estimation became pyramided into the League of Nations.

On the other hand, Mr. Wilson, I believe, overrated his analytical powers in that which concerns human nature. If one reads his booklet, which has so far escaped public attention even though it was published twenty years ago, "When a Man Comes to Himself," it becomes evident that as a character reader—especially of his own—he has not succeeded. At only one point, in the light of what has happened since then, has he plumbed his soul; "there is no fixed time in a man's life at which he comes to himself," he wrote, "and some men never come to themselves at all." As I see it, he has as yet not come to himself. That would explain his difficulties in being in sympathy with a people none too ready to support him. For eight or ten years he has been convinced that he concealed his inner and sensitive self, as he described it repeatedly, from the curious and cynical outer world, while at the same time sure that he pulsed the slightest change in the masses. This delusion is not very likely of his own making, but one artificially stimulated by those semi-intimately surrounding him.

In fact, I believe that Woodrow Wilson has been the victim—and history is full of such—of too friendly friends. They tried to protect him from what they pleased to call a rough and selfish world and substituted their sycophantic adulation, and a man may be forgiven if, after nearly forty years of adult life passed in seclusion and from contact with man's elemental passions he is unable, upon suddenly emerging as a public character, to analyze profoundly the intricacies of those emotions of the masses that collectively run the world.

In the summer of 1912 Governor Wilson was very frank in admitting, privately, that democracy's chances were largely related to the usual ill wind, and so on. For that reason he was very careful—and I remember his repetition of the familiar phrase—that if elected he would consider himself spokesman "of" the people.

But the idea miscarried; he became a spokesman "for" the people.

Some Quit When They Disagreed

THUS we approach an understanding of the Wilsonian tergiversation. President Wilson was predisposed toward being an autocrat or if not autocratic, despotic as an outgrowth of collegiate disciplinary responsibilities. His positive or arbitrary attitude, however, was seldom consistent; his own intimate official creatures manhandled it to suit themselves, but it was peremptorily invoked against certain groups and individuals. Thus we have the key to what nearly everybody considers an unexplainable characteristic of the former President—the ease with which he was abandoned, or permitted himself to be abandoned, by men of maximum intellectual capacity. The only ones who established a record in keeping abreast of him, but eventually sidetracked, have been men famed for their silence. Conspicuous among these are former Secretary of State Robert Lansing and Colonel E. M. House. But other men like William Jennings Bryan, Lindley M. Garrison and Franklin K. Lane, went along as far as they consistently could do so—and then quit. Professor John Bassett Moore was the first man to lead the exodus.

But although predisposed to be yielded to, I am sure that Mr. Wilson combated this inclination in the early months of his administration. At least, he tried to, and it may be that eventually he thought he had vanquished this dominating instinct. But he had not. It was not long before he became a recluse, establishing his own niche which none dared trespass, thus making the mistake that cost him not only irritation, sorrow and even illness, but kept from him the love of the people, a love that seemed as if conditional or in suspension, pending upon some manifestation that never materialized. For a time the country was divided against itself on this one point, but the result has been unmistakable. Though it may not have seemed so, it was a choice as between certain friends on the one side and the people on the other, and he chose to stand by the former.

Where the Party Is Today

THAT this love or sympathy was never accorded is a fact. One need only think, sometimes with anxiety, of the ease and familiarity with which his name has been bandied about, the subject of quips, allusions, regrets and sarcasm. If *majestatbeleidigung* were law here the jails would not accommodate prisoners. And this unexplainable tendency has startled foreign visitors who have unhesitatingly published their observations. And as it declines here it grows in Europe.

I remember the closing days of the Roosevelt and Taft administrations quite well, as my newspaper work kept me in touch with high officialdom of the time. The natural readjustment of personnel was not accompanied by any bitterness; I mean collectively. Of course, the sinecures were not very numerous as compared with the end of 1920, but a pro rata comparison is hardly in order.

The repudiation of the Democratic party in 1920 was punitive but not destructive. It served merely to put the Democratic party back where it was in 1912, allowing for changes in personnel. President Wilson, who disregarded the first electoral referendum he invited in 1918, heard from a bigger electorate in an unmistakable manner, at his express invitation, in 1920. Oddly enough, he and his associates, anxious to enlist the vote of women by Constitutional amendment with the presumption that those women would vote for the "anti-war League of Nations" as they locally won for him his second term on the strength of peace in 1916, failed in their psychological analysis of feminine attitude. It is generally taken for granted that the women voted as did their male relatives and friends, with no visible effect in behalf of Wilson policies but swelling the total to unprecedented proportions. On the other hand, many a woman has voted against the Democrats because she intuitively felt that the Cox-Wilson anxiety compared to Wilson's adamantine attitude five years ago when suffragists were picketing the White House, was not disinterested.

Not a few of the suffragists, therefore, long ago discounted the efforts of President Wilson in their behalf. That did not make for his continued popularity among the women—and women can be very bitter in these circumstances. In fact, they are unyielding. These women must be added to that group of truculent partisan officeholders who add to the ranks of anti-Wilsonists by constant reproaches.

The Outcome of the Conferences

WHAT happened last November was invited and facilitated by Mr. Wilson himself and, therefore, upon him rests the responsibility—not on the country. In the strict sense of the word there is no greater autocrat than Mr. Bryan. He could not enforce his views, so he left the President, but has remained unyielding as a Democrat and as an upholder of the popular principle of government by majority. Said Mr. Bryan after the election:

"The President attempted to drive out of public life every Democrat who dared to differ from him even in minute details while he made no effort to strengthen the Democrats who made him keeper of their conscience. He alienated all Republican support and invited partisan opposition by his appeal, just before the election of 1918, for a Congress that would support his personal leadership, and then, though knowing full well that the majority in the nation was against him, he refused to deal with the Senate as a co-ordinate branch of the government."

I referred to the fact that his more or less intimate public officials have been the cause of his downfall. In this respect there has been a White House oligarchy logically comparable to anything existing at Potsdam or Tsarkoë Selo in pre-war days. The open door there was the first promise made by Mr. Wilson when he took office, and in a way the door has been open, but a count of those who have successfully crossed its threshold would yield a ridiculous total. A dozen names would cover the leaders and the followers. To be exact, the door has always been open to almost anybody—and there it ended; the room was empty.

The newspapermen promised themselves a fruitful era of news when it was decided that the President would receive them twice weekly for a conference.

Democracy's Safeguard

THOUGHTFUL men and women are convinced that there can be no greater menace to the success of democracy than a spreading and deepening suspicion among the masses that the courts of the land are not always to be relied upon for that exact and equal justice which must ever be the corner stone of any truly democratic system. During recent years a favorite charge of the radicals, that is to say, of the avowed foes of all government who go under that name, is that our judges are respecters of persons and amenable to improper influences. This indeed is the main weapon of "Red" assault. They well know that if the taint of prejudice or of corruption could be fixed upon the men chosen to dispense justice, the process of undermining our institutions would be well advanced.

For these reasons, we must welcome the decision of the Supreme Court in the Berger case. Not because it clears Berger—which it does not—but because it with clarion clearness lays down the principle that an accused man must have a fair trial and to that end it is imperative that the rule in Section 21 of the Federal Judicial Code, requiring the assignment of the case to another judge whenever the party to any action shall make affidavit that the judge before whom the action is to be tried has a personal bias or prejudice against him," shall be followed. Congressman Berger having been indicted for obstructing our war with Germany, made such an affidavit, setting forth alleged utterances by Judge K. M. Landis showing virulent hatred of Germans and of Americans of German birth and blood. Judge Landis, while admitting these utterances (in one of them he said: "One must have a very judicial mind indeed not to be prejudiced against the German-Americans in this country; their hearts are reeking with disloyalty"), denied his disqualification, denied the motion for the assignment of another judge, and the case proceeded to conviction resulting in sentences of twenty years' imprisonment for Berger and his associates.

It should be obvious to the most thickheaded of junkers that they must not be allowed to use the courts of the land to bludgeon justice in order to vent their own prejudices or buttress their own special and selfish interests as against classes or individuals of whom they disapprove. The case of Mooney is like that of Berger in that it involves issues far transcending personal or class advantage or disadvantage—issues vitally involving the honor of our whole judicial system. And if it is of fundamental importance to the health and permanence of democratic institutions in America that the lower courts should at all times be trusted justly to weigh evidence and interpret the laws of the land, occupying a plane absolutely free of class or partisan political bias, this is true in largest measure of the Supreme Court. Once let real ground be afforded for suspicion on this point and our courts will not only forfeit all title to the respect and confidence of the people, but a blow will have been delivered at the very heart of the republic more dangerous far than any that has been laid to the charge of the "Reds" so pyrotechnically "rounded up" and deported.

The Island of Yap

IT IS encouraging to find that, in the recent International Communications Conference at Washington, France and Italy have shown evidence of agreement with the position taken by the United States in regard to the limits of the mandate for the former German islands in the Pacific granted to Japan. Our representatives at the Peace Conference in Paris distinctly recognized the special importance of the Island of Yap as a cable relay station. On this account, they insisted that the island should be used by all nations on terms of equality as a base for cable communications and operations. Reservations made by both President Wilson and Mr. Lansing laid it down as a distinct understanding that because of its importance to the freedom of international communications, the Island of Yap should not be mandated to any one country, but administered by a commission to be appointed by the League of Nations.

These reservations are on record, and the United States Government now holds that the decision of the League Council in May last including Yap in the mandate accorded to Japan over former German islands north of the equator is in plain violation of this understanding.

It is unfortunate that, so far, Great Britain seems to be backing Japan's claim to the inclusion in her mandate of this bit of barren rock in the Pacific whose situation gives it such tremendous strategic importance. Taken in connection with the recent refusal of our Federal Government to permit the Western Union Telegraph Company to land their new South and Central American and West Indies cable at Key West, because of an agreement with the British Government giving it priority over the Government of the United States, the situation is one of ill omen.

This entire struggle for a national rather than international control of international lines of communication looks very much as if our recent allies in the war to end war were thinking much more of future military and naval advantage—as against this country—than of establishing world peace on sure foundations.

The stand taken by our State Department in the matter is obviously one based on right and justice. And, both as a measure of rightful self-defense nationally and as a step in the direction of international peace, it is to be hoped that the virtual agreement to internationalize this important naval station will not be blocked by selfish and technical objections.

The Franco-Polish Entente

MUCH may be said in favor of the recently completed agreement between France and Poland, if the semi-official forecast of the text is to be accepted. Militaristic tendencies and aspirations on both sides and the restrictions imposed by the Covenant of the League of Nations seem to have been gotten around in the clauses dealing with the subject of French protection of Polish territory against aggression "from the east or the west." That, of course, means from a Bolshevist Russia or an imperialist Germany. France binds herself to furnish material and technical aid to Poland in such case. Although not "compelled" to send troops to Poland's aid, France secures the right to reconstitute her military mission at Warsaw and Poland pledges herself to such a reorganization, presumably under French direction, as will effectually strengthen her army.

These steps are taken, it will be noted, in season to meet and check the second Bolshevist offensive against the Polish frontiers which there is good reason to believe is scheduled for May next. Remembering how, only a few months ago, the triumphant advance of Trotsky's Red Army on Warsaw was thrown back in the nick of time, thanks entirely to French military direction, the new entente may be regarded as affording substantial hope for the formation of a lasting barrier to the Bolshevist menace. Long ago, Napoleon described Poland as "the keystone of Europe." Marshal Foch, who so magnificently vindicated the scientific soundness of Napoleonic strategy in the recent war, may be presumed to have a full appreciation of the weight to be attached to the saying. Nor are we to assume for a moment that Trotsky in the least undervalues the tremendous importance geographically and militarily of the Polish Republic. The Soviet leaders plainly enough realize that unless they can sweep across Poland to Western Europe, they are doomed to speedy extinction. World-wide revolution is openly and incessantly proclaimed to be their dominant purpose. As a matter of fact, it is their one hope of survival even within the borders of Muscovy.

Significance attaches to the fact that the new agreement contains important economic as well as military accords. Profitable exploitation of the Galician oil fields by a Franco-Polish company and tariff provisions calculated to foster commercial relations between the two countries are essential clauses of the understanding. The fact of the agreement in itself may well serve as a deterrent to Bolshevist aggression. Certain it is that the best interests of both countries will be served by the prevention, rather than the provocation, of hostilities. It is to be hoped that the new agreement will prove to be the proverbial "ounce of prevention."

The Dreamer

THE assertion is often made that the days of the dreamer are past; that this is the age of the practical, common-sense man and woman, who have not the time nor the inclination to dream dreams and see visions as some of their fathers may have done; that these are days of work, and the chasing of the elusive dollar to the exclusion of the poetry of life.

This in one sense may be true. Few dream of chivalry and emboldened knights riding forth to battle for their ladies, of the pipes of Pan or lilting maidens such as endeavored to entrance Ulysses. Even much of the verse which is written today breathes of the labor and strife and turmoil with which we are encompassed. And yet nothing great was ever accomplished that did not have its inception in dreams.

Columbus dreamed of a new world far across the sea, long before he embarked upon his voyages of discovery. "A dreamer" they called him, and he was content to be known as such. Franklin dreamed that electricity could be harnessed; and Field that the ocean could be bridged by a cable; Edison that the human voice could be reproduced on a metal cylinder, and Marconi that the air could transmit sound waves. If they had not dreamed, what they have given to the world probably would never have come to pass.

A towering building, beautiful in architecture and symmetrical in proportions, had its inception in the mind of some man who saw it in his mind's eye before the plans were made. A giant locomotive, a majestic bridge spanning a river, a ship with wings sailing through the air, were made possible because some one dreamed of them long before the details were reduced to paper.

It is the dreams of the man and woman of today, of what they hope to accomplish, that give them strength to strive for the goal. Perhaps it may never be reached, but the dream gives comfort and happiness along the way.

Edwin Carlisle Litsey once wrote:

Each of us has his golden goal,
Stretching far into the years;
And ever he climbs with a hopeful soul,
With alternate smiles and tears.

To some it's a dream of high estate,
To some it's a dream of wealth;
To some it's a dream of a truce with Fate
In a constant search for health.

To some it's a dream of home and wife:
To some it's a crown above;
The dreams ahead are what make each life—
The dreams— and faith— and love.

So dream on, thou dreamer, and may your dreams one day be transformed into realities. Dream of the things that shall make this a brighter, and happier and less sordid world. Care not if some may chide you and laugh at your aspirations, and say that they are mere will-o-the-wisps, intangible, and can never come to pass.

Dream on!

Money for Fireworks

DR. A. F. WOODS, president of the University of Maryland, is a rare bird among academic executives. He has the gift of plain speech understood of the plain people. And the plain people should hearken to him.

In a recent talk advocating disarmament, Dr. Woods gave us a homely and convincing illustration of the difference between the spending that means waste and the spending that means profit. "Water going over the falls," he said, "is spending its energy. If it turns a waterwheel, at least a part of that energy may be transformed into the power of the waterwheel. If that power is transferred to the machinery of a mill it may furnish flour, lumber, light and electric power. Money used in thus saving and utilizing or storing this power is not 'spent' in the ordinary sense—it is invested. If it is wisely invested, it returns itself manyfold. The largest expenditures today by the great nations are for war purposes—armies, navies, armaments, munitions, fortifications. In any case, let us not spend our money for fireworks when it is so sorely needed for industrial and social development. Money put into improvement and cheapening of transportation and communications, improved roads, schools, homes, health and agricultural, manufacturing and living conditions generally, is invested rather than expended."

It is about time that we got it into our heads that there is no dodging the ancient and natural law that want and woe must follow waste—and the waste of war is the worst of all waste. It is the sowing to the wind that leaves us no harvest to reap but the whirlwind.

Mr. Ford's Page

MOST of the wisdom of the world was in the copy books. The lines we used to write over and over again, the homely old maxims on which we practiced to obtain legibility of our p's and q's, were the essence of human wisdom. They were the first-aid packages which the philosophers made to assist men who might need help out in the midst of the field of life. Most of the books that have been written since the copy books are only commentaries thereon; they say with more and harder words what we used to read in our first lessons.

It isn't learning, it is wisdom or plain sense that helps one through. Any man can learn all that he needs to know. No one ever learns more than he wants to know. We never learn anything unless we want to. Sometimes you will find a man with what appears to be a lot of useless learning and you discover that he accumulated it not because of his interest in its special departments, but because he thought that acquaintance with a multitude of subjects added to his prestige. He accumulated knowledge as he accumulated neckties or golf sticks.

The whole secret of a successful life is to find out what it is your destiny to do, and then do it.

Now, that idea has several sides. When we speak of what we "do" we usually mean what it is we "do" for a living. "What are you going to do when you are a man?" we sometimes ask the children; it means at what occupation are they to be engaged.

Well, we all have to work. But most of us have something else to "do" as well. If all that a man has to "do" in the world is the mechanical operations he performs during working hours, then it would follow that if machinery should be invented to perform that operation for him, he would have nothing to "do." One of the really useful figures of his time used to say that his work was of quite a different character than appeared to observers; the observers thought he was a cobbler; but he said he mended shoes only to pay the expenses of his proper work.

We toil because we have to square our debt with the earth—we have to pay for the wealth she lends us in every material thing we use. But what do we do with the life that we thus buy? That is the true form of the question as to what we "do."

But there is something besides our toil—there is also our work. Our toil is what we have to do to bear our part of the work of production in which mankind is engaged, and the fruits of which are essential to our well-being. That is our toil. But our Work is that which we would do all the time if we could. Happy is the man whose toil and work are one. There are many, however, not so happily situated.

Most of us are doing two things: that by which the body is kept alive, and that by which the higher part of our nature lives. We go to the job to pay expenses, and then we indulge ourselves in what we like to do, and maybe were meant to do.

That is the secret of all the "amateurs" in the United States. Amateurs are not always what we think they are. They are often more intelligent and skillful than the professionals. We shall have to change our ideas of the meaning of amateur; formerly it meant those who knew very little and were unskillful, those who had a liking for an art or a science, but merely dabbled. That idea will have to go in favor of the truer one, that the "amateur" differs from the professional only in this, that the professional gets his living by it and the amateur does not. In some respects the amateur is better off, for he has two fields—that by which he pays expenses, and that in which he finds expression.

It is amazing to find how many people in the United States have evolved financial systems. Here, there, everywhere are men who have occupied their spare hours with the great subject of money. Farmers, store-keepers, mechanics, country editors, could collectively roll up a mass of research and speculative literature on this subject that would literally swamp the received authorities in the region of finance.

All this has a meaning. It means that the people are being prepared for something in the money realm. When you find receptive minds in all classes of society being moved by the same master note, you may be sure something is coming. All this mass of thought by plain people is the prophetic soil whence shall come the one whose mind can gather up all the fruitage of the others and bring the epochal change to pass.

In truth there are no discoverers. Nothing is ever entrusted to one man alone. We know now that no one man invented printing; the idea was seeking incarnation and found its way into life through several men at about the same time. Columbus was not the only discoverer of America: other men's thoughts had been set this way. Destiny takes precaution that no purpose shall fail through the unfaithfulness of one man, and so the new truth is entrusted to several. It is this which leads to so many bickerings in the matter of discoveries; it is hard to prove who was "first"; the idea was abroad "in the air," and it came through to the minds that were receptive, that were keyed to its quality.

IF A MAN is right, he can afford to go ahead full steam. To be right means mainly to be in tune with Destiny, and willing to obey. It does not necessarily mean to be agreeable, nor to be agreed with, nor to be popular, but it does mean to be useful in the purpose which Destiny is trying to achieve. If a man is right, he need not fear about standing alone. He is not alone. If he seems to be, it is only a test of his mettle and sincerity. Every idea that is right has many silent adherents. Raise your voice and you will hear them coming. Destiny is kind; it never asks a human being to do anything alone.

Now, when you look at this from another side it is a mighty encouraging thing. Some day there may come to you the duty to do a disagreeable task, to take up a cause which will yield you no reward, which will at first envelop you in misunderstanding and abuse, which will make you look like a fool before men. You will shrink from it naturally, yet if you are the person selected for the task, some way it will make itself known to you as a serious proposition regardless of your likes and dislikes.

The appointed task may be less to your likes than you expected. A man's real work is not always what *he would have chosen* to do. A man's real work is what *he is chosen* to do. There is all the difference between *choosing* and *being chosen*. Sometimes our choices are our destruction.

But when you are sure of what you have to do—and unselfish sincerity, simple willingness to do what is right are the only compasses by which you can be sure—then you may also be sure of this: *you are not the only one.*

Others have been notified and called out too. But maybe not to initiate the work. Maybe just to form the silent background, the receptive soil for the effects which your work will bring about. No man ever stands alone in any cause, if it is a righteous cause. When he calls, his voice will be heard and answered. He will be made aware by a thousand means that what he trembled before as a stern, forbidding task, is really the silent interest of many people.

There is a great deal of nonsense spoken about "the lonely heights." They are not lonely, though they may be silent. The loneliness comes when a man settles within himself whether he is to be a mere form following a conventional routine, or whether he is to listen and obey the voice of changeful life. It is lonely for him while he is deciding. If he decides to do what duty bids him, then he is no longer lonely; he comes at once into the fellowship of all liberated souls. The only liberated souls are those dedicated to perpetual obedience.

Most of us will never get fame. In a way this is to be regretted, for if we could get it we should know how well-off we are without it. Most of us will never shine as the captain-leader of great movements; but the real success and achievement of life is to be one of the foot soldiers of those great silent movements which, like the motion of the sea, keep humanity from stagnation.

Unknown America—Looking Over Lookout

By HARRY BARNET

THE guides who have escorted you who have visited the famous battleground, have had little to say of the wonder spot that stretches for eighty miles and of which there is much to be told. It's really one of the picturesque bits of Unknown America.

WITH but few exceptions, tourists who have clambered over the rocks and soil where the "Battle Above the Clouds" was fought on Lookout Mountain will doubt the statement that if you follow the trail leading off to the south from the battle spot, you continue atop the mountain for eighty miles, through what is, perhaps, one of the most picturesque parts of the South.

"It can't be done," any one of these doubters will tell you, "because I saw all there is to be seen on Lookout Mountain in one afternoon, and I certainly didn't walk eighty miles in that time."

There you have a difference of opinion that is entirely honest. Lookout Mountain, and what popularly is known as "Lookout Mountain," are artificial divisions of the same height. The latter is the battleground, and it has been so thoroughly press agented as "Lookout Mountain" that before tourists come to see it they are prepared to believe by all they have read and heard about it that Lookout Mountain is nothing more than an impressive bluff overhanging the Tennessee River, or a dull-tipped peak, rising abruptly out of epic country. And when these tourists leave the national shrine they carry that notion away with them.

It is the natural thing for them to believe. No one has made it very plain that where the spectacular fighting took place on Lookout Mountain is only the jumping-off place on the north end of an elevation that is one of the geologic mysteries on the continent, and that back of this jumping-off place there is a world of thrills for whoever is of a mind to indulge his taste for adventure. On the subject of the mountain itself, press agents have been strangely silent.

The outline of the mountain also has had a great deal to do with the creation of a wrong impression. It is a grotesque mass, shaped like a man lying upon his back, with his face turned squarely toward the sky. The attitude of the body is restful. The head is in Tennessee, and apparently it is pillowed upon the right arm, because there is nothing more than a faint bulge where the right arm should be. The left arm is thrown carelessly toward the east.

It is a curiously shaped head, if you stop and study it for a moment, that begins at the toe of the moccasin outlined by the Tennessee River southwest from Chattanooga. From the river bank there is a gradual upward slope, as though the skull is peak-shaped, and the rear half of it is buried in the earth. On the slope there are houses and trees, an unusually good automobile road, a street car line, and about the middle of the slope there is a railroad tunnel through it. Near the front hair line the skull rears straight up, and forms a monstrous jagged-rock bluff. This is the forehead; and it was up the side of this bluff, and across the face of the hulk, that the "Battle Above the Clouds" took place. If you are more interested in the ground that was fought over than you are in what may lie away from it, then you undoubtedly will believe from what you see that Lookout Mountain is a bluff that was made sacred by the men of yesterday.

Winter in the Lookout Mountain country.

In the length of Lookout Mountain there is but one place from which a view is possible into the valleys on both sides at the same time. That is on the neck, opposite Rising Fawn, Georgia, a small village at the foot of the western slope. Here, again, the temporary closing in of the mountain is likely to give the impression that the battleground is a peak. The body widens gradually into a plateau, seventeen miles long and from eight to twelve miles wide. The hips are opposite Ft. Payne, Alabama, also located at the foot of the western slope. The thighs and legs are normal. The right foot is thrust impudently into the outskirts of Gadsden, Alabama, and the left dangles in the waters of Coosa River. The mountain lies in a southerly direction, and between scalplock and heels its length is eighty miles, unbroken and extending into Georgia and Alabama. The line separating these states follows a fairly straight path about midway the east and west brows of the hulk. The average height of the elevation is about 1,300 feet above the surrounding country.

Around the brow of the mountain there is a broad band of rock that has the appearance of a smoothed gray ribbon, tied about it to keep it from falling apart.

"An' that 'ar ol' rock band, hit goes pret' near clean 'round that 'ar ol' mountain, hit does," is likely to be the preface to the first bit of native legendary explanation you'll hear about things on Lookout Mountain, if you're lucky enough to fall in with Jim Alread as a fellow vagabond on its surface.

While Jim is a mountaineer of the type that is familiar in fiction, he is exceptional to the extent that he will talk, and do it a-plenty at any time. Nearly every other he and she highlander that I've seen any place in the hill country of the South appears to be of an economical turn of mind, and holds fast to the opinion that making talk is a sinful waste of time and words.

"Sometimes I think I know a leetle reeligion," old "Uncle Burrell," who lives neighbor to Jim, said one day, "an' sometimes th' way other people say hit, why, I think maybe I don't know very much about hit.

"But th' way I think about hit," he went on, "th' Lord, He give a man one tongue t' talk with, an' two ears t' hear with, didn't He? An' hain't hit fer t' hear twice as much as y' talk?

"Ef hit hain't," continued "Uncle Burrell," satisfied with an affirmative nod that his explanation was understood and agreed to, "ef hit hain't, why, then a man 'ud hev two tongues an' one ear, wouldn't he?

"Now, that 'ar ol' Jim, ef y' didn't see him, an' only heerd him, y'd think he had two tongues, an' only one ear."

Jim is especially loquacious when he is on his way from the vicinity of a moonshine still. Then he jumps high into the air, cracks his heels together, and announces himself as, "th' he hawg 'v th' Cumberlan's, an' strong 'ith th' pow'r 'v th' Lord." About that time it is the wise thing to do to take a seat that has a tree between it and Jim; he is likely to be reckless, and shoot in any direction just to see folks step lively.

But this is not the story of Jim.

"An' th' ol' devil, he done hit," is the next statement that Jim makes in this, his favorite story, concerning the smoothness of the rock band that is around the top of Lookout Mountain.

"Now, Jim, you can't tell me that, you know," never fails as usher for whatever narrative there may be playing hide-and-seek near the end of his tongue.

"He shore did hit," is the impatient reply. "That 'ar dad-bummed ol' coot, he made that 'ar ol' rock band smooth, he did hit."

"Sure enough?"

"Shore nuf, he did hit," Jim goes on. "Them 'ar ol' rock bands, they war all rough an' scraggly, they war, an' pow'rful onhandy lookin', an' one afternoon that 'ar ol' devil, he said t' hi'se'f, 'I kain't stand a-lookin' at 'em that 'ar ol' way no longer, I kain't,' he said, an' he begun a-trimmin' 'v 'em, he did, an' a-puttin' 'v them 'ar ol' trimmin's in his apron which he war a-wearin', he did.

"Now, hit war a pow'rful warm afternoon, hit war, an' that 'ar ol' devil, he got th' notion, he did, that he wanted a long drink from th' Ohio River, which hit is a long way off yonder beyond Kaintucky, an' which hit war then all level land betwixt hit an' here. So that 'ar ol' devil, he jumped off 'v that 'ar ol' mountain, he did, a-flyin', he war, 'thout a-takin' off 'v that 'ar ol' apron 'v his'n, that 'ar ol' devil he did, an' when he got up thar 'bout th' Emory River, why, his apron string, hit busted, hit did, an' them 'ar ol' trimmin's, they begun a-fallin', they did, but that 'ar ol' devil, he war a-goin' so fast, he war, that them 'ar ol' rock trimmin's, they war jest tumbled all over Tennessee an' Kaintucky, an' clean t' Cincinnati, they war, an' not all in th' same place.

"Whooee!" Jim always exclaims in conclusion when he tells this tale, "but that 'ar ol' devil, he war a-flyin', shore nuf, he war, fer his drink 'v Ohio River water, an' that's whar all them 'ar ol' mountains betwixt Cincinnati an' Chattanooga, they come frum; they're th' trimmin's off 'v Lookout Mountain."

Soon after you've started on this trail that leads south from the battleground, you'll have no doubt about Nature being a wanton with her handiwork on Lookout Mountain. Later on, you'll begin to wonder if the lady didn't use the place as a studio, where she tried out color schemes, and put together astonishing combinations and distortions of heavy materials as models there before she did very much work any place else. For Lookout Mountain has in miniature a good many things that other places have in magnitude; and it has some things that evidently are patterns from which no duplicates have been made. But Nature kept a disorderly workshop, and never yet has found time to do very much cleaning up in it. Over here, she made reality of an idea that could only come during a spell of nightmare, and dropped it to work out off yonder a notion of beauty, and dropped it in turn when her nimble mind visioned another contrasting creation, until these things are spread over the whole of the top side of Lookout Mountain in a way that must give the creeps to our prim brethren whose conceptions of beauty are straight-ruled by regularity.

This variety crowd dots a surface that is badly gnarled. There are hills and valleys, and plateaus and plains on Lookout Mountain that give to it something of the appearance of a composite relief map of scenic America. Three rivers that have their sources near the upper part of the body of the mountain do their part toward taking the places of the trio of nationally important waterways on this fanciful relief map. These streams meander near to one another toward the south, until they reach the hips, where they join, and continue as one river. Just below their junction this stream that is formed by the combination of three rivers falls over a precipice. During mountain flood times the falls are nearly as wide as the American side of Niagara Falls.

But what is of more interest to the explorer is the fact that he or she can travel over Lookout Mountain in any sort of a fashion that has the greatest appeal—afoot, in an automobile, on horseback, or in a horse-drawn vehicle that is reminiscent of gay-young-blood days not very far in the past. The elevation is inhabited, but thinly settled, by a quaint set of folk, and they are strange human documents to ordinary din-jaded, white-light-blinded people from the city. These people of the mountain have some good roads that branch off from the trail that runs a southerly course from the north end of Lookout Mountain to the south end of it. Other roads are not so good and still others are mere ways through virgin forests, and along the edges of savage, timber-bristling cliffs. Of course, to get back into extreme primitiveness and wildness there is no other means than walking. Camping places on the mountain are as plentiful as little pine bushes.

Seeing what is to be seen on Lookout Mountain is largely a matter of living with your eyes wide open in any sort of a make-believe world that you're of a mind to wander through for the time, and the enticement of it is that you can change your mind and your environment without going very far to do either one thing or the other. Coming out of a virgin forest that is carpeted with amazing flora, you step directly and without preparation onto the edge of a rock field that is horribly naked reality. And you not only do this once, but you do it a dozen times, if you follow the main trail, and the trails that branch off from it, to their ends. These fields are rocks that seemingly bubbled, and boiled, and flowed, and covered hundreds of acres with an uneven, and cavern-hollowed scum before they hardened into gray-white plains. Their appearance is a riot of desolation, heightened by spurts of pebble-pitted rocks, haphazardly rearing aloft. A good many of these uprearings are larger in bulk than ordinary dwelling houses, and the impression they give is that of tormented souls reaching out in agonized supplication from a hardened hell. And in what seems to be an extra effort to repay you for the trouble in getting to these rock fields, other outcrops in the likenesses of nearly every variety of loathsome reptile apparently are slinking across the surface in a crafty effort to make prey of you.

Across this gruesomeness there are tiny flecks of color and brightness. The winds have carried small heaps of soil from one place to another and lodged them in depressions. Germs of dwarf pines and of rock-crawling plants made their way into these heaps and took root. There they struggle with forlorn determination to live, one beside another—gay patches of multi-colored mosses, clumps of evil, yellow-blossom

(*Concluded on page 15*)

Rugged Beauty

1. The Lookout Mountain of the tourists. 2. A native. 3. A winding roadway. 4. Cascades along Little River. 5. An uprearing in the rock field. 6. De Soto Falls. The caverns during prehistoric times were fortified strongholds. 7. View from Tennessee River, showing the slanting skull formation of the man-shaped mountain. The "Battle Above the Clouds" was fought up the face of the incline, and across the top of the bluff.

The Jewish Demand for "Rights" in America

Drawing a Parallel on Jewish Ideas of What Constitutes "Rights." The Basis Is Racial, Not American; Ten Special "Demands."

DURING the twelve years of its existence the New York Kehillah has grown in power and influence until today it includes practically the entire Jewish population in its operations. Among its direct or affiliated leaders and supporters are the owners of powerful newspapers, officials in the state, Federal and city administration; influential officeholders on public boards, such as the department of health, the board of education and the police department; members of the judiciary; financiers and heads of banking houses, mercantile and manufacturing establishments, many of which exert a controlling influence in certain industries and financial combinations.

But the New York Kehillah is more than a local organization. It is the pattern and parent Jewish community in the United States, the visible entourage of the Jewish government, the dynamo which motivates those "protests" and "mass meetings" which are frequently heralded throughout the country, and the arsenal of that kind of dark power which the Jewish leaders know so well how to use. Incidentally it is also the "whispering gallery," where the famous whispering drives are originated and set in motion and made to break in lying publicity over the country.

The people of the United States have a deeper interest than they realize in the New York Kehillah.

The liaison between this center of Jewish power and the affairs of the people of the United States is made by the American Jewish Committee. The Committee and the Kehillah are practically identical as far as the national Jewish program is concerned. It may be added that through their foreign associations they are also identical as far as the world program is concerned.

The United States is divided into 12 parts by the American Jewish Committee. The remark that this division is after the Twelve Tribes of Israel may be disregarded. Suffice it to say that every state belongs to a district, and that District No. XII includes New York, and that the District Committee of District No. XII is chosen by the New York Kehillah, and is by weight of wealth, authority and continuous effort in behalf of Judah justly recognized as the center of Jewish power in America, and it may be in the world also. This committee, some of the names of whose members are impressive, represents the focusing point of the religious, racial, financial and political will of Jewry. This committee, it should be remembered, is also the executive committee of the New York Kehillah. New York Jewry is the dynamo of the national Jewish machinery. Its national instrument is the American Jewish Committee.

A Perfectly Harmless Program—But!

THERE are certain announced purposes of these associations, and there are certain purposes which are not announced. The announced purposes may be read in printed pages; the purposes not announced may be read in the records of attempted acts and achieved results. To keep the record straight let us look first at the announced purposes of the American Jewish Committee, then of the Kehillah; next at the line which binds the two together; and then at the real purposes as they are to be construed from a long list of attempts and achievements.

The American Jewish Committee, organized in 1906, announced itself as incorporated for the following purposes:

> 1. To prevent the infraction of the civil and religious rights of the Jews in any part of the world.
>
> 2. To render all lawful assistance and to take appropriate remedial action in event of threatened or actual invasion or restriction of such rights, or of unfavorable discrimination with respect thereto.
>
> 3. To secure for the Jews equality of economic, social and educational opportunities.
>
> 4. To alleviate the consequences of persecution wherever they may occur, and to afford relief from calamities affecting Jews.

It will thus be seen to be an exclusively Jewish program. There is nothing reprehensible about it. If it meant only what it said, and was observed only as to its ostensible purpose, it would be not only unobjectionable but commendable.

The charter of the Kehillah empowers it, among other things, to establish an educational bureau, to adjust differences between Jewish residents or organizations by arbitration or by means of boards of mediation or conciliation; while the Constitution announces the purpose to be:

> "to further the cause of Judaism in New York City and to represent the Jews in this city with respect to all local matters of Jewish interest."

Where the American Committee and the Kehillah join forces is shown as follows:

> "Furthermore, inasmuch as the American Jewish Committee was a national organization, the Jewish Community (Kehillah), of New York City, if combined with it, would have a voice in shaping the policy of Jewry *throughout the land.*
>
> 1. It is expressly understood that the American Jewish Committee shall have exclusive jurisdiction over all *questions of a national or international character* affecting the Jews generally.
>
> 2. The membership of the American Jewish Committee is to be increased, so that the Twelfth District shall have allotted to it 25 members.
>
> 3. These 25 members are to be elected by the Jewish Community (Kehillah), of New York City.
>
> 4. These 25 men shall at the same time constitute the Executive Committee of the Community (Kehillah).

Jewish Exaltation of New York Ideas

IT WILL be seen, therefore, that the Kehillah and the principal body of the American Jewish Committee are one. The capital of the United States, in Jewish affairs, is New York. Perhaps that may throw a sidelight on the desperate efforts which are being continually made to exalt New York as the spring and source of all the thoughts worth while today. New York, the Jewish capital of the United States, has also been sought to be made the financial center, the art center, the political center of the country. But its art is Aphrodite, Mecca and Afgar; its politics are those of a Judaized Tammany. Tell it not to the American Jewish Committee, nor yet to the Kehillah, but let all Americans know that most of the United States lies west of New York. The country has come to view that strip of eastern coast as a miasmatic place whence rises the fetid drivel of all that is subversive in public thought. It is the home of anti-American propaganda, of pro-Jewish hysteria, a mad confusion of mind that passes in some quarters as a picture of America. But America is west of the "metropolis"; New York is an unassimilated province on the outskirts of the nation.

As nine-tenths of all the Jews in the United States live in allegiance to organizations which look to the American Jewish Committee as their overlord, the influence of the New York Kehillah on the nation is not hard to measure. In every town, large and small, even where the Jewish community consists of a few, 30 or 75 souls, there is a leading Jew, be he rabbi, merchant or public officeholder, who is in constant touch with headquarters. What is done in New Orleans or Los Angeles or Kansas City is known in New York with surprising dispatch.

Incidentally, it would interest some clergymen to know that their names are listed among those who can be depended on to play the Jewish hand whenever required.

What Does "Jewish Rights" Mean?

NOW, the public statement of purpose on the part of these Jewish bodies has just been shown. It is seen that the protection of Jewish rights is the ostensible program—against which no one can say a word. Perhaps the term "Jewish rights" is unfortunately chosen. If Jewish rights coincide with American rights, then more than the Jews are protecting them—the whole American nation is engaged in that work.

But it is not true that "Jewish rights" are the same as "American rights." Unfortunately the Jews have adopted an attitude which could only have sprung from the belief that it is a "Jewish right" to Judaize the United States.

This is one of the dangerous doctrines being preached today, and most assiduously by Jews and those who have been influenced by Jewish thought, namely, that the United States is not any definite thing as yet, but that it is yet to be made, and it is still the prey of whatever power can seize it and mold it to its liking. It is a favorite Jewish view that the United States is a great unshapen mass of potentiality, of no particular character which is yet to be given its definitive form. It is in the light of this view that Jewish activity must be interpreted.

That doctrine with which so large a mass of Americans are inoculated is making havoc with the whole Americanization program today. It is "broadening" America out of all semblance to its distinctive self and blurring those determining ideals and ideas on which American institutions are based. The attempt, first to give the people to understand that the United States is "nothing particular" as yet, and second to make it something different spiritually from what it has always been, is peculiarly agreeable to the philosophy which sways the internationally-minded Hebrew. We are not making Americans; we are permitting foreigners to be educated in the theory that America is a free-for-all, the prize of whatever fantastic foreign political theory may seize it.

There you have the secret of the great refusal of the foreign population to change themselves into conformity with America; why should they, when they are taught that America may be changed into conformity with them?

It is time to limit our "broad-mindedness" until it will fit within the limits of the Constitution and the traditions which made America what it is—the desired haven, even in preference to Palestine, of the Jews and every other race.

So, then, what is this conception of "Jewish rights" which the Kehillah and the American Jewish Committee are organized to defend? It is only by deductions from the acts of these bodies that the answer can be formulated.

In the Jewish records for the year 5668 (1907-1908) we read:

> "Perhaps the most noticeable feature of the year in America has been the demand in certain quarters for *the complete secularization of the public institutions* of the country, *what may be deemed the demand of the Jews* for their full constitutional rights."

Let the reader notice that the only time he finds the religious note struck in this series of studies of international Jewish activity, it is struck by the Jews. Honest non-Jews have been nonplussed by the Jewish charge that any scrutiny of Jewish action is "religious persecution," even when religion has never been thought of or mentioned. The explanation is not far to seek. In the above quotation the religious note is struck at once: the "full constitutional rights" of Jews demands that we effect "the complete secularization of the public institutions of the country."

To Judaize America Is "Jewish Rights"

THAT is worth thinking of. But to continue the quotation:

> "Justice Brewer's article asserting that this is a Christian country has been challenged more than once, and the idea was formally combated in papers by Dr. Herbert Friedenwald, of New York, Isaac Hassler, of Philadelphia, and Rabbi Ephraim Frisch, of Little Rock, Arkansas.
>
> "The legal and theoretical argument was supplemented in a practical way by widespread opposition to Bible readings and Christmas carols in public schools, an opposition specifically decided upon by the Central Conference of American Rabbis.
>
> "In New York the agitation against the carols produced a counter-demonstration in their favor, and the matter seems to have been left to the discretion of the individual teacher.
>
> "In Philadelphia, Cincinnati, St. Paul and maybe elsewhere, there were similar movements and counter-movements, and the question may yet return to plague us."

There you have, in officially authorized Jewish statement, what the Jews conceive to be a part of their Jewish rights.

A careful examination of the intensive propaganda conducted by the Kehillah and the American Jewish Committee will not only reveal that the whole United States is considered to be the legitimate field for Jewish interference, but also that a very wide diversity of "rights" is insisted upon by them.

In dozens of states and hundreds of towns and cities this program has been plied, but always with too little publicity to appraise the people what is going on. In any number of cases the Jews win their contentions because of the local pressure they are able to produce, usually by their very forehanded way of selecting and obligating public officials. In other instances they have lost, but every loss they credit to a beginning of their "educational" campaign. A loss enables them to "teach a lesson" to somebody by means of a boycott or a changed attitude on the part

of the local bank, or in some other way equally effective in creating "the fear of the Jews."

The Jews have evidently convinced themselves that the Constitution of the United States entitles them to change the character of many of the time-honored practices obtaining here, and if this is true, American citizens should take cognizance of these things and prepare to adjust themselves to further changes. If they do not take kindly to further changes at the behest of Jewry, they owe it to themselves to know what the Jewish program is, that they may meet it with a higher type of weapon than that to which the Jew naturally resorts.

It is intended in this and the following article to indicate, by the actual program, what the real objective of Jewry is in the United States. When you collect and summarize all the demands that have been made by the New York Kehillah alone, you gain an idea of what is afoot. A few of these demands are referred to now, subject to further illustration in another article.

Ten Years of Jewish Demands

1. *The unrestricted admission of Jewish immigration to this country from any part of the world.*

Heads of Kehillah labor unions in New York demand that the Jews in Europe be exempted from the operation of whatever American immigration law may be passed. The Kehillah is many times on record to this effect. No matter where the Jews may come from —Russia, Poland, Syria, Arabia or Morocco—they are to be let in no matter who may be kept out.

Note: As one pursues the study of "Jewish rights," the quality of "exemption" seems to appear in most of them. Nowhere do the Jews proclaim their separateness as a people more than in their unceasing demands that they be treated differently than any other people and given privileges that no other people would dream of asking.

2. *The official recognition by City, State and Federal governments of the Jewish Religion.*

The Kehillah in its reports describes its efforts to obtain special recognition of Jewish holidays, in some cases going so far as to demand the continuance of pay to public employes who absent themselves at Yom Kippur, at the same time opposing the continuance of pay to Catholic public employes who desired to observe the chief Lenten days. This is a peculiarly inconsistent form of the demand for "exemption" which has led to some interesting situations, to be dealt with later.

3. *The suppression of all references to Christ by City, State and Federal authorities, in public documents or at public gatherings.*

Kehillah records show that the Jews of Oklahoma addressed a petition to the convention which formulated the first state constitution, protesting that the acknowledgment of Christ in the instrument would be repugnant to the Constitution of the United States. The record also shows that a Jewish rabbi protested against a governor of Arkansas using "a Christological expression" in his Thanksgiving Day proclamation.

4. *Official recognition of the Jewish Sabbath.*

The educational, cultural, business and industrial life of the United States is regulated with reference to Sunday as the legal day of rest. For over 10 years the Kehillah has sought legislative recognition for Saturday. In the absence of official recognition, however, much public business is held up on account of jurors and others refusing to serve on Saturday. Jewish lawyers in the trial of cases are frequently "ill" on Saturdays. There is, of course, no objection to Jews recognizing their own Sabbath. This is their American privilege. But to make their Sabbath *the* Sabbath of all the people is another question. The Jews' chief objection to the observance of Sunday is that it is "a Christological manifestation."

5. *The right of the Jews in this country to keep open their stores, factories and theaters, and to trade and work on the Christian Sunday.*

The Kehillah, through the Jewish Sabbath Alliance (Rabbi Bernard Drachman, president), is "promoting the observance of the Holy Sabbath in every possible way," through propaganda made to promote Sabbath sentiment, and the distribution of circulars and pamphlets to the Yiddish populations of New York City. Sabbath sentiment is unobjectionable, but it becomes anti-Sunday sentiment. The Sunday laws of the city are, therefore, often broken. Much agitation and ill feeling result. Kehillah records are full of the disagreeable conditions which this demand promotes.

6. *Elimination of Christmas celebrations in public schools and public places, police stations, and so on, public displays of Christmas trees, singing of Christmas carols and Christian hymns.*

Kehillah compelled the Council of University Settlement in New York City to adopt a resolution that in holiday celebrations held annually by the Kindergarten Association, Christmas trees, a Christmas program for celebration and the singing of Christmas songs be eliminated.

Kehillah records show that Jews petitioned the Chicago School Board, demanding that sectarian teachings in public schools and the singing of Christian hymns be discontinued.

Also that at the demand of a Jewish rabbi, three public school principals were compelled to omit all Christmas celebrations and the use of the Christmas tree in public schools.

7. *The removal from office or prosecution of all public persons who criticize the Jewish race, even where such action is in the public interest.*

Judge Otto A. Rosalsky, member of the Kehillah, announces that he will try to put through a bill for the prosecution of all persons who criticize the Jewish race.

Kehillah leaders at public meeting condemn City Magistrate Cornell for criticizing the East Side Yiddish Community because of the increase in criminality of Jewish youth, and demand his impeachment.

Leaders of New York Jewry succeed in having Police Commissioner Bingham removed from office by the Mayor because of his criticism of criminality among Russian-Polish Jews of New York City.

Substitutes for American Institutions

8. *The establishment of Bet Dins, or Jewish courts in public courthouses.*

The Kehillah has succeeded in the establishment of a Bet Din in the Criminal Courts Building, New York, at which there presides the Rev. Dr. Aaron A. Yudelovitch, chief Rabbi of the United States.

Kehillah records show that prominent Jews of Jersey City, Paterson, Newark, Bayonne and Hoboken have organized to establish Bet Dins in New Jersey.

9. *The right to eliminate from all schools and colleges all literature that is objected to by Jews.*

Kehillah records show that Jews have prohibited the reading of the Merchant of Venice and Lamb's "Tales from Shakespeare" from schools throughout the country, including those in Galveston and El Paso, Texas; Cleveland, Ohio and Youngstown, Ohio.

At the present time a cleaning of public library shelves is proceeding in a number of cities to prevent the public securing books which public money has bought—the objection to the books being that they discuss Jews as they are. All works in praise of Jews are spared.

10. *Prohibition of the term "Christian" or the use of the phrase "state, religion and nationality" in any public advertisement, as being an invasion of Jewish rights and a discrimination against Jews.*

Louis Marshall, as president of the American Jewish Committee, obtained apologies from Charles M. Schwab, as director of the United States Shipping Board; Benjamin Strong, governor of the Federal Reserve Bank and head of the Liberty Loan Committee; Secretary McAdoo and Secretary of War Baker, because of the use of the term *"Christian"* in help wanted advertisements inserted in newspapers by their subordinates.

The Jews succeeded in obtaining the withdrawal of the Junior Plattsburg Manual, used by students in officers' training camps, because it contained the phrase "the ideal officer is a *Christian* gentleman," which the Jews construed to be an infringement of their rights.

The Kehillah in its report for 1920 stated that several important New York newspapers, having been informed by it that the term *"Christian"* had appeared in the help wanted advertisements of mercantile firms, the owners of the newspapers sent in their apologies, and promised stricter censorship in the future.

The Jews do not consider the use of the term "Jews" in help wanted advertisements as a discrimination against non-Jews, and Jewish mercantile houses continue its use in their advertisements in the New York *Times* and other Jewish-owned dailies.

Various Directions of Jewish Interest

THESE are "Jewish rights" as they are indicated by Jewish demands. But they are by no means all; they are merely typical of all the so-called "rights" and all the insistent demands.

To go still further: the Kehillah condemned the use of the term "Americanization," because of the implication that there is no distinction between "Americanization" and "Christianization." "Americanization" is claimed by the Jews to be a mere cloak for proselytizing.

The Kehillah is behind demands on public funds for the support of Jewish educational, charitable, correctional and other institutions. One important point about the great influx of Jewish immigration is that tens of thousands of these people come from lands where Jewish government has been established by order of the Peace Conference, and where public funds support Jewish activities. Their attitude toward America in this respect may therefore be accurately gauged.

It is a common practice in New York for the Jews to force themselves into juries which try Jewish cases. Jewish law students, with which the city swarms, "work their way through college" partly or wholly by jury duty.

Another "Jewish right" is that the Associated Press shall print what the Jews want printed and in exactly the tone the Jews desire. This is perhaps one of the factors in the loss of luster on the part of the Associated Press of late years, the feeling that it is too much under the influence of certain groups, which are not non-Jewish groups. Newspapermen all sense this; A. P. men throughout the country sense it; but they express it in newspaper terms; they say "The A. P. gives a New York coloring to everything." But the ingredients of the New York coloring are 85 per cent Jewish.

From a survey of the demands, these appear to be some of the "Jewish rights" which Kehillah and the American Jewish Committee are organized to secure. And how far they say they have succeeded, we shall next see.

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

Jewish spokesmen, supposing the American people to be ignorant, protest loudly that the Bolshevik leaders are not Jews. Now comes Paderewski, the latest arrival from the Soviet region of the world, and tells a New York *World* reporter: "Eighty per cent of the leaders of the Bolshevik movement in Poland have been Jews. The mass of the people therefore jumped to the conclusion that all Jews were Bolsheviki. That is always the trouble with masses of people, is it not?—the tendency to generalize too much. During the Bolshevik drive on Poland there were regrettable incidents. But the enmity cannot go on."

An idea of how the "American Peace Delegation" to the Peace Conference at Paris impressed the French people may be gathered from the fact that so comparatively unimportant a figure as Rabbi Stephen S. Wise is represented by Frenchmen as being "the vice-autocrat of the United States." The French people noted the deep Judaic dye of the American delegation, and the activity of certain Jews from America, and drew their own conclusions. But they are wrong. The crowd that flew so high in Paris is rather out of it now.

Mendel Beilis, writing to the New York *Day*, says that after his trial for "ritual murder" the Jews of America and Mexico (so he writes it) sent 21,000 francs that a homestead in Palestine might be purchased for him, and that the Jews of Danzig, Berlin and London added 20,000 francs more. He says he has received none of this. During the war the Baron Rothschild fund paid him 1,000 francs a month. Nevertheless he says he is heavily in debt, pestered by creditors and in great distress through poverty. He proposes to come to the city of Philadelphia where he says he has relatives.

Rabbi Rudolph I. Coffee, in a recent editorial, outlines instruction for Christian Sunday schools. He says; "Teach Christian boys and girls that Jesus was a fine Jew, who lived an upright Jewish life, and was put to death by the Romans because he professed the finest Jewish idealism."

Lord Reading, who is Rufus Isaacs, is about to complete the Jewish rule over India by taking the last high office left unoccupied by a Jew. His departing speech in England was to advise the United States to enter the League of Nations.

The Jews of the United States have asked President Harding to appoint a Jew as American ambassador to Germany, thus to convey a hint to the Germans to stop objecting to Jewish rule over the remains of the German Empire. Mr. Harding is understood to have taken the position that he will promise no diplomatic posts until after the Secretary of State has been selected. The Secretary of State is, at this writing, supposed to be Charles Evans Hughes, and there is no assurance that a Jew will not be appointed to slap the German people's face. The Jews have used the diplomatic service of the United States on previous occasions, and probably do not see the impropriety of their present demands.

Gilbert K. Chesterton, the noted British author who is lecturing in the Unied States, is being attacked all along his route by Jewish rabbis because of his alleged "anti-Semitism." Chesterton says it is the purest Semitism.

Samuel Gompers, Jewish head of the American Federation of Labor, has appeared against the proposal to pass a censorship law for movies in New York.

Speaking of anti-Semitism, the Berlin Government has appointed Professor Sobernheim as special advisor of the government council on Jewish affairs.

The Mystery of Woodrow Wilson's Reverses

Concluded from page 3

That lasted a few months. The conferences ended abruptly on the plea of Mexican complications, but in reality due to the inquisitiveness of one of the ablest newspapermen in the country—one known to be a favorite, by the way, of President Roosevelt. He was an expert on foreign affairs and his familiarity with the subject enabled him to submit questions to President Wilson that the latter at once sensed as being perhaps impudent. Personally, I believe Mr. Wilson was unable to answer because his knowledge could not have equaled—not at that time anyhow—that of the interviewing correspondent.

Those conferences were picturesque scenically. Intrinsically, they were useless. Only a futile question was sure to bring an answer. These were submitted as a rule by correspondents newly arrived and impressed by the fact that the President of the United States confronted them in readiness to answer, maybe, some question, but conditional upon his not being quoted. Before long the best correspondents at Washington—the old-timers—began to skip the conferences, and in view of the fact that the assiduous callers did not look very prominent, the conferences died by innocuous desuetude.

Nothing I can think of leads me to believe that when President Wilson entered the White House he had an abnormal or exalted position of the office. In fact, I believe that in his heart's depths he promised himself some sort of a change; the kind he frequently spoke about in those days but which never materialized; the ardent hope to make of his office the final clearing house between the people's wishes and best interests and the inexorable world waiting outside. That was his theory, regardless of what took place in practice. Unfortunately, the plan he had in mind was not one that could be performed as a miracle, and its success depended upon his immediate entourage.

His entourage, with an exception here and there, did not consist of idealists like him. They were newcomers, who descended upon Washington like the vanguard of a victorious army. Washington to them was a new Bagdad; a stroke of the presidential pen and all the wealth of the Indies lay at their feet. Out of that arose that sense of false glory that little by little began to envelope like a perpetual fog, the White House.

When He Wanted to Forget

THAT Mr. Wilson fought this miasmatic atmosphere he himself admitted. "There are blessed intervals," he explained apologetically, as if seeking to reason out what he did not understand, "when I forget by one means or another that I am President of the United States."

That is one of the saddest admissions ever made by mortal man; the more so because sincere. But Woodrow Wilson was no longer his own master; it is true that the office of President at times interfered with his own personal inclinations, but it was not the etiquette of the office that plunged him into the lonesomeness that in due time paved the way for autocracy, but the unctuousness and flattery and perfervid attitude of those party assistants with whom he came in direct contact every day many times a day. Their campaign was by indirection; had they dared openly to reveal their blandishments and flunkeyism he would have cast them from him like lepers. This chicanery may be difficult to excuse, offhand. But it is easy to place. It was not done as a compliment to the President *per se,* but for the benefit of that reflex glory that would radiate upon them.

Like poor men who always speak of riches, and failures who always regard success with awe, the President's favorite topic, "when himself," was about "being human." Mr. Wilson has been human enough, subject to atavistic limitations. He was often condescending, which he mistook for being human. He suffered this or that person and thought he was being sympathetic. It has been very difficult to find him at his natural best and his artificial cleverest. But one or two outstanding instances may be cited. When he received Harry Winthrop Davis, a nine-year-old boy suffering from a weak heart—an ailment that invalided him—he was at his best. Master Harry spent most of his time in a reclining position. He had a great longing to shake hands with President Wilson, whom he regarded as an idol. This yearning was made known to Mr. Wilson, who received Master Harry, spending several minutes talking to the little fellow and patting his hand. Last year, shortly after the election, he received a fifteen-year-old Washington girl, who had made a collection of Wilsoniana and was very proud of her scrapbooks. It is said that the miss wrote to the former President while he was in Paris, praising his work and hoping for his success—a letter that was acknowledged and that was followed by a personal interview. These were the days when public men could not see him. Thus there rises a doubt, not of Mr. Wilson's motives, but those of his intermediaries.

How His Illness Was Handled

MR. WILSON'S illness was adroitly manhandled by politicians with more than the President's own sake to serve. It gradually led to a sort of maudlin sympathy on their part, which in due time became reflected in unsuspecting or indifferent quarters. As a result the phrase "jumping with both feet on a man when he is down and out" made, in varied form, its appearance throughout the political strife of the nation. The opprobrium of implied cowardice was always directed against the few objectors, dissenters, opponents and what not, centering with due force upon a few outstanding personalities of independent thought. The general feeling at the Capitol was that so long as the official was strong enough and active enough to remain unyielding in his official acts and wishes, the nature of "helplessness" was of doubtful degree. They have pointed out to me that Woodrow Wilson remained a no mean adversary or champion, as the case may be, throughout the time of his ill health.

Statesmen, therefore, dealt directly and otherwise with no imaginary President; the latter's influence was constantly in evidence. He smothered, with the exception of the Senate, every antagonistic influence. To them the sick man was a theory.

They had no choice, as between conflicting and inconsistent reports between a "man down and out physically" who, according to bulletins, was not very ill, and the aggressive personality they encountered at every move.

Becoming Stubborn and Suspicious

EVEN at this late day Mr. Wilson's illness is pointed out as warranting a different conduct on the part of unbelievers. But who is to blame if the country at large eventually agreed with the overemphatic protestations of the White House that the President's illness was greatly exaggerated and thus refused to show any undue sympathy toward the Executive? Someone slipped somewhere. That Mr. Wilson has been a sick man no one can doubt, and a few know; he has been sick now for a year and a half. But who is guilty of bad taste, a tricked public or those who used the illness for the purpose of political propaganda? And so far as newspaper correspondents have learned, the people's temper did not sweeten upon the realization that an unofficial circle of mixed individuals in every probability ran for a time the executive government of the United States.

These are facts or comments upon facts. Criticism does not belong here. Just now the question is that Mr. Wilson has passed from the most important public office in the world not only a beaten man but an unliked man, more on account of his friends than his own acts. Atavism has made him stubborn and suspicious. For years he feared the office seekers. He erected first a mental barricade to protect himself against them; the war added the iron fence. But the office seeker was not eliminated except bodily. One need but to think of the thousands of extra appointments he was obliged to make during the war. Any one who met Mr. Wilson even for a few moments must have left him convinced that he would be the unhappiest man in the world if he had personally selected some of the men whose names were placed before him for appointment. For the mass of mediocre officeholders one has to imagine the probable go-betweens. Gossip mentions most prominently four or five names.

Mr. Wilson stood by those he terms his friends, although among these were many responsible officeholders—or, rather, holders of responsible office—that the President quite likely did not know before he went to the White House. These so-called friends he stood by through thick and thin; a nation turned against them but he stood between the proletariat and their salary. Incompetence, waste, extravagance, discrimination, separately or together, were permitted to go on in the face of public indignation. And the President paid! He paid to the utmost of man's ability next to death. He lost his health and lost his fame, merely in his blind belief that his assistants were the right men for the office. It is quite unlikely to find similar devotion on the part of any one man toward his co-workers.

If it were a matter resting solely with the American people, the passing of Woodrow Wilson would be much less tragic than it actually is. By injecting himself in the European arena he gave foreigners a grasp upon criticism.

Europe Will Not Forgive

THE United States, thanks to its magnificent way of renewing and revitalizing its government quadrennially, despite some minor defects, purged itself of an undesired administration at the elections and will let it go at that. Europe, however, will be less forgiving or less relenting as the case may be. Europe, regardless of all else, is in turmoil on account of the League of Nations, not because it may not be all that is desirable, but because it was not acceptable in the manner and method insisted upon by the President, at a time when statesmen overseas thought they had no choice in the matter. And Europeans feel vindictive. They have never had much love for Mr. Wilson and they dislike him intensely now. One thing is assured; Woodrow Wilson's vulnerable point will be historically—and that is where he will be attacked.

Fame during the war was largely artificial. It has given no outstanding figure. A few seemed from time to time comparable to this or that historical figure, but the armistice, with its accompanying relaxation of the world's mind, and an easing up on front-page headline position, largely mistaken for fame, is giving away to an unmistakable sense of forgetfulness, or something akin to it. There has been a plethora of newspaper front page popularity, which in reality was no more enduring than the current value of any given issue. This may be the better understood when it is pointed out that a combination of all the printed matter of any one day during the war, throughout the world, on any one personal item easily exceeds all the enduring prints of centuries about any famous character of ancient times.

Fame attaches to a public man when he is either deified or when bitterly hated. Mr. Wilson left office in the midst of general indifference. This sort of indifference experience has taught as being disastrous to popularity, when it originates by collectivity and not groups. It includes the entire world; not a section of the United States.

It would be difficult, and probably is impossible, to find a sign of bitter hatred against Woodrow Wilson; I have tried but failed to discover it. Antagonism toward him has been of peculiar nature; a compounding of negative emotions with no predominant characteristic. In the same measure it is equally difficult to find any one who greatly loves him; by this I mean the unfavored or protected individual; your average plodding citizen. He is unknown to his fellow man; the few graphic sketches existing of him, which he has repudiated as spurious, have been lost in the shuffle or concealed behind the glittering mass of posed and therefore unfaithful descriptions of the man. In fact, even more has been done. An ambitious and young newspaperman achieved unusual success on the pretension that he interpreted the President's mind; a preposterous banality, for his only claim to attention was his recipience of news in preference to many other reporters.

Mr. Wilson has been pleased to say that he has mixed, first and last, with all sorts and conditions of men; that there are mighty few kinds of men that have to be described to him, and there are mighty few kinds of experiences that have to be described to him. That belief has really been his undoing. The man who has mixed is easily understood; what he says and what he means requires no interpretation; and the country, somehow, instead, has felt that Woodrow Wilson spoke to supermen. Their common language was the same but the understanding differed.

A Jekyll-Hyde Personality?

SO, UNABLE to understand his own people, he passes with the conviction that he has not been understood. This conviction is aided by the ease with which the few immediately about him have agreed with him, and which he has felt is "understanding." But I very much doubt their implied superkeenness of intellect. And I gravely doubt if those that he has befriended most, however indirectly, will yield future unstinted appreciation. The more remote ones are already showing signs of ingratitude.

In fact, those who can be depended to remain loyal to him are the very men to whom he was unjust. There are several such men who suffered the bane of his displeasure, sometimes directed against them with cynical discrimination. Why? Because those are among the few real men of his administration; your true officials and public servants; the men who looked upon their office in the light of patriotic duty and not as salary grab; men of circumspection, impartiality, willing to and making allowance for human frailty.

If those men ever will reveal their innermost thoughts it will be to uphold Woodrow Wilson in every way, even in his mistakes. I know of one who confessed that he regarded the President as a sort of Jekyll-Hyde personality, and that the latter state was manifest at the instigation of not disinterested others, who had the peculiar influence of rallying him to their side against the whole world. By some insidious manner they convinced him that they were holding up his hands.

It was clever propaganda. It has no counterpart in civic government in this country. It made the ablest men victims, which is easy to explain. During the first year or two it became at once evident that the President, realizing that his office was not a one-man affair, and that he could not be the spokesman of the people as an individual, would be obliged to depend upon the men he had chosen to work with him. It was the stage leading to popular government. Quite naturally the ablest men would not tolerate any state of affairs which would give incompetence the upper hand. They fought the incompetents. But incompetents outnumbered the competent a hundred to one. The competents' finish was obvious. It was a case of the survival of the most numerous—and they survived.

If Woodrow Wilson could telescope from public attention the artificial self so prominent for eight years, the people might accord him a sympathy not otherwise possible. He has not been the victim of his opponents, as he has often hinted and as his coadjutors have insistently charged, but of his own friends, or those who have passed for such. They facilitated the growth of his obnoxious second personality, which probably has become so fixed a habit as to have become real. Seven years ago he petulantly voiced his desire to disguise himself, that he might feel "at one with the people" about him, unaware that he was already disguised, and that his confession indicated the clash of his real self for a means to free itself of the mask smothering it.

The Public's Fear Unallayed

THE last election was the common fusing together of various and varying states of popular mind. It found one common object of protest: Woodrow Wilson. This attitude on the part of scattered and even unwilling millions of people has not just happened. It was the reaction from the fraud committed upon a trusting public by a few politicians who have done more to destroy Woodrow Wilson, the personality and the man, than all his own mistakes of omission and commission.

It was the revolt against what may well be termed the Wilsonian oligarchy, consisting of a handful of individuals, thriving under the master's blind benevolence. But thanks to the American form of government, which renews and occasionally purges itself every four years, or is intended so to do, these politicians were unable to perpetuate themselves even after their deplorable intrigues. It will be possible in the future to reach a basic and acceptable view of President Wilson's place in history, but bearing no relation to the place accorded to him at present. The same cannot be said of his favored co-workers. Judgment is inexorable in their regard.

This, in conclusion, can be realized and understood ever so much better when one considers the anxiety and apprehension of the people with regard to President Harding's reported sympathy with certain of his predecessor's ideals. It is not the fact that the latter might be found justifiable, but the terrible fear that it would imply recognition of those officials who would find in it an opportunity for their restoration to public office.

The Crime of the Cities

St. Paul—By EARL CHRISTMAS

NEXT to the immensity of the task itself—and that is one of the staggering things about prohibition—enforcement of the Eighteenth Amendment has revealed that most of the violators are persons of foreign descent.

Take the experience of St. Paul, Minnesota, for instance. St. Paul is a normal, mid-western city, with its average proportion of foreign-born population.

Yet fully 80 per cent of the violators of the prohibition laws are foreigners, according to William Anderson, assistant United States district attorney at St. Paul. Paul D. Keller, supervising enforcement agent for five northern states, declares that fully three-fourths of the offenders are foreign-born, and adds that most of them are not citizens of the United States.

Consider these names, taken in the order of their appearance on a list of indictments returned by the last Federal grand jury at St. Paul:

James Falkowski, Alex Removitsky, Victor Gangl, Joseph Glombitza, Peter Kiartkowski, Gust Gustafson, Philip Hecklin, Nathan Hernan, Louis J. Jamieson, Peter Kiibauch, Frank Kurkoske, John Olig, Peter Olig, Joseph Rosenblatt, Michael Sarofolean, Katolina Sarofolean, Mathias Schlosser, Antone Singer, Arthur Tennenbaum, Fred Magilevsky, Adam Wethke, Clinton Rogouski, Louis F. Kiichli.

If that doesn't sound like calling the roll of the nations—well, the prohibition officers are ready to throw up the sponge. Prohibition in the great American melting pot is fraught with difficulties, in other words. Persons of foreign birth are being assimilated perhaps, but many of them are not assimilating prohibition so rapidly, according to the men who enforce the laws.

"Yes, foreigners are causing most of our trouble," said Mr. Anderson, looking up from his puzzling list of names. "Particularly is this true of the moonshine cases. Serbians, Rumanians and especially former subjects of the Austro-Hungarian empire keep appearing in the lists of offenders. We have a lot of trouble, too, with former saloon-keepers, when it comes to selling."

Mr. Keller put it this way:

"I suppose many of these persons of foreign birth were used to having their own liquor in the old countries, and so may be lead more easily to break the law here to get it. Some of them don't know it's a serious offense. Then there is the lure of fabulous profits for those engaged in the traffic.

"We don't get the real men back of the traffic. The men we catch are usually the little fellows operating on a small scale or the men who are working for someone else. Their employers are bankers, merchants, retired business men and speculators, who are willing to risk their money in the traffic for the tremendous return."

But if a year of the Eighteenth Amendment has revealed that the foreign-born population provides a majority of the offenders, it has revealed more eloquently still the amazing complexities and the immensity of prohibition enforcement.

In the St. Paul division of the United States district court, including the city of St. Paul and seven counties in the vicinity, approximately 300 indictments have been returned in the enforcement of prohibition since July 1, 1919, when war-time prohibition first became effective.

Fully twice that number of arrests have been made according to an estimate by Mr. Anderson. At the December term of court alone, actions were started in approximately 100 cases, while the Duluth term of court opened in January with 250 cases on the docket. Approximately ninety cases are waiting trial at St. Paul now, and large numbers have accumulated at other cities in the state where Federal court is held.

Prohibition has added 1,000 cases to the yearly job of Alfred Jaques, United States district attorney for the Minnesota district. That practically doubles the work in this office. To handle this increased burden, one assistant United States attorney has been added to the force—one man to handle 1,000 cases. There are now three assistants.

St. Paul didn't know just how to take prohibition when the national act ushered in a dry era for the city. Minnesota had been used to its drink. It wasn't wet by any decided margin. In fact, a prohibition amendment to the state constitution, submitted at the general election in 1918, polled a total of 189,614 votes to 173,665, though it failed to pass, lacking a majority of the vote cast. In Ramsey County, including St. Paul, the vote stood 13,709 for and 16,610 against.

So, St. Paul as a whole wasn't ready for prohibition, judging from its expressed vote.

Prohibition came, and after the first few weeks of uncertainty, some of the saloons began dispensing drinks that could not be classed as soft. They did it slyly at first, more openly as time went on.

Then one day T. E. Campbell, special agent of the Department of Justice, then in charge of prohibition enforcement, started out his crew of investigators. They bought drinks in nearly all the leading saloons. Indictments against some sixty saloon-keepers and bartenders followed, the first big offensive against liquor selling. One county commissioner and several citizens prominent politically were caught. All pleaded not guilty, and began to wonder how much they would get. Finally, one man, by way of trying the water, changed his plea to guilty.

Judge Wilbur F. Booth fined him $100. Immediately, all sixty changed their pleas, and said they were guilty—for $100 each.

Of the eighty some men indicted at the December, 1919, term of court, 68 pleaded guilty. Three later were found guilty on trial. Five cases still are pending, and the rest were thrown out.

Everything went along fine until the June, 1920, term of court was well advanced. One hundred and ten men had been indicted. As the courts were endeavoring to straighten out the tangle of cases, a young attorney, George G. Chapin, made a discovery that has all but upset long months of work for the prohibition officers.

Chapin advanced the theory that a prohibition officer could not go into a home to obtain evidence without a search warrant. Judge Page Morris, then presiding, upheld him in this contention, and the indictment then before the court was marked *nolle prosequi*. Immediately the issue was raised on other cases, and other indictments thrown out. Many persons against whom evidence was obtained without search warrants were not indicted, but the cases were dropped.

Then in November Judge Booth ruled that the prohibition officer must have a search warrant before entering a soft drink parlor to obtain evidence of violation of the prohibition law. That resulted in additional indictments being thrown out. Altogether approximately fifty indictments were thrown out because of the absence of a search warrant.

"To get a search warrant now, we have to have proof of sale," Mr. Keller said. "The prohibition agent has to go into a place, buy a bottle of whisky, or see one bought, before he can get a search warrant. Then he can go back with the warrant and get the evidence.

"That makes it extremely difficult to get evidence against the soft drink places that sell whisky. They will sell usually only to the men they know, and in that way they are able to keep running even though we may know they are selling liquor. They never would sell to one of my men, perhaps.

"I don't know of another division where search warrants are necessary. In Chicago, they just go in and raid the places. In Iowa, we have no trouble like this at all. But here in Minnesota, the search warrant rule is putting a crimp in much of our work. I don't want to take the position of criticising the courts. Their construction of the law may be correct. But I think we ought to have freer reign."

Mr. Keller likewise pointed out that the machinery of enforcement is wholly inadequate.

"I have sixty men," he said. "They can't begin to perform the task. Sixty men—for five states. If I could keep them in one place, that would only be 12 men to a state, and perhaps two or three to a city like St. Paul. I ought to have 200 men to handle the job.

"The big trouble in prohibition enforcement is that not enough local officials are interested in enforcing the law. The national prohibition act provides for the establishment of a Federal enforcement agency to coordinate and supplement—not to supplant—the duly constituted police and judicial officers of the states. I have been trying to tell the peace officers that, but not many of them appreciate it.

"Why, there are 1,000 peace officers in North Dakota, and I get little or no co-operation. Lots of them would rather see the whisky runner get away than be taken. In some places, it is different. The police in St. Paul have been co-operating very effectively.

"To patrol a border of 1,000 miles, I had a dozen men last summer. No wonder thousands of dollars' worth of whisky was brought in through North Dakota. Whisky running has become an organized and established profession. Whisky is being shipped from the United States to Canada and then smuggled back into the United States. Some man will organize a fake medicine company in Canada, buy whisky in Kentucky and have it sent to Canada under a medicinal permit.

"A year ago, Harry Rabinovitch had a car of whisky shipped from Kentucky to Canada. A plan to have it stolen in St. Paul was made, but this was thwarted, a man killed in the fight, and indictments for conspiracy followed. Three weeks later, we found some of this same whisky in Minot, North Dakota. It had gone to Canada and been smuggled back. We identified it by the serial numbers."

"However, I think that conditions in this territory are better off than many other sections. The best bonded whisky is now worth $150 a case here. In New York, the market is as low as $65. That's one way to measure the effectiveness of prohibition."

Minnesota two years ago passed a state prohibition law modeled after the national act. It was designed to give county and city officials power to cooperate in the enforcement of prohibition, and in some respects is more stringent than the national law. But three cases, still pending, have been brought under this law in Ramsey County, however.

Officials vary in their opinions of the effectiveness of the prohibition machinery.

"It's a farce as now enforced," said one government agent. "Think of it—at one place last term, we had 50 cases, and got four convictions. The people don't want it, and apparently they won't have it. That's all there is to it.

"Then this requiring a search warrant places an almost insurmountable burden on the enforcement forces. The agents have been places where they could see stills in soft drink places, and couldn't get search warrants. The men get discouraged when they can't get results.

"Another thing—women come in here from the country districts, wringing their hands and telling how bad conditions are. But what can we do, with the few men we have, and the sentiment against the law?"

Other agents engaged in the enforcement work were inclined to believe that conditions were improving. They pointed out that enforcement of the act is a process of education, and gradually sentiment is being engendered that will make it more and more effective.

Typhus in Wake of Alien Flood

By DR. ROYAL S. COPELAND,
Commissioner of Health, New York City.

HAVING come from Europe so recently and having observed at first hand the suffering of the people there, I cannot bring myself to the conviction that an absolute embargo should be placed on immigration. To the suffering people in Europe America seems like heaven. Many a peasant had been known to walk 1,000 miles to reach a seaport where he could gain passage to the United States. Many formerly well-to-do persons, now so near to bankruptcy, their business establishments having been destroyed, their homes wiped out and facing nothing but disaster, are anxious to come here for a new start. Except as a last resort I should not desire to deny them the right of asylum. However, as long as immigration conditions at the eastern ports continue so inefficient as at present, it must be admitted that every immigrant coming from an affected port is a menace to our people.

One of two things must be done. Either an embargo must be placed on immigration from certain parts of Europe, which the President could do under section seven of the quarantine laws, or there must be an immediate improvement in the quarantine conditions. It is not enough for the quarantine officials to inspect the passengers of a steamship merely with a view to determining whether at that particular moment there is any infectious disease aboard the ship. A truly effective quarantine examination would go further than this. It would determine whether or not there are possible carriers of infectious disease aboard. This would mean, so far as typhus is concerned, that every vermin-infested person would be regarded with suspicion.

The period of incubation of typhus is from twelve to twenty days. It might well happen, as doubtless it has in scores of cases, that every person at the time of examination was free from visible evidence of disease; yet these same persons might have been inoculated with the poison typhus fever, which would later show itself in the usual symptoms.

Yet health authorities could well disregard every such person who is absolutely free from vermin. Even though he developed a virulent attack, so serious as actually to be fatal, it would be of no consequence to the rest of society. The typhus patient is not a menace if he is free from vermin.

The conclusion of the whole affair is perfectly apparent. If every person entering American ports from suspected areas is disrobed, de-loused if necessary and equipped with clean clothing, the danger of typhus disappears at once.

New York City has a great housing problem. We have a hundred thousand more families than we have houses. With this great overcrowding, with twelve persons living in three rooms, the menace of typhus is terrible to contemplate. Let typhus once gain a foothold in this city and the whole country will suffer untold misery. The Federal Government should unify the efforts of its Immigration Department and Public Health Service to the end that every quarantine port should thoroughly examine every immigrant.

No vermin-infested person should be permitted to enter the country. All steamship companies should limit the number of passengers carried on each trip and should be required to present cargo and passengers in clean condition. Washington authorities seem slow to act. Congress, the Secretary of Labor, the Secretary of the Treasury and the Public Health Service should promptly supply the equipment and personnel to protect the nation. In every port the municipal health authorities should be permitted to co-operate with the Federal authorities to make certain that local health is protected.

Why Do We Say?

Buy a Pig in a Poke

PIGS are not sold in this style now, but a long time ago in "Merrie England" suckling animals were tied in bags of cloth and thus brought to market. Occasionally a farmer would succumb to the desire to profiteer, not by raising his price but by putting through a clever bit of deception. As most of the buyers were butchers that purchased pigs from half a dozen or more farmers, the dishonest man was not always discovered. However, you can imagine the feeling of a buyer when he opened a bag and found therein a large cat.

Let the Cat Out of the Bag

NOW it is a well-known fact that cats are not as docile as pigs. When Porky finds himself tied up, he heaves a sigh or two but makes the best of the situation. Tabby has a different disposition; when she ascertains that she has been deprived of her freedom, she rues the day of her downfall. She does not resign herself to her fate, but firmly resolves to leave undone nothing that may restore her liberty.

Sometimes Tabby would scratch her way out at the moment when the purchaser paid the price or while he was still dickering for the supposed pig. Sometimes a thoughtless helper would undo a poke; Tabby, of course, would jump out in a streak like the proverbial greased lightning.

In modern usage, the cat is a secret and the bag is a person's mouth. Thus the cat readily slips out when careless words are spoken.

(C) Harris & Ewing

George Washington built a home and not a mere place to live in or work around. Therefore, it is still the most admired farm place in America. Above is a rear view of the Mount Vernon homestead, showing how the "detaching" or de-occupationalizing" process may be applied without lowering of utility values.

Uncle Sam and the Farm Home

By AARON HARDY ULM

This is the second of a series of articles by Mr. Ulm on farm life and farm management.

BETTER farm homes, more efficient and more artistically laid out farmsteads, the adaptation of "city conveniences" to life in the country, are items of farm improvement that are now engaging much of the best thought devoted to agricultural welfare.

This recrudescence of interest in the farm home isn't due to acceptance of the widely prevalent notion that the average American farm home is necessarily inferior to the average American town or city home.

"Country homes are improving in comfort, attractiveness and helpfulness," said the famous Roosevelt Country Life Commission more than ten years ago. Since that report was made improvement has gone ahead at much more rapid pace than ever before.

But during the last half century the farm home hasn't received as much expert attention nor has it so benefited from modern progress as other parts of the farm, like the barn and the field.

"Today, in many of the best farming sections, the barn that houses the cattle, rather than the building that houses the farmer and his family, is the keynote of the farm," said a farm home specialist to the writer recently. "That is, the prosperity and progressiveness of the farm are judged most by the equipment provided for taking care of the cows and horses."

The specialist in question does not take a pessimistic view of the farm home or the conditions surrounding it. He believes that when all values are given proper rating the average farm home is superior to the average city home, especially if you estimate correctly those advantages that cannot be procured by the city home-maker but which necessarily adhere to the country home.

In fact, that is the view of most or all the farm-home specialists in the United States Department of Agriculture, which is now including farm-home subjects in its wide range of research activities.

But the specialists admit that they know very little about it and assert that no one knows much. Only a very few, and limited, surveys of farm home conditions have been made, and there is virtually no scientifically accurate data with which to make past comparisons. While city housing has a voluminous literature, that of country housing is about as vague as the facts and conditions are various.

What they do know about, but by no means all about, are the possibilities available to the farm home.

"The real efficiency in farm life and in the country is not to be measured by historical standards but in terms of its possibilities," the Country Life Commission declared with much truth.

And it is on possibilities that the specialists in the main are working.

The country knows little of the kind of congestion to be found in most cities, though investigators have often found places where something analagous did prevail. But, on the whole, country houses are well provided with space. A recent survey showed that they averaged more than seven rooms each in the farming states of the North and West.

While they are usually large enough, the average farm homes are crudely designed and in many respects poorly equipped. With exceptions that will occur to anyone, the average American farmstead makes little appeal to the sense of form and beauty.

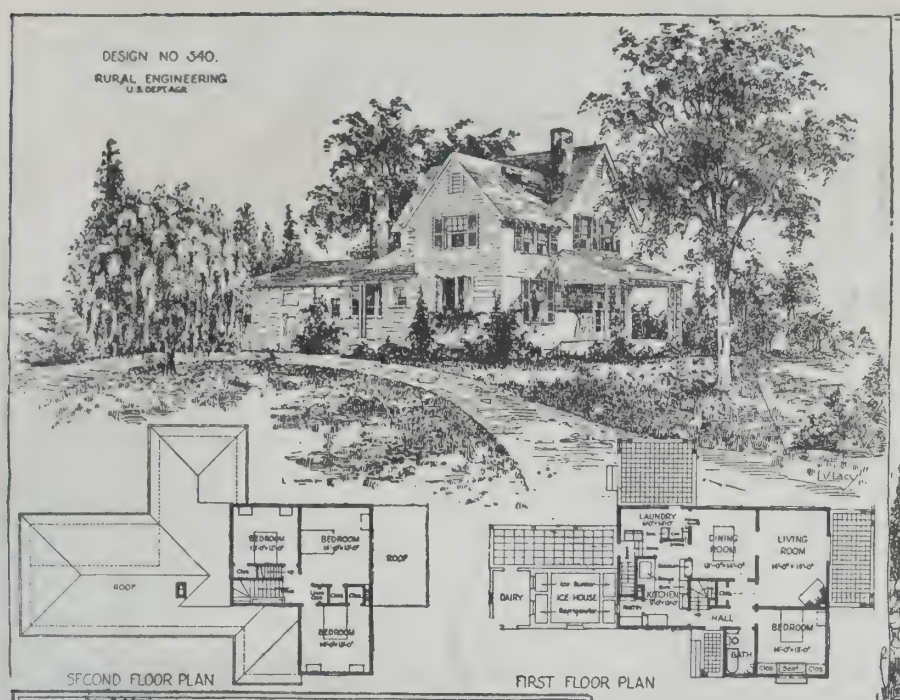
Students of agriculture have come to realize that the farm home must compete with the city home, just as farm work must compete with city work. If the right balance is maintained between rural and urban population, life on the farm must be made satisfactory to the home-maker, the farm woman.

The work of the United States Department of Agriculture on behalf of the farm home follows several different lines. The chief one lies within agricultural extension activities, or the home economics branch of agricultural extension. This has to do mostly with aid carried directly, via home economic workers, to farm women, and aims chiefly at helping them in making the best of the facilities already existing.

During the last few years the department has undertaken researches having to do immediately with farm home facilities. These as compared with other and better known researches, for example, those having to do with plants and animals, have been meager, but are extensive enough to show what can be done for the farm home. They prove that the well-laid-out farmstead, the convenient, comfortable and attractive farm home, and the household refinements quite often regarded as peculiar to ordinary homes in cities only, are not available solely to the well-to-do or "gentleman" farmer.

This is particularly true of the farmhouse itself. One of the comparatively new departmental projects deals with house designing for farmers. Any farmer can procure from the department complete plans for any one of several types of houses; not large and magnificent houses, but in the main small and comparatively inexpensive dwellings.

The departmental architects don't propose for modern day farm construction anything like the old-style colonial residences that still are admired by those who view them—chiefly from the outside. When the writer was shown the plans of a house designed primarily for the South, he was astonished to note that the space given to porches was very small.



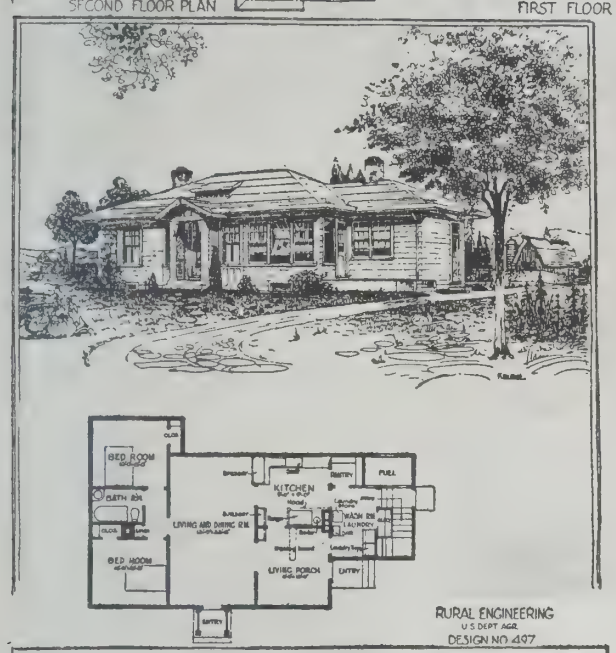
"The big porch all around the house looks well and in summer is very comfortable," said he, "but it is rarely worth the space and the cost. This is particularly true when viewed with reference to the disadvantages going with it. For such an arrangement makes the living rooms dark and somber, the exclusion of sunlight may render them unhygienic, and it is more important to have comfortable living rooms than vast porches that serve mostly for decorative use only. Furthermore, being fully exposed, the housewife desires to keep the porches tidy at all times which involves much extra sweeping and other caretaking."

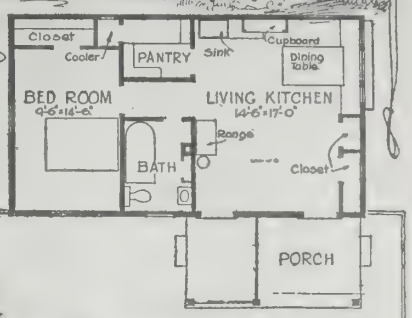
Another violation of southern tradition involved in departmental plans for southern farm residences is the inclosure of foundations.

"Nothing spoils the looks of a house so much as for the structure to sit over an open space as if on stilts," said one of the architects. "Full ventilation under the house can be procured without it."

One of the most interesting sets of plans developed in the agricultural department is predicated on the ambitious farmer's desire to expand his home as his family develops and his means grow.

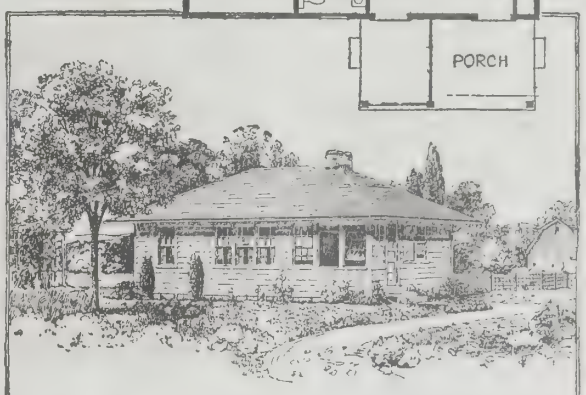
Many beginner farmers want to erect a small house to which they can add as necessity arises. This desire has resulted in much of the ugly and inconvenient house construction found in most country districts. The basic construction isn't designed with a clear view of how future additions are to be made. For help over that difficulty the department offers to farmers a three-installment design for a residence, that may grow along natural and harmonious lines from a four-room cottage to five or six rooms and then to seven or eight rooms. At any of the stages the house looks like a real dwelling. Its growth is not along lines of living space alone. The first proposed additions are a new



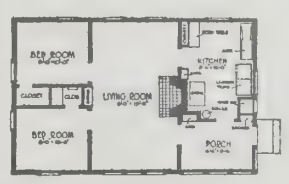


The above is the completed three-installment farm dwelling proposed for farmers by the Department of Agriculture. The first plan is for a two-story, four-room structure, one of the rooms being used as a kitchen. The first addition comprises a permanent kitchen and laundry, the third completes it as shown.

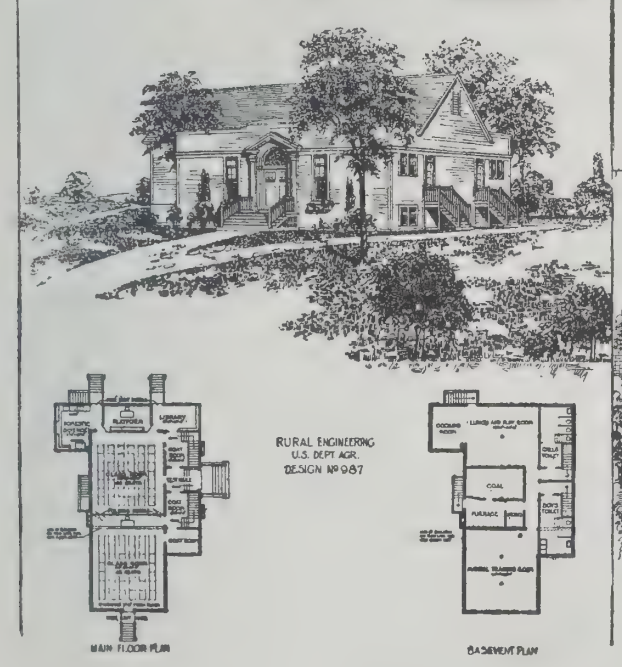
This farm dwelling suggestion—designated by some outsiders but not by its originators as the "love nest"—well exemplifies the Government's rural engineers' efforts to combine high utility with beauty, simplicity and economy.



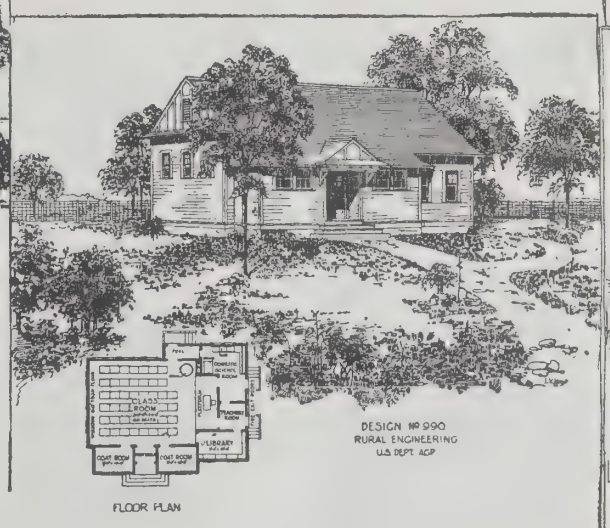
The Department of Agriculture thinks that the problem of housing farm workers bears intimately on the problem of farm labor. Designs 1009 and 1071 are designs that relate to the housing of workers. Each is equal to the demands and means of many farmers who begin operations on a small scale.

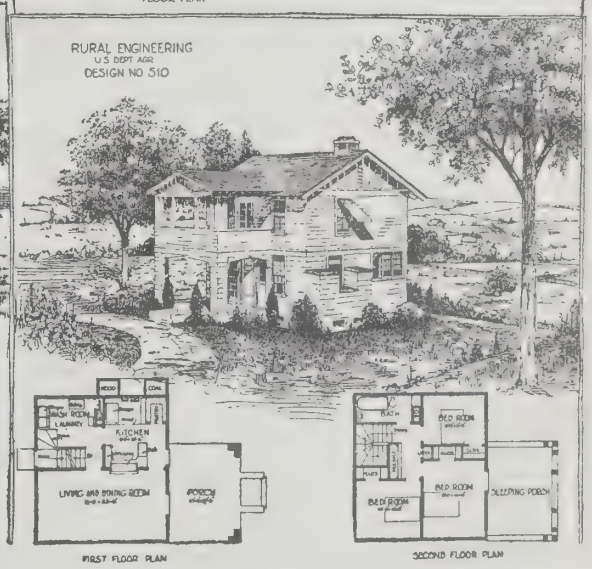


Let Uncle Sam Plan Your Dwellings



Any one wishing to obtain house plans or advice on rural house designing should communicate with the Rural Engineers Division, Bureau of Public Roads, United States Department of Agriculture, Washington, D. C. If any of the plans for designs here pictured are desired, the design number should be given in the request. The agricultural department housing work is comparatively new. No bulletin or catalog dealing with house designing is issued, but many designs and plans for dwellings and also improvements in or on old houses and for outside farm structures like dairy houses and barns are ready for free distribution.





Investigators say that the "little red school" of many rural communities is superior to the average dwelling; but yet is far from being an ideal structure for the purpose intended. Rural engineers of the United States Department of Agriculture have given some study to the designing of country schoolhouses and have worked out several different plans.

The house design at the right was evolved with Southern climate and conditions chiefly in mind. Note the pleasing sleeping porch and the absence of the extensive front porch idea we associate with fine farm dwellings of the South. Extended porches, say Uncle Sam's rural engineers, may prove more of a bother than a luxury, and besides they often render rooms dark and damp.

kitchen and a laundry, and with the third installment a bathroom is provided.

In fact, the departmental specialists' studies have led them to concentrate perhaps most on the kitchen, the laundry and the bathroom—the last two being included in practically all of their designs. They insist that those two household appurtenances can be included in virtually any style and size of rural dwelling.

They have given much thought to the kitchen and laundry for the reason that those two parts of the household bear most poignantly on the housekeeper's efficiency.

"Why place the laundry invariably on the first floor of the house?" they were asked.

"For the reason that no laundry should be in the cellar of any house, except maybe the few that have cellars wholly or mostly above ground. Laundry work requires good light. The place where it is done should be dry and warm in winter and cool in summer which is not the case usually when the laundry is in the cellar."

Another relative ingenuity found in the house plans worked out in the agricultural department relates to the location of the bathroom. Generally it and the washroom adjunct of the laundry are accessible directly from a rear porch or doorway.

"The farmer or his hired man comes in from the fields and wants first to wash up," they say. "No good housekeeper wants him to track up her living room or even her kitchen in getting to the wash room or bathroom. So we fix the bathroom or, better still, the washroom-laundry, at a location that may seem odd to city folks but which makes it the more serviceable in the customary country house."

Another serious inconvenience they have sought to overcome is one having to do with the entrances to most houses.

"During the busy parts of the day, the housewife spends much of her time in or near the kitchen in the rear of the house," they say. "Answering calls made at the front door is bothersome."

Therefore, usually there is an entrance adjoining the kitchen and equally convenient as the front doorway, in the house plans developed by the departmental architects.

In addition to regular farm residences the departmental specialists have also worked out practicable designs of houses for workers. They are usually small, two and three rooms, but designed with a view to comfort, convenience and harmony with the general homestead. They include also bunk houses for farms that during harvest periods have to get the help of extra squads of male workers who have to be cared for on the farmstead. The small workers' houses often would prove sufficient for the beginner farmer and his wife without means for erecting a large dwelling.

"In that case they should be set up with the view of becoming workers' houses after the farmer is able to put up a better dwelling for himself," say the architects. "It should be located so that it will fit properly into the homestead when fully developed."

They have also designed rural schoolhouses, and plans for those may be procured without cost.

"What do your investigations reveal concerning the cost of house construction in country districts?" one of the specialists was asked.

"We have scarcely any data on that phase of the subject," he replied. "A thousand or more of our plans have been procured and ostensibly used. But we haven't been able to get accurate information about costs, which of course vary in different localities.

"However, it is probable that construction costs are lower in the average country district than in the cities. Frequently the owner can do much of the work when not engaged with his crops and can likewise use his teams in doing the hauling. Sometimes much of the material can be taken from the farm. However, it is no more costly to build a properly designed than to erect a merely hit-and-miss kind of a structure. If the farmer has definite plans before him and knows just what he is going to do and why, he can buy and use materials more economically."

The Department of Agriculture does not provide building plans for farm dwellings out of any desire to regulate building or even to save farmers the cost of plans. Its purpose is to encourage the building of better country homes.

The Pacific, and Future of Britain's Dominions

Economic as Well as Political Clash Shifts From Atlantic to Western Seas, With White and Yellow Races Meeting

By W. P. CROZIER

Manchester, England, February—(By Mail).

THE war has made two changes of great moment both to the British Empire and to the United States. It has, as Lord Fisher declared not long before his death, shifted the world's strategic center to the Pacific Ocean. This center used to be in the Mediterranean and the Atlantic, with France and England contending in suspicious rivalry. France dropped behind and the storm-center shifted to the North Sea, with Germany as the new protagonist. Germany disappeared, and for a long time to come the position in the North Sea and the Mediterranean will be stable; no silent struggle of contending forces is likely to be fought out there in any time that the present generation can foresee. Now the Pacific takes the place of the western oceans, and the United States is the greatest power in the Pacific.

It is not that one sees the Pacific as the scene of wars, "inevitable" or other, though there are military and naval gentlemen who (as befits the exercise of their profession) see it in no other light. But the conditions there are uncertain. There are sharp problems which it ought to be possible to solve peacefully, but which have yet to be solved. There are the aspirations of the yellow races, their claim to full racial equality, the fear of the white peoples lest their economic standards should be undermined by yellow immigration, the political ambitions of Japan, and the weakness of China, which has always menaced the peace of the Pacific. It is idle to delude ourselves. The growth of the Japanese and American navies is one proof that the Pacific—if one may say it of an ocean—"holds the stage."

The recent reports that Canada has made an informal agreement with the United States about naval policy in the Pacific are highly suggestive. We are told that Canada has come to an understanding with the American Government, that Canadian warships will use American harbors on the Pacific and that it has even been debated whether in time of war in the Pacific, Canadian and American warships should be under one command. The last proposal, it is said, has been postponed, as well it might be, if it was ever made, since it is difficult to see how Canada, while still a member of the British Empire, could covenant to place her ships in time of war under a common command with any other power. The suggestion would not be credible at all but that during recent years the British Dominions have been asserting increasingly their right to dispose of their own destinies in the foreign as in the home field. And that is the second great change due to the war. Let us set these changes out, because they contain in them the germs of great happenings in the future:

I.

The clash of nations (not necessarily warlike, but economic and political with warlike possibilities), is shifted from the Atlantic to the Pacific. There is an antagonism between the white race and the yellow, which would be less dangerous but for the spearpoint furnished by the pride and enterprise of Japan. The white race is drawing together.

The naval programs of the United States and Japan crystallize the situation.

II.

The British Dominions were already before the war asserting their virtual independence in many most important respects. The war and the sacrifices which they made in it have given this movement an enormous impetus.

They desire still to remain within the empire but they increasingly resist the idea that they can be bound by the policy of the home government in London. Their desire—and determination—is for complete freedom over their own actions at home and abroad, for nationhood on an absolute equality with the mother country.

Let me give some of the evidence of this great change which is taking place now in the British Empire. The Dominions (and India) each signed the Peace Treaty of Versailles separately. Each of them has independent representation in the assembly of the League of Nations. I am aware that this provision has occasioned criticism in the United States, but perhaps it has not been sufficiently considered that the Dominions demanded this individual representation and, if Canada is so much a nation that she desires a separate minister to the United States, how is it possible to deny her a seat in the League?

About Canada's views there is no question at all. The House of Commons in London passed the Treaty of Versailles almost without comment or discussion, the government saying bluntly that it did not propose to have the decisions taken by it at Paris modified or reversed. When the treaty was sent to Ottawa for the consideration of the Canadian Parliament, Lord Milner (our secretary for the Colonies) sent telegrams which urged that sanction should be given to it at once and implied that discussion by the Parliament at Ottawa was a mere formality signifying nothing. Sir Robert Borden replied very vigorously at once, asserting the right of the Canadian Parliament to a genuine and independent discussion of the treaty.

Since then Canada has put forward the proposal that she should have a separate diplomatic representative of her own at Washington, in addition to the British minister. The suggestion has not yet been carried into effect, it is said, because the British Foreign Office is opposed to it. But, once made, it is very unlikely to be dropped. And, let there be no mistake, it is revolutionary. It marks the formal beginning of the epoch in which the British Dominions will manage each its own foreign affairs, have its own diplomatic ministers and make its own treaties.

Here arises a constitutional puzzle of the first order. Suppose that we have within the empire the home country, Canada, South Africa, Australia and New Zealand all co-equal, each directing its own foreign policy, and each advising his Majesty the King to take such and such action. Suppose, again, that when some question of common interest arises, the advice given by certain of these five empire-nations is in conflict, as it very well might be. "Oh," the reply is sometimes made, "then there must be some common organ of government, some imperial parliament or cabinet, which will harmonize such differences and evolve one common policy for all." But it is precisely this close federation, with its restrictions on the liberty of the individual people, that the Dominions simply will not have. Their tendency is all the other way—toward a greater freedom and independence. How, then, to solve the puzzle? No one here can say. We leave the question to ripen slowly and hope that time and common sense will solve it, as it has solved many difficulties before in the growth of the British Empire. The trouble is not on us yet; we merely descry it in a not distant future.

A similar tendency to insist on the right of self-expression may be discovered in the Union of South Africa. Superficially, General Smuts's action in splitting off definitely from the Nationalists and creating a Moderate party by the fusion of his own South African group and the British Unionists might be thought to make for a closer imperialism. But in fact, while it implies a blow to the Republicans who would take South Africa out of the empire altogether, it does not in the least abridge the self-governing rights of South Africa. General Smuts, in fact, tried hard to establish the bases of an agreement with the Republican Nationalists, and in the attempt assented to the assertion of the principle that it lay with the people of South Africa to declare their own future—that is, to decide for themselves whether or not they would remain members of the British Empire. In every direction the British Dominions are more and more asserting their independence in action while preserving the bond of the Crown as the link which unites them with the mother country and with one another. Take, for instance, the governor-generalship of Canada. The governor-general represents the king. The present practice is for the home government to present a name or names to the Canadian Government and ask for its choice or approval. But in Canada they are saying that this is insufficient and that before long they will simply choose the viceroy themselves and inform the home government of the choice which they have made.

In India we have just established a measure of responsible government. India has set her foot on the same road as the Dominions, but is only at the beginning of a long journey. Curiously enough, it is India that has lately provided an opportunity to the school of thinkers which believes that the future of the empire lies in a close combination of all its parts and the surrender by each of them of some of its liberty. A committee, presided over by Lord Esher, has been deliberating on the future of the Indian Army. This committee states frankly that it has in view the day when the whole empire will be ruled by an imperial cabinet, which will include Dominion and Indian representatives and be responsible not to the home parliament at Westminster but to an imperial parliament, and will give directions to an imperial general staff which will dispose of all the imperial forces, including the Indian Army.

But let no one in America suppose that this fantastic scheme is likely to be realized. It is in the last degree unlikely that there will ever be an "Imperial cabinet" which would be responsible to, and would have power to bind, the various British parliaments. It is quite likely that the British cabinet in London will in the future, as in the past, call in Dominion statesmen for consultation. But that is a wholly different matter. Such statesmen have no power whatever to bind their parliaments and countries and the British cabinet which consulted them would remain responsible to the British Parliament as before and to that only.

The tendency of the Dominions is wholly different. It is to assert their freedom of action; to decline absolutely to tie themselves down in any scheme for imperial federation, imperial cabinets or imperial parliaments; and to diminish progressively the authority which the mother country still exerts over them in the field of foreign and military policy. The Dominions will remain within the empire out of affection and out of affection they will, if the need arises—so we hope—maintain it.

But there is no limit to the practical freedom on which they will insist. It will extend to the control of their military and naval forces and to the direction of their foreign relations—Canada shows the way—and we shall have to square this larger independence with the formulae of the imperial connection. With good will and mutual tolerance we shall succeed. But it is a stage of development worth studying not only by us but by Canada's neighbors in the United States.

She Made Bolshevik Busts

Mrs. Clare Sheridan is regarded as one of the most beautiful women in English society. She is highly talented and is a sculptor of note. A great traveler, she recently returned from Soviet Russia where, at much personal risk, she made busts of Lenin and Trotsky, the prime minister and minister of war respectively. Mrs. Sheridan, always handsomely gowned, speaks of her dangerous exploits with a calmness and poise which are nothing short of amazing in view of her youth and beauty. She is a cousin of Winston Churchill.

Many Men of Many Minds

Sir Hall Caine.—Some of us honestly believe that if Great Britain is to do so no longer, it will be good for the peace of the world that the great democracy of the West should rule the great highways of the world.

Sir Thomas Lipton.—Saving is the first great principle of all success. It creates independence, it gives a young man standing, it fills him with vigor, it stimulates him with the proper energy; in fact, it brings to him the best part of any success—happiness and contentment.

J. J. Underwood.—The day when representatives could be frightened with awful tales about what this class or that class was going to do to them at the next election has gone by. There is a general feeling that it is about time something was done for the country as a whole, and that's what's going to be done if Congress has its way about it.

H. A. Henderson.—With Bolshevism knocking at her eastern gates and with all the Entente Powers more or less hostile to the man who has returned to the throne, Greece may yet have cause to regret the absence of the great leader she has repudiated.

Professor George Santayana.—To be poor in order to be simple, to produce less in order that the product may be more choice and beautiful, and may leave us less burdened with unnecessary duties and useless possessions—that is an ideal not yet articulate in the American mind; yet here and there I seem to have heard a sigh after it, a groan at the perpetual incubus of business and shrill society.

John D. Rockefeller.—How can one be ready for the glorious opportunities ahead of him unless he has cultivated the habit of economy and prudence? He must save all he can in season and out of season.

Stuart Chase.—If society made the things it genuinely needed according to the best available technical methods of production and distribution, there would result an industrially wasteless society.

Philip Gibbs.—The soul of France is not happy nor at peace. Her agonies are too fresh, her wounds are still unhealed, and the price of victory has been too great. Whether one goes to the chateau of the landowner or to the cottage of the peasant, or the poor rooms of city needlewomen and workers, one is confronted instantly, four times out of five, with the ghost of some dead boy or man who haunts the living.

C. W. Nash.—Real success is the realization of an ambition to build or to accomplish something worth while and lasting. It is the achievement itself which brings the greater reward of satisfaction, not the money it may amass.

T. M. Fraser.—Only the strictest enforcement of the immigration laws is preventing Canada from being flooded with Europeans fleeing from the poverty and desolation of that continent. Both in Europe and at our ports the immigration authorities are on the alert to prevent the entrance of undesirables into Canada. It is anticipated that there will be an even stronger flow of European emigration to Canada's shores. It is a most difficult task to control and also to prevent undesirables entering, but if the regulations are not strictly enforced this country will soon cease to be Anglo-Saxon.

Canada Won't Be Anglo-Saxon If Aliens Flood in

Mary Garden.—I hope soon that we can put on Wagner and other German composers. Then I plan 33 per cent each Italian, German and French; and when good opera comes to be written by English and American composers, I would have their work performed in English for English as a singing language is as understandable as any other, as demonstrated by John McCormack, the greatest exponent of English singing I have ever heard.

Henry Cantwell Wallace.—We must have it constantly in mind that the fertility of our soil is our greatest national material asset, upon the maintenance of which our very existence depends. We can take little pride in great production if it means the depletion of our capital resource.

Andrew J. Volstead.—The saloon has been thrust from existence throughout the United States.

E. M. Statler.—When we do not improve, learn, develop old ideas or find new ones—we go backward. And you and I know how fast we go, when there's no driving power to keep us going forward.

Marshall Field.—I would consider it criminal if I did not take advantage of my opportunities to assist in the developing of American industry. It is using money, becoming part of the great exchange of ideas, investments, purchases and sales, that makes a man feel that he belongs to the life of his country.

Frank L. Dykema.—We are in a period of low citizenship morale, not as an after-the-war reception but as a logical result of the failure of our schools, churches and homes to train the citizens of today, in their youth, that the rights of an American citizen can only be preserved through the recognition and performance of the duties of an American citizen.

R. P. Hearne.—Within ten years the power monopoly of coal will be broken, and it will be broken not by political or economic methods, but by the arrival of a new fuel which will displace coal. Long before our coal measures are exhausted, coal-mining, as we know it today, will have ceased, and the coal strike will become as obsolete as coal itself. The age of liquid fuel has already commenced.

John Hays Hammond.—The sentiment is every day growing against the politician-orator type. The people want men who will talk less and do more; they are happily beginning to learn that the impassioned oratory by which a man gets himself elected to office grows out of a disposition that usually unfits him for the position to which he is elected.

Judge K. M. Landis.—Saloons made crooks and crooks made horseracing and boxing more than the public would stand, but neither liquor nor crooks are going to spoil baseball.

Unknown America—Looking Over Lookout

Concluded from page 6

cactus, and green-blazing small trees. But these bedizenments are less noticeable, and less frequent, than are the freckles on the face of a red-haired urchin.

In clearings scattered through the forests there are other rock plains. But they are fairly level places, and none of them is of any very great area. From one side to the other they are covered with shallow indentations that have the appearance of footprints of broad-footed beasts. Looking upon these smaller rock fields it is no strain on your imagination to picture them as animal dance halls when the rock scum still was soft. The indentations seemingly are the records of the solemn advance and retreat, and advance again, of these animals through the steps of some ridiculous rigadoon. The impression of looking upon an abandoned dance hall comes to a windup when you count the number of elevations scattered about its edges. These elevations are shaped like precisely-cut-across tree stumps that might have served as supports for benches giving comfort to onlookers during the festivities.

The endless lure on Lookout Mountain, however, is its streams, if you're at all active, and delight in paddling your own canoe, or in rowing a wide-nose, flat-bottom boat. The rivers flow through stretches of forest, and suddenly turn to make their way through gorges whose walls are smothered beneath restful laurels and gay rhododendrons, eerie orchids and flowering shrubs that wave in fantastic legless ballet as you pass them. Strings of a hundred and more fighting game fish are not uncommon in one day's catch. In the pools you can anchor your boat in the shade of the pines, and lie on your back in utter abandonment to the spell that comes over you—for Lookout Mountain is hypnotic.

The flora of Lookout is a hybrid of tropic growth and temperate plant life in many instances. And there are the fungi that are numerous and forward in their uncommon and brilliant colorings. Designers of women's dress fabrics are beginning to search the mountain's top to find and to examine these fungi for the purpose of evolving from them new color combinations. One of the fungi is shaped like a flapjack, supported by a short, stocky pedestal. The middle of the growth is overfat, but it thins to sharpness near the edge. On the top surface, and near its edge, the coloring is delicate orange. The tint deepens gradually toward the center, where it is a soft-toned spot of deepest hue.

Of course, all things on Lookout Mountain are not the handiwork of nature. A good many of them are man-made, and when you wander among some of them you immediately face a wall of haunting, unwritten history. There are, perhaps, more caves and grottoes on Lookout Mountain than there are on any other elevation in the world. In a few of these grottoes prehistoric men have left records that are unreadable. Coming down to the days when exploration was the principal business in the United States, De Soto crossed the mountain from Georgia into Alabama, and stopped at a place where Little River drops over a rock formation of peculiar texture, and then into a deep basin. From there the stream flows through a drawn-in gorge that follows a tortuous path to its meeting place with the other two rivers. During high water the falls extend to impressive width, and during low water it is a brook that affords unique shower bathing.

A ledge projects into the basin above the ordinary height of the water. It forms a platform before several openings that are entrances to caverns beneath the falls. Prehistoric mountaineers fortified these caverns, and some distance back in them the ancient defensive works are still in existence. What these ancients did when the water in the basin was high enough to flood their fort is a matter for conjecture; but floods seem never to have caught them unprepared, for their fort remains in very good condition when you take its evident age into consideration.

To the west of the falls a gigantic rock wave, seemingly at one time on the move from the direction of the falls toward the west, halted, it is easy to believe, and reared its head for a view of the surrounding country. Before it could bring its head back to earth-level it was stricken with solidification. Upon three sides this wave presents an unclimbable front; the fourth side slopes gradually in the direction of the basin. De Soto built a fort on the rock wave. It consisted of two stone walls, the first an expansive half-circle near the bottom, and from edge to edge of the wave. The second wall is a half-circle well up toward the brink. About seven feet of these walls are buried in humus, leaving not more than two feet above the surface. What De Soto did in the neighborhood, and how long he stayed there, is something for you to puzzle over, if you are historically inclined, for nobody seems to have very much to say on the subject. About all the information that you're likely to get is that De Soto, or some one who came after him, gave his name to the falls.

It is in the neighborhood of De Soto Falls that you come upon the heart of one of the most interesting aspects of Lookout Mountain. Particularly since the start of the World War back yonder in 1914, this entire region has been the playground of fine old southern families. They come from the heart of Romance Land in Louisiana; from plantations and cities of the Carolinas, and of Georgia and Alabama; and from every other section of the South where traditions not only are narrations to be handed down from generation to generation, but where they also are something to be actually lived from day to day.

In the wildest and most fascinating sections of this part of Lookout Mountain, extending below what is known as "Grand Canyon," because of its resemblance to the natural wonder in the West, these families have built summer homes. Against this weird background they live the sort of a life that reproduces a good deal of the romance of the South that most of us have read enough about in the pages of quaint fiction and description, but that few of us have ever seen as a bit of old-time realism. These genial pages from rare books begin to appear early in the spring, when the families come onto the mountain, and they flourish until late into the fall, when the migration from it begins.

The homes are known as "slab shacks," because they are constructed from slabs that are cut from the logs made by the timber cut away to provide a place to erect the buildings. In style these structures vary, from bungalows to rambling affairs, on the order of old-fashioned plantation "big houses." In places the "slab shacks" are grouped in colonies near the east and west brows of the mountain, and again families live in complete isolation in out-of-the-way places that are hard to find without a guide. There are also several hotels that really are community homes, built after the same delightful pattern. Clubs have purchased immense tracts of land. On these holdings the "shacks" are built nearer together, so that hot and cold water and electricity can be supplied from central plants. The idea of spending the summer in the South may appear to be a wild thought if you've never rambled that country during warm weather, but though the days are hot, of a night, even in July, camp fires are often pleasing things, and blankets are almost a necessity before morning.

Briefly Told

The wholesale prices of vegetables and fruits are so low in New York markets that many producers who shipped produce there received nothing in return but a bill for the balance due on the freight charges.

Spiders' webs may be preserved if they are sprayed from an atomizer with artists' shellac and then pressed carefully against a glass plate at the same time severing the supporting strands. Many spider webs are beautiful, having interesting characteristics of the species to which they belong.

A Pennsylvania surgeon sixty years of age recently removed his own appendix by the use of a local anesthetic. Next day he was further on the road to recovery than is usual the day after such an operation and dictated a number of letters giving directions regarding the conduct of his personal affairs and practice.

Joss sticks are made of a stem of bamboo rolled in a preparation containing many different odoriferous drugs, two of which are aconite and camphor. The aconite serves to protect the sticks against the attacks of rats and mice and the camphor causes them to burn steadily.

Calcutta is said to be the greatest rat exchange in the world, the rodents finding their way to and from that point in vessels.

The center of population as shown by the 1920 census is located in the southeast corner of Owen County, Indiana. It has advanced 9.8 miles westward in the last decade.

Small mines isolated from the outside world are often forced to close down by reason of breakage of machinery and difficulty in getting in repairs. In the Sierras airplane service has been used to transport parts and is proving successful for that purpose.

The legislature of New York state is considering the use of an electric scoreboard for the registration of votes which would permit a quick and accurate count of votes cast and in addition call the roll. Each assemblyman would have three push buttons marked "present," "no" and "yes." The signal would be registered by a photostat which would make a permanent record of the proceeding.

By blending corrugations or ripples in wire glass it is claimed a glass has been evolved that throws the light all over the building. This glass is strong and durable, being made in one solid piece and not in layers.

Trench-digging machines used during the war are now being employed to construct a pipe line from Havre to Paris.

Chemists have succeeded in extracting an oil from apple parings which possesses in high degree the characteristic and delicious odor of fresh apples. The oil is extracted by means of ether, and it is hoped that it can be turned to useful account for perfumes or flavoring purposes.

Candles are used for lighting purposes in the gold, diamond and other mines of South Africa.

A large section of State street, Wilkes-Barre, Pennsylvania, recently dropped into the mines beneath the city. The hole was four hundred feet square and very deep.

California fruit growers have launched a nation-wide campaign to put the raisin back in legitimate channels of circulation as a food and out of use as a poisoner and a killer. The amateur brewer is responsible for the campaign.

Black rabbit fur, shaved down to the regulation fur length, is made up into imitation seal skin garments, according to a rabbit fancier of Arvada, Colorado.

Gold was discovered running $10 to the ton by a resident of Glendale, California, while he was excavating for a basement in a new residence.

By boring a hole in the earth's surface twelve miles in depth enough energy would be discovered to furnish all the motive power of the world, according to a British scientist.

The government plans to cross the reindeer of Alaska with the wild caribou to build up a higher grade of reindeer, having greater weight and increased hardiness.

Chile's nitrate fields, the principal source of the nation's wealth, are limited to a narrow strip of arid desert located on the eastern slope of the coastal range, west of the cordillera of the Andes.

The great falls of the Orange River in Africa are more than twice as high as Niagara and higher than the Victoria Falls.

Paper made from wood waste in veneer factories is possible, according to findings of the forest products laboratory. The cores of many kinds of veneer logs and a large part of the clippings could be turned into pulp stock for the manufacture of high grades of paper.

A cure for rabies in the form of a vaccine has just been discovered by two doctors of the Pasteur Institute in Paris. The vaccine has been successfully tested on dogs afflicted with the disease and has effected speedy cures in every case.

A resolution recently introduced in the Idaho senate proposes the secession of the northern part of the state and the forming of a new state consisting of the ten northern counties. This territory claims a population of 150,000 people and an area of 35,000 square miles with property valued at $150,000,000.

Using a seaplane as a means of conveyance, an author is exploring Dismal Swamp in Virginia. He hopes to penetrate far into the wilderness and to take many photographs of regions heretofore unexplored.

A timepiece set in a finger ring is the latest innovation. It is so small that a glove can be put on over it easily.

Vast quantities of precious stones in an old iron trunk deposited years ago in the treasury of Austria were recently brought to light by the Finance Minister who was searching the treasury. The treasure for the most part consists of opals and other precious stones.

A wireless plant has been installed by the Navy on the Oregon coast for the purpose of giving vessels their bearings during fogs and in bad storms.

Rust-free steel has been produced by a Norwegian electro-chemical company. It is claimed that the steel does not rust and that most acids do not affect it. It is also claimed that it can be produced at the same price as ordinary steel.

Dog teams will be furnished men employed by the Edison Company in the Sierras of Southern California during the winter months when they are cut off from the outside save by wireless.

Scores of families left their homes in Bilbao, Spain, taking their furniture and live stock with them when a steamer with one hundred tons of dynamite on board stranded off the town. Notwithstanding the high wages offered, laborers were afraid to go aboard the vessel and it was necessary to summon workmen from an explosive factory to bring the dynamite ashore.

Two old-time prospectors recently appeared at the county recorder's office in Denver and staked a gold claim in the heart of the city. They say they struck a rich vein in the ground beneath the City Hall, the Union Station and other portions of the business district.

The tangelo is a new fruit, a cross between the tangerine and the grapefruit, and is more tender than either. The United States Department of Agriculture states there is little or no tendency for the juice of the tangelo to squirt when the spoon is inserted.

The use of the X-ray to diagnose tuberculosis is invaluable in determining just how far the ravages of the disease have advanced. Physicians specialize in this branch which is called "roentgenology."

Uniform landmarks in stone are to be set up as a lasting memorial along the line of the great battlefront from the Swiss frontier to the North Sea. The stone selected is pyramidal in form and perfectly simple. It will be ornamented by a soldier's helmet, surrounded by a laurel crown with the inscription: "Here was stopped the onrush of the barbarians."

The threatened extermination of the elk herd in the Yellowstone Park is alarming the officials in charge. On the ranges where ordinarily thousands of these animals could be seen, only a very few have been observed this winter.

"Cutting Up Old Circus Money"

The first of the most interesting collection of reminiscences ever gathered on the circus of another generation.

Jewish versus American Rights

Demands made by Jews in scores of American communities throw light on Jewish conception of their "rights."

Money-Making

A Ship of Mercy

Two splendid stories, one having to do with our currency factory, the other with the new hospital ship Relief.

Ousting Devil in the Small Town

A story, graphically illustrated, of some of the dangers of the village and how common sense removes them.

Navy Operates First Exclusive Hospital Ship—By H. O. BISHOP

Top—Commander R. C. Holcomb, a medical officer of the Navy, who is in command of the U. S. Hospital Ship, Relief.

Center—United States Hospital Ship, Relief.

Bottom—Operating room on the Relief.

THE American Government has put into commission the first ship in the world built from the keel up solely for military hospital purposes. This innovation of naval architecture has been given the appropriate name of Relief. It will care for the comfort and welfare of the sailors and marines of the United States Navy.

Equipped with every modern device to aid in relieving sick and wounded, and with a bed capacity of 500, the Relief incorporates in design and equipment all the appointments and advantages of a modern hospital. This assures the Navy personnel, however far from home ports it may be, that in case of sickness or injury it can expect the same facilities for diagnosis and treatment that are accorded residents of any of the large American cities in municipal hospitals.

Not only is it prepared to care for the sick and injured, but the Relief is also fitted as a fleet medical supply depot so that she may fill ships' requisitions for emergency medical supplies. She also is provided with a field hospital with tentage, drugs, instruments, ranges, cots, ambulance, and various other supplies, so that in the event of a catastrophe like the Baltimore fire, the Galveston tidal wave, or the San Francisco earthquake, she can render valuable aid by sending carefully trained men ashore and quickly establishing a field hospital.

This is the second hospital ship named Relief in the American Navy. The other served as a hospital ship with the Army during the Spanish-American War and later in the Philippine insurrection and Boxer uprising in China. At the time of the cruise of the battle fleet around the world, she was placed in commission with the Navy and accompanied the fleet as far as the Philippines where she is today. The Navy has three other hospital ships, the Solace, Mercy, and Comfort, all ships of honorable and efficient service during the Great War. These ships, however, were merely converted from merchant ships for hospital purposes.

As long ago as 1910 the general board of the Navy recommended that a hospital ship be included in the building program of the Navy. It was not until 1916 that Congress appropriated the money to build one. The keel was laid in 1917 but because of the war, construction was suspended until 1919. The Relief was recently completed.

The Relief is 483 feet long, about 10,000 tons displacement, twin screw, oil burning, and turbine propelled. In accordance with the provisions of the Geneva Convention and the Hague Conference she is painted white with a wide green stripe from stem to stern. This green stripe denotes a military hospital ship. Were she a Red Cross Hospital Ship, according to the provisions of these conventions, there would be a red band. Painted on the side of her hull and on the side of her stack are large red crosses. There are likewise on her upper works red crosses showing skyward for identification by hydroplane or airplane, that her neutral and humane mission may not be mistaken, and to establish her identity at night the red cross and other markings can be illuminated.

For boarding the Relief from a boat, a much larger platform is provided than is encountered at the gangway of an ordinary ship, this platform being large and roomy to provide for handling stretchers. In the after part of the ship there is a specially designed apparatus for lifting a patient from a boat in a splint stretcher. This apparatus is constructed on the principles of the quadrant lifeboat davits, and they are located well aft where there will be the maximum lee in a seaway. From the gangway one steps immediately into the hospital division of the ship. Here the wards are located. At the gangway entrance on both sides of the ship are located small operating or dressing rooms. Here the injured cases may be received and cleaned up before being sent to the wards.

The hospital wards and utilities are located in the comfortable midship space of the ship where there may be the least amount of pitch. There is a forward and after group with elevator service for each group. The second deck is the connecting passage so that there is access by stretcher between the hospital departments without going out into the open; thus such special rooms as the X-ray room, operating room, hydrotherapeutic, dressing room, and so on, are available from all parts of the ship.

The typical ward consists of standees of berths which may be banked in two tiers or as single berths. The berth is detachable, so that a patient may be handled if necessary without removing him, and is accessible if necessary from both sides. The berth is much wider than the usual ship berth. Its ready adjustability promotes the ease of handling the sick. The patients' heads are in the direction of shear (sear is the slant of a deck in the fore and aft direction) and this very necessary requirement of having all heads forward is taken advantage of in the arrangement of the lighting. Because the overhead decks of a ship, or ceilings, are low, and because the sick lie on their backs looking upward, special care has to be taken to keep the light from shining in the patients' eyes. As all heads are directed forward it is only necessary to place the lights in such position that they will be over the fore and aft aisles and a little forward of the athwart ship aisles and then put a screen on the forward side of each light. This results in a light free from all disturbances. At each berth, there is a portable comfort or utility light, which may be used for reading.

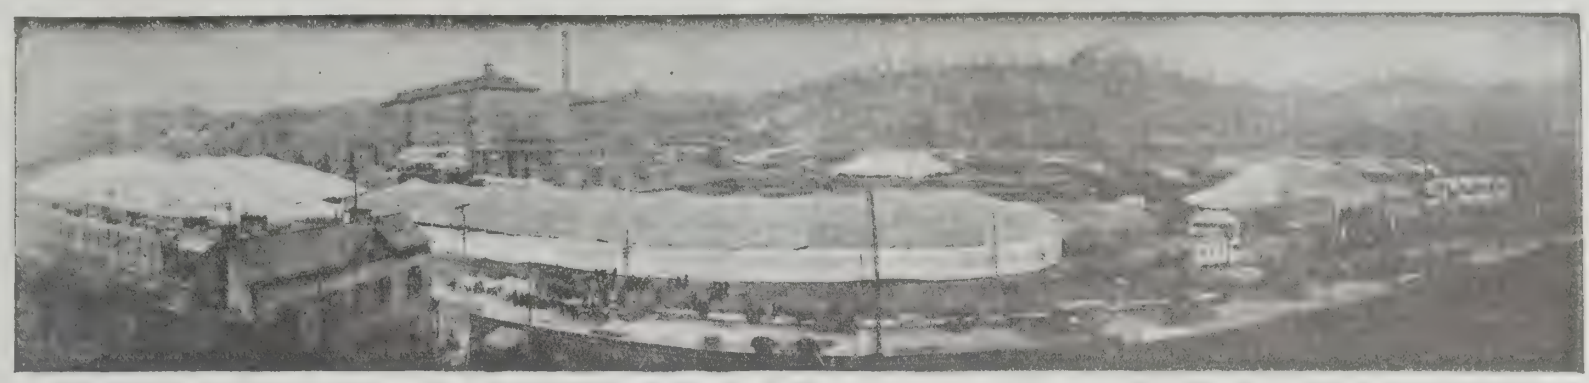
The wards are excellently ventilated. The air supplied the wards is first heated by thermo tanks and then forced into ward spaces. Adjacent to each ward are such rooms as toilets, baths and wash rooms, linen rooms, pantries and quiet rooms. The decks of the ship are wide and spacious and are provided with fittings to care for 100 or more swinging cots.

On the main deck near the gangway is the outpatient department. This is a group of rooms which while convenient and accessible to all wards by elevator, is likewise located so that patients sent from other ships for special examination, or co-operative diagnosis or treatment, and who will not remain on board as patients, may be cared for without invading the hospital precincts. Each of the larger ships, like battleships, has its own medical department with splendid equipment, but the medical officer often desires the assistance of consulting specialists, and in this out-patient group, are the X-ray and X-ray study rooms, the eye, ear, throat and nose rooms, the laboratory and dental department. All rooms are available for co-operative diagnosis not only to the wards of the hospital ship but also to the wards or sick boys of the ships of the fleet.

The after part of the ship is designed to care for contagious diseases. As the ship rides to wind or breeze this division would be to the leeward. There are four small wards for these cases, each with its own toilet and provided with adequate means for disinfection and prevention of spread of contagion.

There are many special rooms on the boat. A splendidly planned operating room two decks in height with excellent natural and artificial lighting and ventilation and with such accessory rooms as etherizing room, scrub-up room, sterilizing room, and dressing room and lobby. These rooms are on the upper deck adjacent to the sick officers' quarters. Most of the acute service wards are located on the second deck consisting of such special departments as the endoscopic room, two small operating rooms, and acute treatment room, and the hydrotherapeutic and thermo-therapeutic departments. On the main deck well aft are such rooms as the embalming, sterilizing, and incineration rooms. For preparation of food there are a main galley and a special diet kitchen. In the main galley food for the well is prepared. The special diet kitchen is fitted with electric ranges, and various other appliances for preparing the special diet for the sick. From this room the food is routed to the various ward pantries and to the bedside by means of portable cafeteria. By this method hot food for those in bed is assured.

One interesting feature on board the Relief is a mechanical cow which provides milk for the sick. For years everybody has been familiar with partially dried or evaporated milk known as condensed milk or evaporated cream which is heavily sweetened by the addition of cane sugar. The milk made with the mechanical cow is a reconstructed milk and the process is simply one of taking ordinary milk apart and putting it together again, these parts when separated having very good keeping qualities.



When it is desired to reconstruct the milk, unsalted butter and milk powder are brought together in a definite proportion of water, mixed and then put through an emulsifying process, producing a palatable milk of any degree of cream richness desired. As something over four-fifths of milk consists of water, some idea may be obtained of the bulk eliminated by handling the product in this way. As an evidence of the practicability of this process, when the city of Nitro, West Virginia, grew up over night, with a population of 25,000 inhabitants, no milk supply was in sight. But by means of the mechanical cow, reconstructed milk was produced.

It is entirely possible also to go a step further and by using a flavoring extract to obtain a product that only needs to be frozen to make ice cream. As the freezer is stationed alongside the mechanical cow, the ice cream mixture can be poured from the one into the other and the finished product is ready for dessert.

A spacious laundry equipped with all modern machinery is connected by elevator with the several decks, linen stacks, sorting and linen repair room, in which are located an electric marking machine and electric sewing machines.

The operation of the ship requires a crew of 400 officers and men. They are divided into a deck, engineering, supply and medical department, each a coordinating and co-operating division. In addition to the men of the hospital corps comprising the medical department for the care of the sick there is detailed a group of trained women, members of the Navy Nurse Corps.

The ship is commanded by Commander R. C. Holcomb, a medical officer of the Navy.

WHEN THE CIRCUS COMES TO TOWN.

"Cutting Up Old Circus Money"

I. Pioneer "Rolling Shows"

By HARRY BARNET

THE circus of today is not the circus written of in these lines. But this and succeeding stories which will appear from time to time in THE DEARBORN INDEPENDENT are perhaps as interesting a collection of reminiscences of circus life as ever has been gathered, and the incidents here related are a veracious account of the struggles of pioneering under the Big Top.

"WHILE I wasn't exactly born under circus canvas, I didn't miss it very far," said "Governor" John F. Robinson one evening late in the summer, when we sat beneath age-old trees that make shade-shadowland of the immense lawn about the family home at the Terrace Park winter quarters of his former circus near Cincinnati.

"Three hours after mother rode her horse in the ring of pa's circus," he continued, "I was born in a tavern room overlooking the canvas. That happened in Linden, Marengo County, Alabama, on the 4th day of November, 1843. Eighteen months later I made my debut as a circus performer.

"Of course, I don't remember that debut," the "Governor" went on, "but pa used to tell me about it, and he laughed every time he told me.

"He was one of the very few four-horse equestrians in the world, and he had half a dozen acts. One of them was 'The Courier from St. Petersburg.' When pa came into the ring, there was a lot of funny business between the ringmaster, the clown and the courier. Pa was the courier, and when this funny business was over he was given a mail sack to carry to its destination. It was a big valentine envelope kind of an affair, and I was dressed as Cupid, and hidden among a lot of old papers on the inside of it. I was frightened to death every time they put me into that sack, and shut the end of it.

"Well, pa started off, riding one, two, three, and finally four horses at the same time. When he was riding the four of them, he pulled me out of the envelope, and every time he changed his position he shifted me into a different pose to represent famous statuary.

"Pa said that on the night of my first appearance I was cold—it was a bad night, and I had nothing on but a pair of tights that mother had made me from some kind of thin material—and the papers in the bag made such a warm nest that I went to sleep in spite of the fact that I was badly scared. I never knew when they carried me into the ring to play Cupid.

"And I never woke up when pa pulled me out of the bag, and tried to posture me. I was as limp as a rag, and he could do nothing with me. The more he twisted and jerked me the harder I slept. Finally, he pulled me in front of his face, so the audience couldn't see what he was doing, and he gave me a terrible bite in the thigh. That woke me in a hurry, and as soon as I knew what was going on I stiffened, and the act went off all right.

"That was the beginning of seventy years," the "Governor" concluded, "in which I never knew any other kind of a life than that of a circus performer and owner, except for the time I served as an officer in the Federal Navy during the Civil War."

Thus did the "Governor" preface this series of what could just as well be captioned "three-in-one interviews" as anything else. He terms these conversations "cutting up old circus money." He means to say that he delved into his memory, and brought out of it to me tales of the doings of tent show folks and creatures who made a strange world among us—a place under the sun that as far as Americans generally are concerned always has been shut in by a shimmery curtain of mystery.

For the real history of the American circus is unwritten. It is true that outsiders have glimpsed some of the romantic and fascinating phases of the institution. But they never got at the true inwardness of things. That record has been handed down only by word of mouth from generation to generation of the Vagabonds of the Red Wagons. And it never strayed away from them to the rest of us, because circus people are a set to themselves. They have their own ways of thinking and doing, and even a language that is distinctively their own. They never have had much to say to any one who is not of their breed.

Therefore, first of all, what the "Governor" does in these interviews is to scatter broadcast some of the how and the why of the circus as an American institution. And while he is doing this, he also is turning loose a close-up of the everyday lives of our forefathers; what they thought, and what they did—whether they lived in New England, or nested in the heart of the romance land that is Louisiana; and whether they were of the hordes who made their way far in the direction of the crimson lair of the evening sun, or whether they were of the other hordes who stopped mid-continent during the era of our national expansion from the Atlantic toward the West. All of this was gone over without a bit of "yarning," because straightforwardness is as natural to the "Governor" as the swallowing of food when he is hungry.

The third angle is injected into these interviews by the man himself. Stripped of the press agent glory that surrounds circus owners, John F. Robinson is the most conspicuous natural figure in the tent show world. No other noted circus owner was "born in the business." No other man ever occupied a similar position in the history of canvas-sheltered amusements. And his is the only family in which for three generations a son took over the management of circus affairs where the father laid them down. More than a century ago his father, John the First, launched the enterprise. When he became weary, the "Governor" assumed the ownership of the aggregation. It then was the largest circus in the world, though it was but a motley group of scraggly wagons and uncouth entertainers. For fifty years he led his caravans into the penetralia of every sort of people to be found between the two oceans, and betwixt the tromboning waves of the Gulf and the Canadian border.

That is how he received his title of "Governor," by which he is known in every place where his circus could display its gorgeousness during the years when the nation grew like a lusty weed in black loam; he was the ruler of a sizeable wandering community.

And while he was doing this, the Robinson family and their show became so tangled in the traditions of political parties, of fine old Southern families, of little settlements, and of just plain places along the roads, like Chicago and Birmingham, that afterward became great cities, that they're homefolks wherever they happen to "light."

"I don't believe there is a place in the United States that I'm not personally known," the "Governor" said, after a pause to light his cigar.

"That question came up one time when the show was in California," he went on. "I came back here to winter quarters to spend a couple of weeks, and on my way to rejoin the show the subject of being universally known arose in conversation in the smoking room of the Pullman. I made the same statement there that I've just made to you.

"Later in the day, the train stopped on the prairie at a place where there was nothing but a sidetrack, and a section house where the trackmen kept their hand car—there were no other houses around that I could see. We drew into the siding to let another train pass us.

"While we were waiting for it to come, all of us in the Pullman got off to stretch our legs.

"'Robinson,' one of the passengers said as he looked around, 'here's a place where you won't find anybody who knows you.'

"'Yes, I guess that's so,' I replied, because it didn't look to me as if I would. There was nobody there.

"In a few minutes the eastbound train came along, and it stopped with a Pullman exactly opposite me. On the platform was a Negro porter who was the porter on my private car with the show the season before.

"'Hello, "Governor,"' he yelled to me, 'How's you all, and where's your circus?'

"So even out there in that forsaken place on the prairie I came across someone who knew me."

In turn, the "Governor" passed the circus into the control of his son, John the Third, and not long ago it sang its swan song. The motion picture industry claimed the energies of his son, and of the greater number of the wild beasts with the show. There no longer is a Robinson circus.

But during the hundred years that the Robinsons in succession carried their show over the highlands, and through the brooding forests; across the quivering swamps, and the solid surfaces of a country that had an appearance none of us ever will know except through hearsay, they devised one piece of circus paraphernalia after another as the necessity for it arose. Other circus owners adopted these improvements as they were made, and successfully tried out, until, in a large measure, if the equipment and methods of the modern circus are not exactly a Robinson idea, they at least have the Robinson base.

"A man who never has been through the experience," the "Governor" said as a preliminary to how all of this came about, "has no realization of what it meant to travel by wagons over the country when I was a boy, and up to 1870, when I put the show on

(Concluded on page 10)

One of the first clown bands attached to an American circus.

The "Gold Star Ship"

THERE is genuine inspiration in the plan of that American woman who is organizing a pilgrimage of the mothers of boys who fell in the war to their sons' graves in France. It is proposed to charter a ship, to be known as the "Gold Star Ship," for this purpose. This to begin with; but the idea is a much bigger one than the associated expression of grief and pride of 500 or so mothers of slain American soldiers.

What gives the project exceptional interest is the fact that it is proposed to make the sojourn of these bereaved American mothers on French soil the occasion for a striking dramatization of the deep desire and soul determination of the mothers of the world in a demand on the governments of the nations that there shall be no more war.

A great convention of representative mothers of sons done to death in the conflict, mothers from all the belligerent countries, is to be gathered in Paris. And this convention is to go definitely on record in protest against the bungling and the chicanery of the so-called statesmen and diplomats which every little while so callously and stupidly consign thousands and millions of the flower of the world's manhood to be cannon fodder while making desolate the hearts of the mothers of men.

Such a demonstration may do more than all the leagues and tribunals, with their arid wastes of oratory and wildernesses of casuistry, to bring about what all truly humane people want above all things.

Duly Executed by Military

SIX boys sentenced to death by court-martial for "levying war" against the British Government were "duly executed by the military" in Cork the other day. The boys, whose average age was 20 years, were shot in batches of two at fifteen-minute intervals. Five of the youngsters were accused of having attacked Crown forces a few weeks before, the sixth was shot for having a revolver and ammunition in his possession. It was the sentence of this last youngster that the Court of King's Bench had confirmed a few days before in its decision that "a state of war existed in Ireland," giving the military full power to act without interference of the civil courts. An appeal for clemency for the boys, unanimously signed by the council and aldermen of their home city, was rejected by the authorities. Although relatives immediately petitioned for leave to bury the bodies, they were taken away to the county jail and there destroyed in graves of quicklime.

This is the plain, bald recital of a single incident in the present upheaval in Ireland, as narrated by the Associated Press dispatches of February 28 last. To those whom familiarity with war brutality and slaughter had not made callous, the news must have conveyed some such shock of sickening horror as early in the war was aroused in all of us by stories of "Hun atrocities," or of outrage and massacre by "the unspeakable Turk."

There are several considerations to be taken into account, if the actual human and historical value of the incident is to be rightly weighed. Here are a few of the more obvious: These boys, slaughtered in cold blood for "levying war against the Crown forces," were accused not of warring against their own country, not against the government of their own country chosen by a majority of about 90 per cent of the voters of Ireland; but against what they regarded as a foreign invader ruthlessly and relentlessly putting their native land to fire and sword. Even the high judicial authorities of this "foreign invader" has declared that a "state of war" exists between Ireland and England. Legally and actually, this is undoubtedly the case. Why then were not these captured boys accorded at least the simple status of prisoners of war? Only a few months ago, a British general was captured by the Irish Republican troops, but he was not shot by them. On the contrary, he was scrupulously treated with all the consideration accorded to a prisoner of his rank in wars between civilized nations. At rare intervals during the Great War, charges were made on both sides of the killing of prisoners, and even hardened militarists denounced such butchery as the blackest of crimes and one in utter violation of even the scant decencies still demanded of belligerents.

We may take the stand that the millions of Americans of Irish blood and breeding must be Americans, and not Irish; nor seek to embroil their adopted country in the troubles of their former homeland. But even if there were not a single American of Irish blood in the United States, we could not shut our eyes to such doings in Ireland. Americans who are not Sinn Feiners, or narrow nationalists in any respect, will with difficulty repress a deep sense of disgust and revolt against a wanton slaughter that must outrage the elementary feelings of humanity the world over.

Belgium's Indebtedness

THE mere fact that acceptance by the United States of payment of the $170,000,000 advanced to Belgium up to the date of the armistice in German bonds of a special issue totaling $1,000,000,000, and to constitute a first lien on indemnity payments, as recommended to Congress by President Wilson, seems to have been sufficient to provoke partisan opposition of the pitiful sort that figured so much in the Senate's handling of the Peace Treaty. Having, while in Paris, joined the British and French premiers in an agreement to recommend such a settlement to their respective governments, it is difficult to see how Mr. Wilson could have done less than he has done in this matter.

The question, of course, is for Congress to decide and it is proper that it should go over to the incoming administration. But if the bonds are guaranteed by Britain and France, or even by Belgium alone, such a settlement would be one obviously to the advantage of this country, as it would give us additional security to that extent. With our acceptance of such German reparation bonds, naturally, should go some distinct assurance that such a settlement of the claims of the Allies will be made as Germany will be able to meet.

Altogether, instead of "embroiling" this country in European tangles, the proposed settlement of Belgium's debt to us would do much to straighten out existing tangles, encourage gallant little Belgium in her brave and sturdy effort toward reconstruction, and do much to restore that normal rate of exchange on which a revival of our export trade so much depends.

The People's Savings

ASSUMING that Congress sincerely desires to replace the business of the country on a normal basis, we may expect it to tackle in earnest, and early in the coming session, the task of reorganizing our Postal Savings System. For some time past it has been apparent that the present organization is falling far short of discharging the functions for which it was created. Total average deposits in the Postal Savings banks in 1918, for instance, were only $130,000,000, as compared with a total of $5,472,644,659 in private savings banks. It should be obvious that a rightly organized and administered postal savings system offering the workers of the land an absolutely safe depository for their surplus earnings, should attract more than one-fiftieth of the total savings deposits.

Such Postal Savings banks would prove a mighty encourager of thrift. It could, moreover, be made a factor of first importance in reconstituting the nation's finances on a sound basis, with all that means for the revival of the country's industries.

A noted financier urges that the rate of interest be raised to 4 per cent and that all the 55,000 post offices and sub-stations in the country be authorized to receive deposits, instead of the merely 6,500 offices now designated. It is suggested that these changes would bring in enough money in a year to pay off the floating indebtedness of the government, now amounting to $2,500,000,000.

It is about time that we caught up with European countries that have sense enough to provide the people an absolutely safe depository for their savings, paying to the depositor the full earnings of his money minus only actual administrative expenses.

Immigration and Arithmetic

THE Dillingham Bill just passed by the Senate to restrict immigration will tax the arithmetical talent of those organized forces concerned in bringing into this country very large representation of the racial elements depended on for the dilution of American national ideals and social standards. As amended in the Upper House, the number of immigrants to be admitted during the next three years is reduced to three per cent of the national elements present here in 1910.

Assuming that applicants during the next few years will be in the same proportions as were the applicants in 1913 to those already here in 1910, the rule would deny admission to 6,152 French people, 3,208 Dutch, 359 Swiss, 10,794 British and 225,000 Italians. On the other hand, it would admit twice as many Germans as were in the 1913 inflow, which is probably less than the number who would now like to come here. How the rule is to be interpreted in regard to immigrants from the former territories of the Russian and Austro-Hungarian empires presents complex questions which will be put up to the secretaries of State, Labor and Commerce for decision.

Now if the three million Jews in the United States were registered frankly and veraciously as Jews, instead of as Germans, Austrians, Russians, Poles, Bohemians, French, British and even "American," they might get in 90,000 of their distressed brethren of Eastern Europe—90,000 out of the 1,500,000 reported to be anxiously headed in this direction. As it is, they will have to figure on the total of Russian, Austrian and German natives shown in the census of 1910. Of course, they will take the total of these nationalities, Jew and Gentile; but, even then, the number eligible for admission to the soil of the American Republic will be much less than it would be save for the camouflage constantly practiced to conceal their numbers. So it may well be that the success of the Kehillah through its chief lobbyist, in preventing the recording in our census returns of Jews as Jews, may prove a boomerang.

Do You Use Life?

IN A FRAME, hung upon the wall in a prominent place in the reception room of a large banking house in New York, is the inscription:

"Do You Use Life, or Are You Just Letting Life Use You?"

What a world of thought is opened by this query. Are you one of those who are letting life use you? Are you simply drifting with the current? Or are you guiding your ship of destiny firmly and unwaveringly?

Many a man and woman are letting life use them without an effort to direct their course. They go along the highway of life aimlessly, with no special goal in view. They encounter difficulties which, had they been on the alert, they could have avoided. They let life use them as it will, the plaything of currents which they are too lazy to try to stem. When anything goes wrong, these people who are letting life use them shrug their shoulders and say, "Such is life."

Life has been given to each one of us to use, from the cradle to the grave, as we see fit. Obstacles may oppose, difficulties may arise, there are sure to be many dangers and trials to be encountered, but if we are determined that our life shall be molded according to our best desires, and that we will not become the creatures of circumstances, we shall win in the end. We can make of life what we will; we can be used by it, flung about and trampled upon, and at last go down to a nameless death.

Or we can take control and become the master of life, and guide it as we will. We can use it to make a better, a brighter and a happier world, not only for ourselves but for others with whom we may come in contact. We can so use life that when the end comes we shall have obeyed Bryant's parting injunction in Thanatopsis:

"So live that when thy summons comes to join
The innumerable caravan, that moves
To that mysterious realm where each shall take
His chamber in the silent halls of death,
Thou go not, like the quarry slave at night
Scourged to his dungeon; but, sustained and soothed
By an unfaltering trust, approach they grave
Like one who wraps the drapery of his couch
About him, and lies down to pleasant dreams."

Mr. Ford's Page

PITY the poor fellow who is so soft and flabby that he must always have "an atmosphere of good feeling" around him before he can do his work. There are such men. They produce with a sort of hothouse fervor while they are being coddled, but the moment the atmosphere chills and becomes critical they become perfectly helpless. And in the end, unless they obtain enough mental and moral hardiness to lift them out of their soft reliance on "feeling," they are failures. Not only are they business failures; they are character failures also; it is as if their bones never attained a sufficient degree of hardness to enable them to stand on their own feet.

There is altogether too much reliance on good feeling in our business organizations. People have too great a liking for working with the people they like. In the end it spoils a good many valuable qualities.

Don't misunderstand; when the term "good feeling" is used, it means that habit of making our personal likes and dislikes on purely affinitive and emotional grounds, the sole standard of judgment.

Suppose you don't like that man. Is that anything against him? It may be something against you. What has your like or dislike to do with the facts anyway? If you are a man of common sense you must know that there is many a man whom you dislike, whom you must admit is better than yourself.

When you were a lazy young fellow you probably disliked the boss who tried to keep you busy. When you were a careless, wasteful young sport, you probably disliked the wise old head who took you aside and told you how many kinds of a fool you were. When you got into business and settled into a rut, you probably disliked the progressive fellow who came along with some live-wire competition and made you get out and hustle again.

But what do these dislikes show? Simply what *you* were. That ought to be enough to make you careful to remember that your dislike always tells more about you than it does about the other fellow. Your dislike may be wrong about the other fellow, it is perfectly unmistakable in what it says concerning you.

Now, if you are one of those easy-going people who prefer to have a certain type of persons around you—just that type and no other—it is a sign of which you ought to take notice. There is a dangerous psychology in having only agreeable people around you; it is too much like a man reclining on cushions all the time. Some men like to have around them women who "understand" them, and men who agree with them, and friends who will always defer to them, and a public that will always say "Bravo" no matter what is done.

The worst of it is, a man can have just these things if he wants them. But they leave him without gristle and marrow-bone in the end.

You can have far too much harmony, especially in business. You can go too far in picking men because they harmonize with you in your nature. You can have so much harmony that there will not be any of the thrust and counter-thrust which means life, any of the competition or friction which means effort and progress.

It is one thing for an organization to be working harmoniously toward one object, but it is another thing for an organization to work harmoniously with each individual unit of itself.

Some organizations use up so much energy and time maintaining a feeling of harmony in themselves that they have no force left to work toward the object for which the organization was created.

The organization is secondary to the object. The only harmonious organization that is worth anything is an organization which is all bent on the one main purpose—not to get along *with* itself, but to get along *toward* the objective. A common purpose, honestly believed in, sincerely desired—that is the great harmonizing principle.

Now, if John Smith does not like James Jones, what does that matter? The main question is, does James Jones know his business? Can he advance this program toward its objective? Away with personalities! This trivial, unexplainable temper which turns to likes on one hand and to dislikes on the other; this apparently unreasonable and irresponsible influence of attraction and repulsion—these are stray mental phenomena which may have reasons and meanings in some spheres of our being, but the man who allows such feelings to be the sole judge of men and the sole determinant of his comfort in working with men, is certainly laying out trouble for himself.

The whole matter of harmony has been over-emphasized. Not only over-emphasized but wrongly based. Everybody has the idea that harmony means the various units of the organization getting along well with each other, after the manner of guests at a party. But that is not the basis of the harmony that achieves: the only basis for effective organizational harmony is a common belief in a common cause.

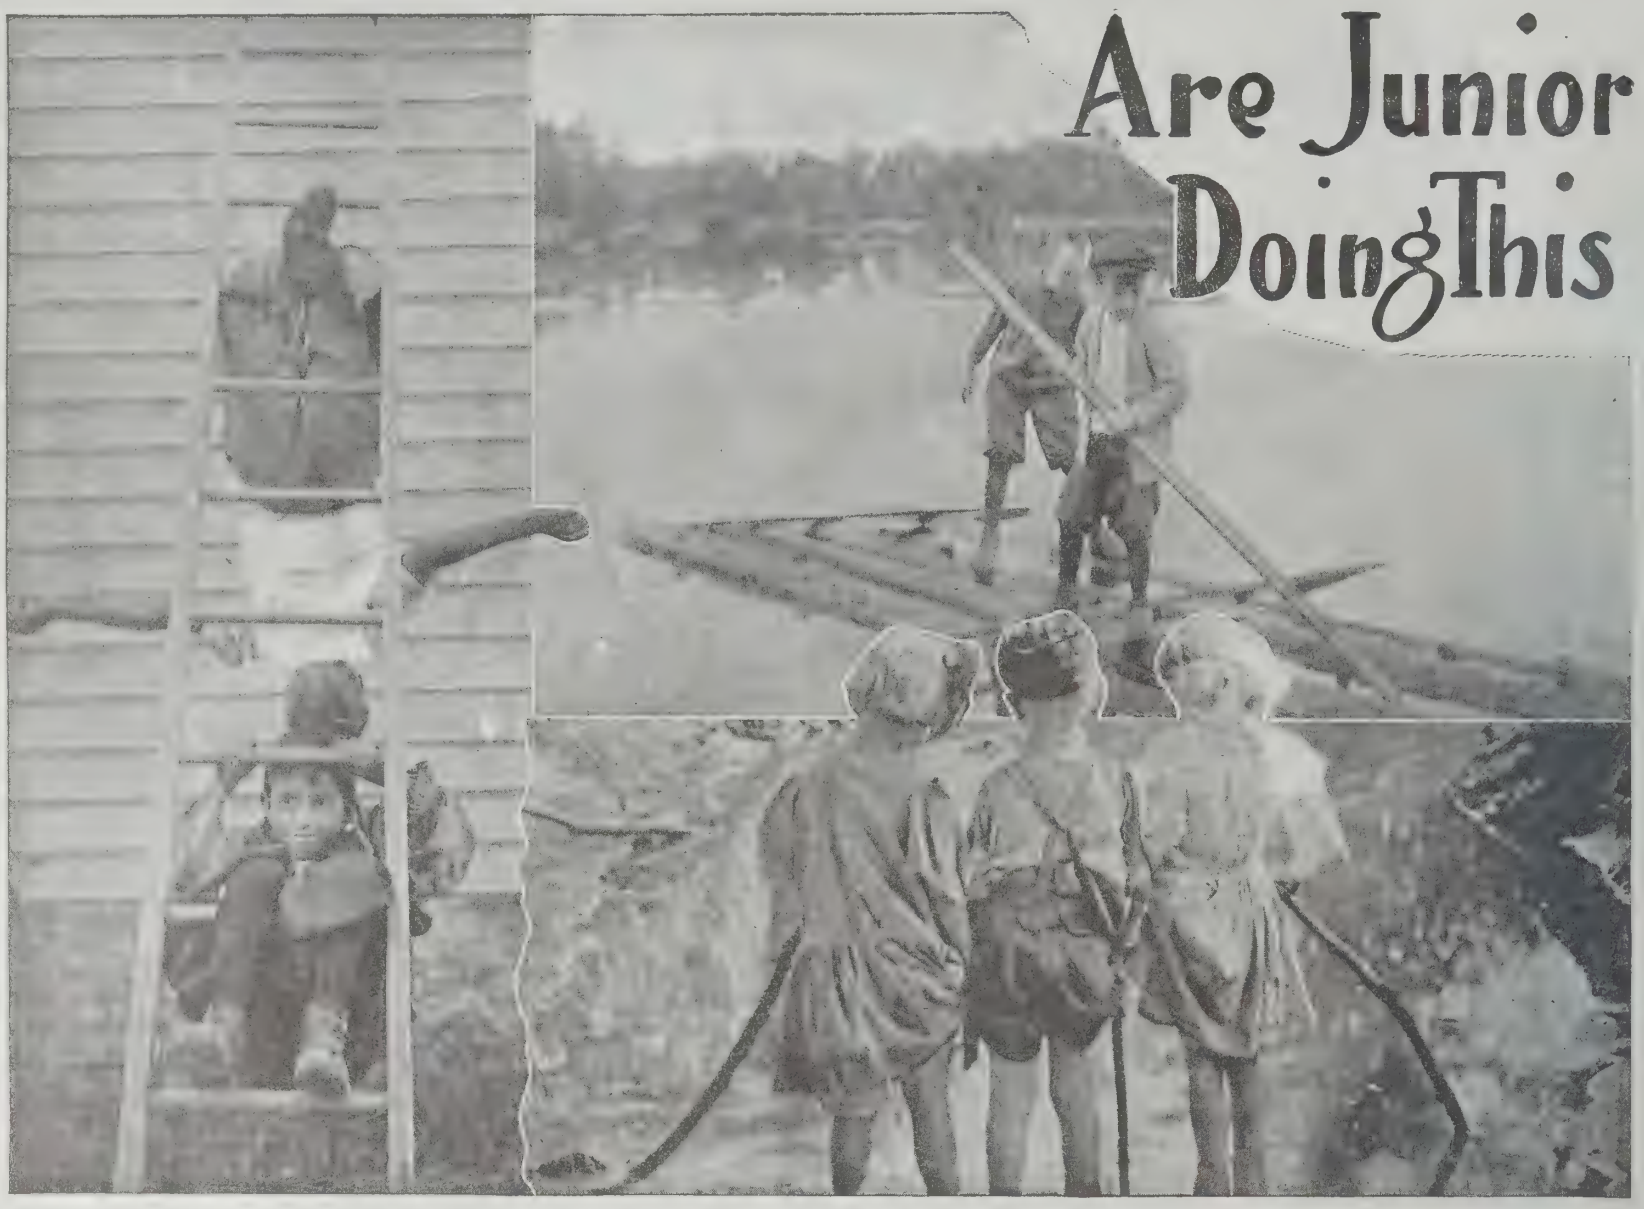
A certain amount of friction is a good thing everywhere—not antagonism, for that is waste; not jealousy, for that is infantile stupidity; not a selfish and unprincipled cutting under of another fellow—but frank, open understanding that on this job at least we stand for what we are and nothing more.

Everybody knows of businesses where fellows are being "held up" through friendship. The staff thinks that So-and-So is a good fellow, or the boss likes him, or he maintains a sort of position because he "is easy to get along with." But what about the business? For everybody thus being held up, someone is doing the holding up, and the business is burdened to hold up both of them.

An organization can be so perfectly "harmonious" that it has lost the power and the courage to prune itself of its own dead limbs.

An organization can be so perfectly "harmonious" that its only salvation depends on someone coming in and making it work with people it "doesn't like," and making it do work that it "doesn't like"—in short, making it amount to something by doing what it doesn't like.

Don't do all the things you like to do: and do most of the things you don't like to do; and then you will become a character strong enough to step out and accomplish things with men whom you don't like and who possibly don't like you.



The young man, especially the young business man, had better put this "like" stuff away from him entirely; it is as enervating as lolling among cushions all day. The wise manager will get most of his work done through men whom he doesn't like and who may not like him; all that is necessary is for him to know and respect their ability and dependability.

Men who know will agree with this: there is a stronger bond between men who respect each other for their strong qualities, than there is among men who "like" each other for their merely amiable qualities.

How would you measure a man's value? You reply, "By what he is worth." Not by what you think of him, that is, not by how you react to his personality in liking or dislike? "No." Very well. If that is the rule you follow, you will not be likely to do an injustice to your fellow-man by misjudging him, nor to do an injustice to yourself by fortifying the always human tendency to unreasonable prejudices.

If you feel yourself getting soft and ineffectual, get out where there will be no sympathy, no understanding, no admiration, but just plain challenge to do what is in you. That will brace you up.

THE emphasis on harmony in business organizations is all wrong. It is not necessary for men to like each other in order to work together. Be guided too much by your likes and dislikes and you will grow soft and flabby. Do things you don't like to do, work with people you don't like, and you will find it bracing. A little honest friction is necessary to the production of power. An organization can be so "harmonious" that it has neither the wisdom nor the courage to prune away its own dead wood. Some groups use up all their energy getting along with each other, instead of unifying themselves by pooling their energies in order to get along toward their goal. Harmony in human relations is a by-product of team-work on a job toward an objective. Harmony that does not strike fire occasionally is only for mollycoddles.

Are Junior Doing This

Lots of fun out behind the shed, but some mothers might be nervous could they see their Percies or Harolds perform on a ladder as an improvised bar. There is far less danger to life and limb on the properly cared for community playground.

Looks nice and makes a good picture. Yet would you permit your girl or boy to do this several miles from home? For how many such places are within reach of the average family living in the country town?

Above—Maybe some country towns have small lakes near by, or mill ponds. Granted. Could you as a parent wish your sons to use them for sailing? Would they be permitted to do as the lads shown here are doing?

Helping to Oust the Devil From the Small Town

By UTHAI VINCENT WILCOX

IT SEEMS like carrying coal to Newcastle to suggest that the children of the country towns need playgrounds in which to develop. "Why," says the heavy taxpayer, as he gasps his astonishment, "the town is so small, there's the creek right over there, and a lake over yonder, and there's the hills with canyons—why, why, when I was a boy—"

But that's just the trouble; Mr. Heavy Taxpayer and Mr. Conservative Citizen think in the terms of several decades ago when things perhaps were different. Still, in all reasonableness, there would be fewer criminals had there been places to play for the boys and girls of ten and fifteen years ago.

A frowzy-haired chap was indignantly expressing himself to a group of boys about him:

"Where we goin' to play? Mrs. Jones is afraid we'll hurt her hedge if the ball goes into it, and Old Man Dickson says we gotta' keep off his lawn, and you know what happens when we try to play on that empty lot over there by Castle's."

"It sure makes me sick!" answered one of them and by way of emphasizing that alleged sickness he threw down the ball hard enough to dent the hard-baked soil.

The rest of them hung about, pushing and jostling, expressing their indignation in one way and another until one of them spoke up:

"Aw, let's go over to Spud's shed, I'll show you somethin' that Speck gave me—some pictures!" And the accompanying wink indicated the kind of pictures expected.

The group of live, active boys averaging about twelve years of age left for the questionable indoor amusement of looking at certain pictures "given them."

And this was in a town of about 3,000. Yet many of the best fathers and mothers, teachers and Sunday school leaders would have been much surprised had it been suggested to them that their small city needed a regular playground. Because the town is small, and there are vacant fields within several blocks, even public-spirited citizens seem to feel that the boys and girls have everything needful properly to develop their physical and social natures.

Even casual investigations prove that as far as physical recreation is concerned the city brother and sister have access to certain advantages unknown to the country lad. There are the Y. M. C. A.'s, and the Y. W. C. A.'s, and municipal playgrounds, baths, sometimes improved beaches, always parks and certain playground supervision.

The small-town youth is fortunate (for it is indeed quite rare) to find a public school with adequate playgrounds worthy the name. Often the short recess periods must be spent in crowded quarters or on the streets adjoining. Check up this statement with the small cities that you know about.

Even "the wide country in which to roam" is not easy of access for the suburban child though it may surround his village. There are orchards, or grain planted, or pastures for stock, or estates laid out. The roaming will make trespassers of the roamers; even if this were not true the majority of children need more than mere hiking and tramping.

The Psalmist of old sung of the cattle on a thousand hills that belonged to the Lord, but by the works of man it seems that even in the village the boys and girls in their innocent search for joy and pleasure have fallen into the hand of the devil and his angels for they are controlled by most undesirable circumstances and unhealthy conditions.

Some small towns have endeavored to remedy this by providing places in which the children may play such games as baseball, football, tennis and the running games. Nor has this always been done by municipal authorities; more often by private interests who appreciate the trend of the times.

In Mountain View, California, a town of less than five thousand, a large publishing institution purchased two acres of ground and laid out a baseball diamond with back stop and bleachers. This is used not only by the employes of the institution but by the boys and girls of the neighborhood who have really needed some place where they can play during the afternoons. The way they have flocked to this open ground seems to have proved without much doubt the need that has existed.

On a recent Hallowe'en the local school board held a lantern parade and bonfire there for the benefit of the boys and girls. Those who desired to dress the parts so dear to children were given the chance to swoop about in their witches costumes, broomstick steeds, and pumpkin lanterns.

Certain games were planned that brought into active participation all of the children from the youngest to the oldest. With supervision by fathers who were still "older boys" something was doing every minute. The evening's outdoor fun concluded with the ascension of a balloon that had been made by some of the men who remembered the way they used to make them, aided and abetted by some of the "kids."

Of course the balloon, fitted with an oil-soaked string, turned turtle when the hot air had cooled, the string caused it to ignite and there was a bright spot in the heavens for an instant. The boys and girls and the parents too that were present all pronounced it "great" with a chorus of long-drawn-out "A-a-a-h-h-h's."

After the balloon had fallen in a trail of light against the night sky all were invited to the assembly hall of the publishing house where four reels of motion pictures were shown. There was, of course, no charge made for admittance, and all who could find places were welcomed. The favorite places were reserved for the children; parents and adults were asked to take the back seats. It was to be strictly a "kids' night." Some of the older folks remarked that "they had never seen so many boys and girls in the town before," and wondered where they all came from.

Every reel was appreciated, and when at about 10 o'clock the "Good Night" slide was thrown on the screen, boys and girls went home and to bed, tired from physical play, but with the sauce of mental food for a dessert.

It was noticeable that gates, doors, wagons,

and Sister – or this?

Above—Children of all ages like to swing.

Left—And the kiddies have their slide, made by the local builders. Installed in the vacant lot that has been set apart by the progressive men and women of one community, it's a rallying point for boys and girls.

Above—And the pole with the bar swings is good for shoulder and arm muscles.

Right—Let the girls be "boys" on the country playground.

wire mats and loose things were found intact the next morning. The town's night watchman declared that it was the quietest Hallowe'en he had ever seen in that town. There was no desire on the part of the boys and girls who were at the playground to "go on a tear" that night.

Ellwood City, a small town in Pennsylvania, is surrounded by beautiful fields, streams, canyons and hills. It would seem an ideal spot in which children could grow and develop. Yet the boys and girls of Ellwood for the most part had to play on the streets, or be "chased off" lawns, away from empty lots and places where fly balls might go through unprotected windows.

A tube company located there investigated conditions. They were looking to the future welfare of their own plant. The boys and even the girls that they would wish to employ in a few years were now on the streets, or in small back-yards, or acting as neighborhood terrors when they played "chase" over the residence sections. Others were endangering their own lives about the railroad tracks.

The tube company picked out two and one-half acres in a good location, the realty firm donated it rent free to find out the results of the experiment. The land was leveled, cleared of weeds and brush by volunteers from the local mill company.

Slides, swings, seesaws, sand-piles, volley ball courts and a wading pool were installed, together with drinking fountains.

Even before the place was ready the children came, and when at last thrown open more than one-third of the total school enrollment came out. Even the grown people spent whole days there, some even coming from two and three miles out in the country to bring their children to the place where they could "have a good time."

The factory men came during their noon hours for simple recreation such as volley ball, pitching horseshoes, or some form of baseball.

The community center, as it rapidly grew to be, is supported by the board of trade; public collections are taken to add to its advantages.

The experiments conducted by these two widely separated towns are illustrative of the results that may be expected. Both places have found the plan beneficial to the children, inasmuch as they learned how to play unselfishly and without fear of prohibitions against strenuous exercises and shouting. Some of the children have developed into leaders, that would never have become such without the playground. Others have learned how to play. Paradoxical as it may appear, all boys and girls do not know how to do this. It is not infrequent to find a timid child that has been cheated of this birthright by parents who have exercised the over-restrictive "don't."

New games were taught by the "old boys" and the "old girls" and a wide variety of healthful physical exercises were introduced that reacted against certain vicious tendencies among some children to adjourn to barns and alleys for unhealthy discussions.

Boys who swore and used bad language were instructed to abandon it or lose the chance to come on the grounds. This generally had a good effect.

The foreign elements were also benefited. (What American city is there that does not have some kind of a foreign population?) Three little Magyar sisters came to the playground. They wore dirty clothes and were most unlovely in appearance. It was observed that in but a little over a week these children had cleaned up, lost their sullen appearance and were mingling with the others on more equal terms.

The playground is one of the best "melting pots" that could be conceived for the boys and girls of the immigrants who are turning to America in such large numbers. Teach their children under wise supervision and in but a short time the parents will be taught, too.

As for the parents of these two communities, they felt greatly relieved. At last there was a place where their children might work off some of "their animal life" as one mother expressed it. The wading pool permitted the mothers to rest easy, for away from uncertain creek bottoms and river currents, one hundred of the small children learned how to swim. "It was far better," so one conscientious mother said, "for Robert to be with a large number of others and in some open space playing darebase than to be in someone's backyard, or out on the streets or highways."

Now, why may not the thousands of other small towns reap some of the benefits of the cities? Not even an expensive equipment is needed. It is not necessary to go as far as did the tube company of Pennsylvania. Any energetic group of people—fathers and mothers, improvement clubs and associations—may rent or lease a field or vacant lot.

Later, the parents or older boys may add swings, bars, and lay out diamonds; but every small city needs a healthy place where the active juniors may feel free to exercise strenuously.

Make the towns attractive, give them some of the advantages such as have been described and the exodus to the great metropolitan districts will slacken. Perhaps it has been because the suburban localities have failed to provide proper places for the growing generations that the homely but sometimes too true expression has been repeated so often, that "man made the cities, God made the country, but the devil the small town." Cannot man, working with God, encroach upon this supposed exclusive territory of the evil one and give the small-town dweller the benefits of *both* country and city?

The ideal? The future welfare of our democracy and the church. The sculptor works upon marble and knows that ultimately it will perish. The foundry man molds in brass and knows that time will efface the delicate effects. The architect conceives great temples and knows that they will burn or crumble, but it is the privilege of the common man and woman—you and I—to work with developing souls of boys and girls that will in turn brighten all eternity.

"Jewish Rights" Clash With American Rights

The Demands Made by Jews in Scores of American Communities Throw a Strong Light on Jewish Conception of their "Rights" in This Country

IT IS well that the public should understand that the present study of the Jewish Question in the United States is not based upon religious differences. The religious element does not enter except when it is injected by the Jews themselves. And it is injected in three ways: First, in their allegation that any study of the Jews is "religious persecution"; second, by their own records of what their activities in the United States consist of; third, by the impression which is very misleading if not corrected, that the Jews are the Old Testament people of the Old Testament religion which is so highly regarded in the Christian world. The Jews are not the Old Testament people, and the Old Testament, their Bible, can be found among them only with difficulty. They are a Talmudical people who have preferred the volumes of rabbinical speculation to the words of their ancient Prophets.

The note of religion does not enter this discussion until the Jews place it there. In this series of articles we have set aside every non-Jewish statement on this question, and have accepted only that which proceeds from recognized Jewish sources. It has been more than a surprise, in studying the proceedings of the New York Kehillah and the American Jewish Committee and their affiliated organizations, as represented by their activities throughout the country, to learn how large a part of these activities have a religious bearing, as being directly and combatively anti-Christian.

That is to say, when the Jews set forth in the public charters and constitutions of their organizations that their only purpose is to "protect Jewish rights," and when the public asks what are these "Jewish rights" which need protection in this free country, the answer can be found only in the actions which the Jews take to secure that "protection." The actions interpret the words. And thus interpreted, "Jewish rights" seem to be summed up in the "right" to banish everything from their sight and hearing that even suggests Christianity or its Founder. It is just there, from the Jewish side, that religious intolerance makes its appearance.

What follows in the course of this article is nothing less nor more than a group of citations from Jewish records covering a number of years. It is given here partly as an answer to the charge that this series of articles is "religious persecution," and partly to help interpret by official actions the official Jewish program in the United States.

"Christological Expressions" Taboo

AN IMPORTANT fact is that previous to the formation of the Kehillah and the Jewish Committee, this sort of attack on the rights of Americans was sporadic, but since 1906 it has increased in number and insistence. Heretofore it has gone unheeded by the public as a whole because of our general tolerance in this country, but from this time forth the country will possess information that what it has been tolerating is intolerance itself. Under cover of the ideal of Liberty we have given certain people liberty to attack liberty. We ought at least to know when that is being done.

Look rapidly down the years and see one phase of that attack. It is the attack on Christianity.

That is rather a hard thing to set down in writing in this country, and it would not be set down did not the facts compel it. Jewish writers nowadays show a great deal of anxiety that non-Jews should follow certain Christian doctrines. "We gave you your Savior, and he told you to love your enemies; why don't you love us?" is the implication with which their statements usually come.

However, here are a few items from the record: They are recorded according to the Jewish calendar (our modern calendar is "Christian," and therefore taboo) but here both calendar dates shall be supplied.

5661 (A. D. 1899-1900) The Jews attempt to have the word "Christian" removed from the Bill of Rights of the State of Virginia.

5667 (A. D. 1906-1907) The Jews of Oklahoma petition the Constitutional Convention protesting that the acknowledgment of Christ in the new state constitution then being formulated would be repugnant to the Constitution of the United States.

5668 (A. D. 1907-1908) Widespread demand by the Jews during this year for the complete secularization of the public institutions of this country, as a part of the demand of the Jews for their constitutional rights. —Supreme Court Justice Brewer's statement that this is a Christian country widely controverted by Jewish rabbis and publications.

5669 (A. D. 1908-1909) Protests made to governor of Arkansas against "Christological expressions" employed by him in his Thanksgiving Day proclamation, 1908.—Professor Gotthard Deutsch protests against "Christological prayers" at the high school graduating exercises at Cincinnati.

5673 (A. D. 1912-1913) The alarming growth of the Jewish population in New York makes it necessary for business men advertising for clerks or secretaries, or housewives advertising for help, to specify where Jewish help was not desired, otherwise the flood of Jewish applicants was overwhelming. The expressions "Christian preferred," or "Jews please do not apply" are used. This year the New York Kehillah takes the matter in hand stating that "these advertisements indicate an alarming growth of discrimination against the Jews and it is remarkable that many firms which cater to the trade of Jews display this form of prejudice."

5679 (A. D. 1918-1919) The American Jewish Committee took up the alleged discrimination against Jews by army contractors. Louis Marshall, president of the Committee, notified Newton D. Baker, Secretary of War, that advertisements had appeared calling for carpenters to work in government camps, and that the advertisements required the applicants to be Christians. Secretary Baker replied that he had made an order prohibiting contractors from making this discrimination. (On the whole, this special form of advertisement may appear rather stupid: how many Jewish carpenters are there? Not enough to discriminate against. But there were doubtless other reasons.)

May Say "Jew" But Not "Christian"

PROVOST MARSHAL CROWDER, in charge of the Selective Draft, had issued an order to all medical examiners, under direction of the Surgeon General, stating "The foreign-born, especially Jews, are more apt to malinger than the native-born," and Louis Marshall again telegraphed both the Provost Marshal and the Surgeon General demanding that *"the further use of this form shall be at once discontinued; that every copy of it that has been issued should be recalled by telegram; and that proper explanations be made, so as to expunge from the archives of the United States the unwarranted stigma upon three millions of people."*

It was President Wilson, however, who eventually ordered the excision of this paragraph.

The United States Shipping Board sent an advertisement to the New York *Times* calling for a file clerk and stating that a "Christian" (by which is always meant a non-Jew) was preferred. The ad was not published as written; it was changed so that it requested applicants to state their religion and nationality. This last form would seem to be far more objectionable than the other. In the first instance the employer states fairly what he wants. In the second instance the applicant is compelled to divulge certain facts about himself in utter ignorance of the employer's preference. In the first instance, only the two classes that can do business get together; in the second instance there is no clearness about the situation until much useless effort is undertaken. Why? Because the Kehillah demands it. And why does the Kehillah demand it? Because, while it is all right for a Jew to remember that he is a Jew, it is not all right for you to remember it.

When Louis Marshall Protests

SO, LOUIS MARSHALL got into action again with the Shipping Board, this time with certain drastic demands. Strangely enough, the protest was lodged through Bainbridge Colby, who was Woodrow Wilson's last Secretary of State. Mr. Marshall demanded: "Not because of any desire for inflicting punishment, but *for the sake of example and the establishment of a necessary precedent, this offense should be followed by a dismissal from the public service of the offender, and the public should be informed of the reason."*

Attention is particularly called to the tone which Mr. Marshall adopts when addressing high American officials in the name of the Jewish Committee. It is not to be duplicated in the addresses of any other representatives of other nationalities or faiths.

Unfortunately for Mr. Marshall's plan of punishment, the object of his wrath was found to be a woman, and she was not discharged, although the Jewish Committee got an apology from Charles M. Schwab.

The Federal Reserve Bank and Liberty Loan Committee also got in wrong when an advertisement was printed calling for a "Stenographer for the Liberty Loan Committee (Christian)." Protest was made to Benjamin Strong, governor of the Federal Reserve Bank and chairman of the Liberty Loan Committee, and the advertisement was withdrawn. But this was not enough. Secretary of the Treasury McAdoo was also drawn in to express his "reprobation for an unpatriotic act."

An officer in the Quartermaster's Department replied to a young woman who applied for the position of secretary to him that he preferred not to have Jews on his office staff. He was reprimanded upon the request of Mr. Marshall.

The Plattsburg Manual, published for officers in the United States officers' training camps, contained the statement that "the ideal officer is a Christian gentleman." Mr. Marshall at once made the standard protest against all "Christological manifestations," and the Manual was changed to read "the ideal gentleman is a *courteous* gentleman."

5680 (A. D. 1919-1920) In this year the Kehillah was so successful in its New York campaign that it was possible for a Jewish advertiser in New York to say that he wanted Jewish help, but it was not possible for a non-Jewish advertiser to state his non-Jewish preference. This is a sidelight both on Jewish reasonableness and Jewish power.

One gathers that a few people are still hugging the delusion that there is no Jewish Question in the United States. But another glance down the records will show the most prejudiced person that there is such a Question. If space permitted, the few details added below could be matched by a sufficient number to overflow all the pages of this paper.

5668 (A. D. 1907-1908) Jews agitate in many cities against Bible reading, Christmas celebrations or carols in many cities. In Philadelphia, Cincinnati, St. Paul and New York the Jewish opposition to the carols is met with strong counter-movements.

5669 (A. D. 1908-1909) Jewish Community at Tamaqua, Pennsylvania, defeats resolution providing daily Bible reading in the schools.—Jews attempting same compulsion in New Jersey are met with decision that pupils may absent themselves from devotional exercises.—Jewish agitation in Louisiana stirs ministerial association to defend the right of the school to the Bible.—Local council of Jewish Women of Baltimore petitions school board to prohibit Christmas exercises.—On demand of Edwin Wolf, Jewish member, Philadelphia school board prohibits Christmas exercises.—Jews present bills asking that New York Hebrews be permitted to ply trades and businesses on Sunday. Interdenominational Ministers' Conference takes official action and Rev. Dr. David J. Burrell, of the Marble Collegiate Church, states that the attempts of Jews to undermine the sanctity of Sunday are ethically unjustified.

The Lord's Prayer "Anti-Semitic"

5670 (A D. 1909-1910) On demand of Jews the school board of Bridgeport, Pennsylvania, votes to discontinue the recitation of The Lord's Prayer in the schools.—In Kentucky State Senate, Jews defeat the Tichenor Bill making the Bible a book eligible for the schools.

5671 (A. D. 1910-1911) Jews oppose Bible reading and singing of hymns in Detroit schools.—New York State Federation of Labor opposes Jewish Bill to exempt Jews from prosecution for violating Sunday laws. (The workingman knows that it means a 7-day week for the Goy!)—New York Kehillah does two contradictory things; favors bill to permit Jews to do all kinds of business on Sunday, and pledges itself to co-operate in the strict enforcement of the Sunday laws.

5672 (A. D. 1911-1912) Upon the urgence of two Jews the Hartford, Connecticut, school board votes on the question of abolishing all religious exercises in the schools. The motion is lost by 5 to 4.—Jewish pupils in a Passiac, New Jersey, school petition the board of education to eliminate the Bible and all Christian songs

from the school.—At the request of a rabbi, three principals of Roxbury, Massachusetts, public schools agree to banish the Christmas tree and omit all references to the season in their schools.—Jewish pupils of Plainfield, New Jersey, petition the abolition of the Bible and Christian songs from the schools.—The Council of the University Settlement, at the request of the New York Kehillah and the Federation of Rumanian Jews, adopts this resolution: "That in holiday celebrations held annually by the Kindergarten Association at the University Settlement every feature of any sectarian character, including Christmas trees, Christmas programs and Christmas songs, and so on, shall be eliminated."—Philadelphia Kehillah demands that Jews be exempted from operation of the Sunday laws.—In the *Outlook,* Dr. Lyman Abbott advises an inquiring schoolmaster that he is under no moral obligation to admit Jews to his private school.—A Jewish delegate to the Ohio Constitutional Convention suggests that the constitution be made to forbid religious references in the schools.—Jewish merchants of Paterson, New Jersey, petition for exemption from the Sunday laws.—Board of education of Yonkers, New York, denies Jewish request to forbid singing of Christian songs in the schoc s.

The Chaplain's Insignia "Anti-Semitic"

5673 (A. D. 1912-1913) Annual Convention Independent Order of B'nai B'rith at Nashville, Tennessee, adopts resolution against reading the Bible and singing Christian songs in public schools.—Jews at Jackson, Tennessee, seek an injunction to prevent the reading of the Bible in city schools.—Jews of Nashville, Tennessee, petition board of education against Bible and Christian songs.—Richmond, Virginia, school board restores Bible reading to the schools.—Bill introduced into Pennsylvania legislature providing for Bible reading in schools and the discharge of teachers omitting to do so. Jewish rabbis protest against bill. Jewish Kehillah of Philadelphia sends telegram to governor urging him to veto bill. Governor approves bill.—Chicago board of education, scene of much Jewish agitation, approves recommendation of sub-committee to remove Christmas from the list of official holidays in public schools.—In response to demands of Jews the Revere, Massachusetts, school board consents to remove references to Jesus from Christmas exercises in the public schools. This action, however, was rescinded at a special meeting.—California Jews appear before Senate Committee on Public Morals to protest against a proposed Sunday law.—At Passaic, New Jersey, 29 Jewish members of the senior high school class walk out of class election, alleging "racial discrimination."—At Atlantic City, New Jersey, *during the national convention of the United States War Veterans, the proposal to restore the Cross as part of the insignia of chaplain,* was defeated by Jews.

5674 (A. D. 1913-1914) This year the energies of the Jewish powers were concentrated on the task of preventing the United States from changing the immigration laws in a manner to protect the country from undesirable aliens.

5675 (A. D. 1914-1915) Jewish rabbi demands of California state superintendent of public instruction that some verses appearing in school readers be eliminated.—New York Kehillah concerns itself with attempts to secure modification of the Sunday laws.

5676 (A. D. 1915-1916) This year occupied by opposition to various movements toward making the schools free to use the Bible, and in opposition to the Gary system. The Gary system receives a great deal of attention from the Jews this year.

5677 (A. D. 1916-1917) Jews are busy carrying out an immense campaign against the "literacy clause" of the immigration bill.

The Third Phase of the Program

AND so it goes on. The incidents quoted are typical, not occasional. They represent what is transpiring all the time in the United States as the Jews pursue their "rights." There is no interference whatever with Jewish ways and manners. The Jew may use his own calendar, keep his own days, observe his own form of worship, live in his own ghetto, exist on a dietary principle all his own, slaughter his cattle in a manner of which no one who knows about it can approve—he can do all these things without molestation, without the slightest question of his right in them. But the non-Jew is now the "persecuted" one. He must do everything the way the Jew wants it done; if not, he is "infringing on Jewish rights."

Americans are very sensitive about infringing on other people's rights. The Jews might have gone on for a long time had they not overplayed their hand. What the people are now coming to see is that it is American rights that have been interfered with, and the interference has been made with the assistance of their own broad-mindedness. The Jews' interference with the religion of the others, and the Jews' determination to wipe out of public life every sign of the predominent Christian character of the United States, is the only active form of religious intolerance in the country today.

But there is still another phase of this matter. Not content with the fullest liberty to follow their own faith in peace and quietness, in a country where none dares make them afraid, the Jews declare—we read it in their activities—that every sight and sound of anything Christian is an invasion of their peace and quietness, and so they stamp it out wherever they can reach it through political means. To what lengths this spirit may run is shown in the prophecies of the Talmud, and in the "reforms" undertaken by the Bolsheviki of Russia and Austria.

But even that is not all; not content with their own liberty, not content with "the secularization," which means the de-Christianization of all public institutions, the third step observable in Jewish activities is the actual exaltation of Judaism as a recognized and specially privileged system. The program is the now familiar one wherever the Jewish Program is found: first, establishment; second, destruction of all that is non-Jewish or anti-Jewish; third, exaltation of Judaism in all its phases.

Put the Lord's Prayer and certain Shakespeare plays out of the public schools; but put Jewish courts in the public buildings—that is the way it works. Secularization is preparat ·v to Judaization.

The New York Kehillah is an illustration of how it is all done, and the American Jewish Committee is an illustration of the type of men who do it.

Imposing Jewish Customs on Americans

NOW for illustrations of the third phase of the program of "defending Jewish rights."

The year 5669 (A. D. 1908-1909) was marked by an effort to introduce the idea of the Jewish Sabbath into public business. Jews refused to sit as jurors in court, thus postponing cases. Boycotts were instituted in New York against merchants who opened on Saturday. That this campaign has borne fruit is known by all travelers in eastern cities who notice that even large department stores are closed on Saturday.

The year 5670 (A. D. 1909-1910) was dedicated apparently to the work of introducing the idea of Jewish national holidays into public life. This question lately rose in New York in a threatening way, but was withdrawn just before the breaking point. Only temporarily withdrawn, however. The feint revealed the identity and number of those who are still on guard against the complete Judaization of their city.—Jewish members of stock exchanges endeavored to have these institutions recognize Yom Kippur by closing; in Cleveland this was done.—The Council of Jewish Women appealed to the Civil Service Commission at Washington for recognition of Jewish holidays.—In Newark, New Jersey, the rabbis ask the night schools to discontinue Friday evening sessions, because the Jewish Sabbath begins at sundown on Friday.

In 1911 an attempt to have Hebrew officially recognized was frustrated by Supreme Court Judge Goff who refused incorporation of "Agudath Achim Kahal Adath Jeshurun" on the ground that the title should be in English.—Chicago Jews have election date changed because the official date fell on the last day of the Passover.

In 1912-1913 a number of special recognitions of the Saturday Sabbath were obtained, including Jersey City, Bayonne, Hoboken, Union Hill. In the Ohio legislature the Jews defeated a bill fixing a certain Saturday as the date of a primary election.

In 1913-1914 the United States Bureau of Immigration granted the request of Simon Wolf, long-time Jewish lobbyist at Washington, that instructions be given the Immigration Commissioners that no Jews be deported on Jewish holidays.—The Women's Party of Cook County, Illinois, passes resolutions against allowing Jewish teachers to draw full pay for absence during Jewish holidays.—In this year also the question of the Jews' method of slaughtering animals—the Shehitah—was brought forward. The American Jewish Committee thought this question of sufficient importance to engage its full interest.

This series of facts could also be pursued at length. Kosher food for the children of public schools because there were Jewish children in the schools; protest against the Daylight Saving Ordinance because they were prejudicial to Jewish merchants who close their businesses on Saturday and open them after nightfall on that day. This is an illustration of the large number of small points at which Jewish life conflicts with community life. And, of course, each of these divergences is ground for an imperious "demand."—Harvard University was severely criticized in 1917-1918 for refusing to set aside an entrance examination date that conflicted with a Jewish holiday. Since that time, however, eastern universities have become more pliable. But the whole course of the Christian year would have to be changed and all the traditional seasonal customs of the country broken up if the Jews are to be given the full measure of "liberty" which they demand.

Of course, the work of the Kehillah is claimed to be "educational." It certainly is that. The best educated members are those who come from the ghettos of Galatia where the Kehillah idea is fully understood and the Jewish community government exercises unrestricted sway.

The Profane Ways of the Goyim

WHATEVER other phase of education the Kehillah may be interested in, it certainly stresses most *the education to separateness.* The New York *Times* especially likes to emphasize this matter of "education." It is a convenient description and somewhat aids the effort to minimize Kehillah's importance when it is under scrutiny. Nevertheless in the New York *Times* an article appeared about the Kehillah in which Dr. S. Benderly, director of the Bureau of Education, is quoted as describing the objects of the education:

> "The problem before us was to form a body of young *Jews who should be on the one hand true Americans,* a part of this Republic, with an intense interest in upbuilding American ideals: *and yet, on the other hand, be also Jews* in love with the best of their own ideals, and *not anxious merely to merge with the rest and disappear among them.*
>
> "That problem confronts Orthodox and Reform Jews alike. It is *not merely a religious but a civic problem.*"

That is separatism and exclusivism as an educational program, and its results cannot help being a cloud of difference such as this article has in part disclosed. The New York Kehillah, through its Bureau of Education, is giving "a purely religious training to 200,000 Jewish children," the religious training being, of course, not what is generally understood by that term, but a training in ideas of racial superiority and separateness.

This difference is strikingly illustrated in Jewish fiction recently. To love a Christian maiden is sinful; this is the theme of all sorts of stories, sketches and editorials appearing these days. But James Gibbons Huneker, in a sketch extravagantly praised by Jewish critics, shows how deep this idea of separateness is when he makes Yaankely Ostrowicz say: "As a child I trembled at the sound of music and was taught to put my fingers in my ears when *profane music,* Goy music, was played." This is the root idea: All Gentile life and institutions are "profane." It is the Jews' unceasing consciousness of the Goy that constitutes the disease of Judaism, this century-long tradition of separateness.

The Menace of Anti-Gentilism

THERE is no such thing as anti-Semitism. There is, however, much anti-Goyism. In England, Germany, France, America, Russia, there is no anti-Arab sentiment of which anyone knows. None of the Semite peoples have been distinguished by the special dislike of any other people. There is no reason why anyone should dislike the Semites.

It is very strange, however, that the Semitic peoples should be a unit in disliking the Jews. Palestine, which still has only a handful of Jews, is peopled by Semites who so thoroughly dislike the Jews that serious complications are threatening the Zionistic advances being made there. This surely is not anti-Semitism. Semites are not against Semites. But they are at odds with Jews.

When Aryan and Semite are kept conscious through many centuries that the Jew is another race, and when it is known that neither Aryan nor Semite are touchy on the race question, what is the answer? Only this, that the whole substance of such a situation must be supplied by the Jews.

There is no such thing as anti-Semitism. There is only a very little and a very mild anti-Jewism. But a study of Jewish publications, books, pamphlets, declarations, constitutions and charters, as well as a study of organized Jewish action in this and other countries, indicates that there is a tremendous amount of anti-Goyism, or anti-Gentilism.

Not that it is anything to fear. It is, however, something to know. Knowledge is a good defense. The New York Kehillah, having as its executive committee the same committee which is also the ruling group of Jews known as District XII of the American Jewish Committee, is worth consideration, not only as an illustration of the interlaced organization which combines all classes of Jews in one group, but also as an illustration of what is meant by "Jewish rights."

It is worth remembering that every "demand" voiced in Washington before officials and committees, that every high personage that appears there on Jewish matters—the Louis Marshalls and the Wises, the Goldfogles, the Rosalskis, besides many others, like the Kahns and the Schiffs, who keep out of the committee limelight and away from the protesting parties, are all linked up, through this Jewish interest or that, with the main interest which is based on the Kehillah and expresses itself through District XII of the American Jewish Committee.

"Cutting Up Old Circus Money"

Concluded from page 3

the railroads. Even the smallest towns were great distances apart, and half of the time there were no roads. We had to send a pilot wagon with half a dozen men in it to make a road for the other wagons. The performers rode horseback or in buggies, and sometimes it took us a night and a day to get from one place to another. Then we ate and slept in the woods.

"In the towns we went to taverns, but they weren't very much better than the woods. They never had more than two or three bedrooms. The women slept in one of them, and the men in the others. Instead of having beds for us to sleep on, the tavern keepers threw straw on the floors, covered it with muslin, and we furnished our own pillows. About all that we had to eat was salt pork, swimming in its own grease, and corn bread. At that time there was plenty of game in the woods, but we never got it cooked at the taverns. And the coffee! Mostly made of parched corn, and sometimes of parched barley.

"We had an awful time with the wagons. They always were getting hopelessly stuck in the mud. Then we would throw everything out of them, and abandon the stuff. It was a common thing to abandon the tent poles, because we always could cut more of them on the edges of the towns.

"But there was one wagon that came through in spite of the mud or anything else. That was the ring curb wagon. The ring was formed then by a wooden curb, and it took one wagon and team to haul it. No matter what happened, or how deep that wagon got stuck, it was taken over the roads in one way or another.

"One night, however, down in the swamps of Florida in the late 40's, it got stuck for keeps. We couldn't budge it. Against all circus precedents we took the curb out, and left it in the woods. Next day when it came time to show, it looked for a while as if we would have to go back and get it. No performer felt that he could go on with his act without it, because it never had been done before.

"Well, pa raved around for a while, then he sent to the general store for picks and shovels. He measured off the diameter of the ring, and built the first circus ring made by throwing up an embankment of earth. We always used the idea after that, and then other shows took it up. No doubt, it has saved many a nasty injury to performers, because if they fell against the wooden curb they were pretty sure to get hurt.

"And then the lighting arrangements were another thing we had to contend with. Pa used candles—all shows did then—and he kept it up for a good many years, until I was old enough to take a hand in affairs.

"We had frames with sconces in them, and we put the candles in the sconces. They caught the grease, and that grease made up the salary of the chandelier man—he collected it and sold it.

"There were a lot of nights during the season then when we didn't show. The places weren't big enough to make it pay to show only in the afternoon, and some of the wagons would always be delayed. Generally the chandelier wagon was one of them, because it was the last to leave the lot, and the last to arrive in the next town, because the other wagons were more important.

"One night, down in Mississippi, when we were late in getting into the settlement, pa used his ingenuity. The first of the baggage wagons didn't get there until dark, but the crowd was waiting for us, and pa didn't have time to get the tent up. So he took the side canvas, and ran it around from one tree to another.

"Half of the show wasn't there when it came time to open the doors. One of the delayed wagons held the chandeliers. In laying out the ring there were so many fat pine stumps on the lot that pa laid it out so that the ring bank would hit a stump here and there. When we opened the doors there wasn't any light, so pa set fire to the stumps inside of the enclosure, and built fires on the tops of the stumps inside of the ring. But with all of that fire it was so dark that when I rode my horse pa would have to tell me when I had to jump over the banners. I couldn't see them. I was a very, very small boy then, but I never have heard of anything so crude being used to light a circus."

Interviews with the "Governor" are bound to be rambling affairs. One incident suggests another to him, and sometimes the second event occurred years after the first. And sometimes the connection isn't always clear to any one else. For that reason he provides a variety of narratives that, with his somewhat Southern drawl and slurring of his "r's" gives unusual charm to what he has to say.

"I guess there are a lot of grandmothers down in Louisiana this very evening who remember the night show I gave years later at Clinton, near Baton Rouge," he said, and chuckled.

"We were still traveling by wagon, and I was going to close the season the next day at Baton Rouge, and ship the show to Cincinnati by steamboat," he said.

"We hadn't been showing at night for a good while—only in the afternoon, because the places were too small. But Clinton had a female college. The young ladies couldn't attend the show in the afternoon, and I concluded to give a night performance for their special benefit—there was enough of them to make it pay.

"After supper the chandelier man came to me, and asked how I was going to light the canvas.

"'Why, with lamps, of course,' I told him. Some years before that we were the first circus to abandon candles for coal oil illumination.

"'The lamps ain't here,' he said, 'and I can't find them any place.'

"'Well, what did you do with them?' I asked him. 'This is the first that I've heard of them being gone.'

"'They ain't in the wagon,' he replied, 'and I don't know where they are. I guess somebody forgot to bring them along, or else they throwed 'em out of the wagon to make it lighter to get through a mud hole.'

"Well, I was in a fine fix then. All at once it struck me that I could use candles. So I told the men to get some narrow boards, about three or four inches wide, and drive three or four nails in little circles all along the planks. Then we put some candles I bought in the town into those circles.

"A good many of the young ladies never had seen a circus before, nor a wild animal, and they looked forward to the evening's entertainment as quite a treat. They came to the show in a body.

"After they went through the menagerie tent, and started through the connection canvas into the Big Top, they stood still in amazement, looking at the illumination. I never felt so chagrined in my life, nor so elated, as I did when they commenced to praise it.

"'Isn't it grand?' one girl would say to another.

"'My, isn't it splendid!' she answered.

"'I wouldn't have believed it to be possible,' they would say, and they were in earnest about it as they walked up the seats.

"All the time those greasy candles would keep dropping out of the sockets I had made with the nails. But that wasn't so bad, and I didn't pay much attention to it, until the performance started. Then the grease dropping down spoiled the costumes of the performers, and all of them were ruined. I didn't attempt to show in Baton Rouge on account of it. But I always felt pleased that I showed that one night, even if the performers did lost their costumes—I was riding then, also, and mine was ruined with the rest of them—for those girls never had seen anything like it, and they really thought it was a grand illumination.

"Of course," the "Governor" continued, his recollection bestirred and alert, "there always was some fun attached to being a showman in those days. About the funniest thing I remember happened when my brother Gil tried to tie a knot in the tail of an old he-leopard shortly after this night, when we got home with the show and were putting it away for the winter.

"You know, an old he-leopard is the meanest thing that there is on the face of the earth. The one we had then was a meaner old spitfire than any one ever owned, and when it came time to shift him from his traveling cage to his stationary one in winter quarters we didn't notice that the floor of one of the cages was about a foot higher than the other one. So we opened the door—the cages were backed rear end to rear end—and the leopard went in as nice as you please.

"Then I glanced around, and as I did so I felt something brush against my legs. Pa was standing alongside of one hind wheel of the traveling cage, and I guess he must have felt it at about the same time I did. We both looked down, and there was this old he-leopard going right between us. He had gone into the cage, and then had come out through that crack where the levels of the two cages weren't the same.

"Right there a stampede started. In the front of the building was an old show case that we used to keep dried curiosities in. It had a fine glass top. Pa wriggled inside of the case like a snake. But he was so tall that he couldn't get his feet in it, and when he found that they were outside he started to yell like an Indian.

"I got up on top of the show case, and ran over the glass top two or three times. But it didn't break with my weight for a wonder, though I had on a pair of heavy boots.

"The leopard went back alongside the traveling cage, and into a horse stall, and up under a manger. He stayed there, snarling and snapping, while we got a lot of plank and laid them down over the top of the stall, and then boarded up the back. That made a big box for the cat. The first thing to do, you know, was to keep him from getting away, and then we could have time to scheme some way to get him back into the cage again.

"Well, the boards didn't come together at the end of the stall, and left cracks, probably three or four inches wide. Some way the leopard got his tail out through a crack, and Gil was so excited that he grabbed it. Then he thought he was in for it.

"He commenced to pull at that leopard's tail like a maniac, and what for nobody knew, and they never did know. Of course, the harder he pulled the more the leopard struggled, and the worse it hurt him, and the worse things looked to Gil. The leopard was safe enough, but we couldn't get Gil to understand it.

"Then the leopard started to bite into these planks we had put up—they were only inch boards, and not a very good grade—and every time that the leopard would bite he would take off a splinter as big as the palm of your hand. It was only a matter of a minute or two until he was going to have a hole in front of him big enough to crawl through.

"Well, Gil sat there on the floor with his feet braced against the planks, pulling on that leopard's tail like he was going to pull it off before he stopped. All the time he was yelling for somebody to get a rope or to do something, and the leopard was yowling and spitting like it was possessed of a dozen devils.

"The whole thing finally got to be so funny that everybody got to laughing so they couldn't do a thing, and when Gil saw that the leopard was about to eat his way through the plank he got wilder and wilder, and commenced to pull on the animal's tail harder than ever, and to abuse us scandalously. That made us laugh harder than ever. Then Gil got desperate, and began to twist the leopard's tail. That made it screech and spit all the more, and Gil yelled like a pirate.

"'Here, Gil,' pa yelled at him as soon as he felt that it was safe to crawl out of the show case, 'what in the world are you trying to do to that old he-cat?'

"'I'm going to tie a knot in its tail, so it can't pull it through this hole and get away,' Gil screamed, 'and then I'll get out and get a rope for myself.

"'You fools would stand there all day and laugh,' he went on, 'and let this leopard get away and kill somebody before you'd stir yourselves to do anything.'

"But the leopard pulled so hard, and there was so much bone in its tail, that Gil couldn't make a knot. Finally, things got too serious. I grabbed Gil and got him to let go of the leopard's tail. The cat was mighty glad to get loose, and went back under the manger. Gil got up off the floor as white as a sheet, and shaking like a leaf. He sat down in a corner while we got another shifting cage, put some meat in it, and pulled away a few planks. The animal walked into the cage after a while and we had no more trouble with him."

Upper—"Governor" John F. Robinson, "cutting up old circus money."

The Time Has Come

By LEWIS ALLEN BROWNE

We can protect ourselves from our enemies but heaven preserve us from the blunders of our well-meaning friends.

The beggar is poor, the profligate is poorer, the borrower is poorest.

There is an awful lot of talk about common sense, when we consider how rare it really is.

Woman spends a third of her time fussing about her clothes, and man spends two-thirds of his time earning what they cost.

The quickest way to get there is to pay as you go.

A lazy man isn't worth as much as an Egyptian mummy, for the mummy, while useless, is at least interesting.

Flattery containing less than one-half of one per cent of truth will intoxicate.

Women should remember that there are no paradise feathers on peacocks.

The man who always watches the clock never sees the bands point to the hour of success.

Necessity never violates the law when it is coupled with industry.

A Strange Chapter in British Colonial History

By W. P. CROZIER

Manchester, England, February—(By Mail).

IN 1889 the British South Africa Company received from the British Government a charter to trade in and administer Southern Rhodesia and it has since been known as the Chartered Company. Since 1889 it has exploited, developed and administered the country with little return, it may be said, to its shareholders and it has recently been decided that if and when the charter is brought to an end the British Government must secure repayment to the company of about four and a half millions sterling. This is a remarkable chapter in British colonial history and it throws a flood of light on the way in which commerce and politics are inextricably mixed up in the development of new territories under an imperial power.

In 1889 Southern Rhodesia was largely occupied by the Mashona and Matabele tribes. The king of the Matabele at this time was Lobengula. He and his headmen, anxious to obtain money and arms, gave very large concessions in land to various prospectors. Some say that threats and bribery played their part in the obtaining of some of the concessions. To one of the prospectors, a German called Lippert, Lobengula gave a concession which afterward passed into the hands of the Chartered Company, which was then controlled by Cecil Rhodes and Dr. Jameson. The company maintained that this concession handed over to them the ownership and disposal of the whole of the extensive territories occupied by the Matabele tribe. It would be an amazing thing if any king, however ignorant or bribable, should thus bargain away the whole of his possessions to a foreigner, and if it were true that Lobengula really agreed to any proposition of the kind the probability is that, being entirely ignorant of the legal forms of the white man, he was unaware of the significance of what he did. This is indeed the view which long afterward was taken by the highest court in the British Empire.

Before, however, the Chartered Company had asserted this astonishing claim it had actually seized the country. In 1893 occurred the Matabele war. The company conquered the Matabele, seized their territory, and have administered it ever since. It was the contention of the company that their servants were attacked without provocation by the Matabele. It is now, however, known that the Matabele were not the aggressors and also that some time before the war broke out Dr. Jameson had made an agreement with his little army of invasion under which he promised them rewards amounting in potential value to about five million pounds.

This was not the only native war fought by the Chartered Company. In 1896 came the Jameson Raid into the Transvaal. The Mashona tribe took advantage of the disturbance to rise in revolt. There was, as it happened, a clause in the charter under which the company was bound to maintain their police within the borders of Rhodesia for purposes of defense. Rhodes and Jameson, however, withdrew the police in order that they might take part in the famous raid and the Mashona, who had grievances of many kinds, promptly took advantage of their absence. The rising was crushed and the company resumed its sway. The point of these two wars, as will appear shortly, is that although they are traceable to the policy of the company, the company has claimed that the home government should compensate it for the large expenditure incurred.

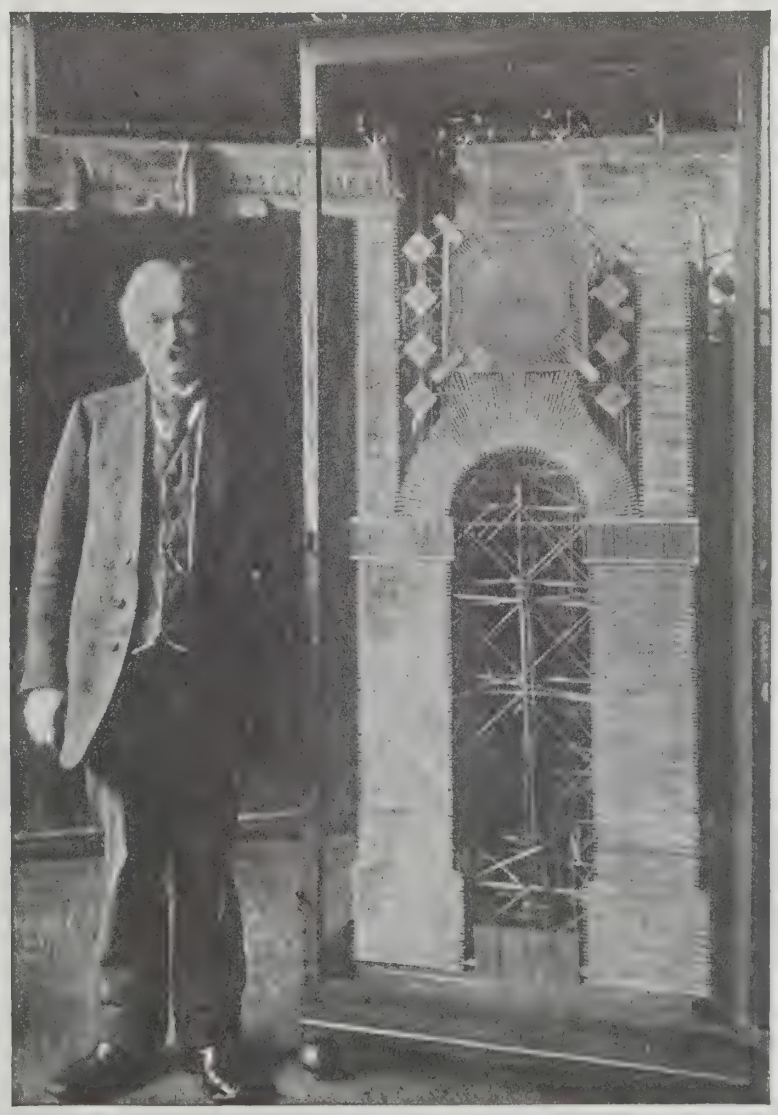
After the Mashona War the company went on with its administration until 1914. Then the twenty-five years for which the charter had been granted expired. Meanwhile the white settlers in Southern Rhodesia began to be dissatisfied with company rule. (There are, by the way, about twenty-five thousand of them, against seven hundred and fifty thousand natives.) The white men began to demand that the company's charter should be ended and that they should be given the powers of self-government or, roughly, be put on a level with the various British Dominions. But clearly if the company were, as it claims, the owner of some seventy-three million acres of land and if its charter were to be taken away the question immediately arose who would govern this land under responsible government, who would compensate the company for the expenditure which it had incurred, and to what would the compensation amount. In 1914, therefore, when the charter was renewed, a clause was inserted by which the British Government could determine it and hand over the work of administration to the people of Rhodesia when it was satisfied that they could fitly undertake it. But at the same time the government referred to the supreme law court of the British Empire, which is called the Judicial Committee of the Privy Council, the question of the ownership of the many million acres of Southern Rhodesia land. This territory, it should be added, is always known as the "unalienated" land, by which is meant any and every piece of land that has not been leased or sold to white settlers. It includes, therefore, all the lands occupied by the native tribes, and for the natives the question meant a vital decision as to what authority would in the future have the title to administer their territories.

From 1914 to 1918 the collection of evidence by the various parties went busily on. The British Government, the white settlers and the natives all opposed the claims of the company. The company contended that for two reasons the whole of the "unalienated" land was theirs. Their counsel said in the first place that as the company had conquered the country they were the owners of it. The court rejected this plea. It declared that throughout British history whenever there had been a case of conquest of any new territory, only the British Crown could enter into possession of the ownership and the sovereignty. In the legal sense no British subject can found ownership on any private conquest of his own. The company, however, put forward a second argument. It maintained that Herr Lippert had by the concession granted to him obtained the ownership of the whole of Lobengula's lands. The court took the view that this was absolutely incredible and that no person in his senses or with knowledge of what he was doing could have perpetrated such an act as was ascribed to Lobengula. The words of the court were:

"It would follow that Herr Lippert was, or could become at pleasure, owner of the entire kingdom—for nothing is reserved in favor of the inhabitants. Thenceforward the entire tribe were sojourners on sufferance where they had ranged in arms, dependent on the good nature of this stranger from Johannesburg even for gardens in which to grow their mealies, and pastures on which to graze their cattle. The Lippert concession may have some value as helping to explain how and why the Crown came to confer the administration of Southern Rhodesia upon the company, but *as a title deed to the unalienated lands it is valueless.*"

The court, therefore, found that the Crown and not the company owned the "unalienated" lands, but it found also that the company was entitled to look to the Crown to reimburse to it the "necessary and proper" expenditure which it had incurred in the administration of Southern Rhodesia. Next came the elections to the legislative council in Southern Rhodesia. The Chartered Company was completely defeated. The white settlers would have neither company rule nor absorption in the South African Union nor Crown Colony government. They insisted by an immense majority that they must have responsible government. When they put this demand to the colonial office, Lord Milner replied that nothing could be decided until it was known how much had to be paid to the Chartered Company and who would actually have to do the paying.

Meanwhile, a commission was at work investigating the amount which was due to be paid to the company. This was the Cave Commission (called after Lord Cave, its president), which has just now reported. There were many difficulties in its way. The company's accounts were partly commercial and partly administrative and the two sides were very hard to disentangle. Thus the company as an administrative organ had assigned lands to itself as a commercial concern, and the value of these has now to be ascertained and deducted from whatever amount is due to the company. The company's claims originally were very high. One of its spokesmen, addressing the shareholders, put them at £10,000,000, and in addition a claim was made for interest. Had the whole of the company's original claim been allowed plus interest, it is estimated that the British Crown would have been saddled with responsibility for £18,000,000—not much in comparison with the cost of the Great War but an annoying addition to the financial burdens which are already breaking both our backs and our hearts.



When the company came to make its final statement to the commission, it claimed nearly £8,000,000 and this, be it noted, included a sum for the 1893 war against the Matabele and a much larger amount—between two and three millions—for the suppression of the Mashona revolt in 1896. The commission now pronounces that the sum due to the company is about £4,500,000. Happily it has disallowed most, if not all, of the unwarrantable claims made for the Matabele and Mashona wars, and it has refused interest, on what grounds is not stated. The view of the company is that these sums were expended by it on behalf of the Crown. Had it not expended them, it would have employed them profitably or distributed them among its shareholders and the claim for interest seems, therefore, logically reasonable. The commission presumably takes the view that no profits at all ought to be made, or ought to have been made, out of the task of governing a country inhabited mainly by native tribes. The administration, whether that of a chartered company or of a great power, ought to be a trusteeship for the natives and should not be carried on for profit, and the commission no doubt thinks that if the shareholders of the company now obtain some millions of profit, they do uncommonly well without the addition of interest. Whether that is the view of the commission or not, it is unquestionably the right view. Neither the Chartered Company nor England nor any other country similarly placed has the slightest moral right to take a country from its native owners and administer it for private profit. That is, indeed, a decisive reason against the whole system of government by chartered company in native territories, and we profoundly hope that we have seen the last of it in British colonial policy.

But who is to pay these millions to the Chartered Company? Whose pocket is to suffer? Morally the white people of Rhodesia ought to bear the principal burden. The administration has been mainly for their benefit. The Crown has now to pay for roads made by the company and for government buildings erected by it. All such things were created chiefly for the use of the whites and will profit them more than anyone else. Similarly the natives might be called on for small contributions. The British taxpayers, as the overlord for whom the company acted, should pay something too.

This question of who pays is not a small matter. The Judicial Committee in 1918 suggested that a compensation fund should be created out of the sale of the "unalienated" lands—the sale, that is, of lands now held by the natives. But it would be the last word in injustice that after the company had seized the natives' country as a whole, the Crown should now proceed to sell their lands to white men to reward the very people who made the war and seized the country.

That surely cannot be done. The British Parliament has yet to consider the whole case and if it does its duty it will insist that it is the trustee for the dispossessed natives and that they shall not be wronged. It may be doubtful in what proportions the burden of the four and a half millions should be distributed between the British taxpayer and the Rhodesian whites. But at least it cannot be thrown, except possibly for a very small contribution, on the original native owners of Southern Rhodesia whom we have dispossessed.

A Remarkable Clock Made Entirely of Straw Keeps Good Time

(C) Gilliams Service

A clock made entirely of unprepared straw, both in construction and mechanism, is now on exhibition in one of ex-Kaiser Wilhelm's Palaces in Berlin. It is 5 1-2 feet in height and 2 feet 4 inches in width, and after winding, keeps accurate time for five hours. The constructor, Otto Wegener, of Strassburg, worked for fifteen years before he perfected the mechanism. He is standing proudly beside his great work.

Should the Farm Woman Be Pitied or Envied?

By AARON HARDY ULM

This is the third of a series of articles by Mr. Ulm on farm life and farm management.

"THE farm woman has been the most neglected factor in the rural population." That sentence is the keynote in a letter of inquiry sent by the United States Department of Agriculture a few years ago to about 50,000 American farm women.

About 2,000 answered—mainly in kind. Besought for expressions of dissatisfaction most women who replied to the inquiry sent up wails of complaint that would bring tears from a brute. A few didn't attune their answers to the note of pity put forth in the department's letter, and those few wrote optimistically of farm life.

A short time ago a farm paper with a big circulation called its readers' attention to something somebody had said or written about the down-trodden and unhappy situation of American farm women as a class. The paper expressed disagreement with the contention and asked its readers to write and say whether it was correct. The writer has seen a stack made up of hundreds of letters written voluntarily in response to the request. Virtually all agreed with the farm paper's contention, the writers expressing a high degree of satisfaction with farm life.

When one approaches the farm woman question, the result attained depends largely upon the manner of the approach. If it is optimistic, so will be the returns, and vice versa.

A rural life specialist in the United States Department of Agriculture is planning to send out another series of departmental inquiries to farm women. Instead of approaching them on the basis of their being the "most neglected factor in the rural population" he proposes to predicate his inquiry on the basis of their being the "most important factor in the rural population." And he is going to request them to say how they are living up to their high obligations, to detail the satisfactions they get out of rural life, and to tell how pleased, and for what reasons, they are with the lives they live. He expects a response that will be as optimistic and cheery as that of a few years ago was pessimistic and gloomy.

The mistake most people make in sizing up the farm woman, and for that matter any farm problem, is in judging the different equations by city standards. Most farmers get up and begin work at daylight and don't knock off until dark during the longest days of the year but it is a mistake to visualize a farmer's work hours in the terms of a mechanic or clerk working from daylight until dark in mid-summer. It is a different proposition. Likewise the farm wife and her duties and deprivations, as compared with the city woman and her "advantages."

Only recently the United States Department of Agriculture announced the results of the most extended farm-home survey ever made in this country. It was carried out in co-operation with the agricultural colleges and the facts were collected by home economics or county extension agents directly from more than 10,000 homes in selected "typical" farming communities in all the states of the North and West. Interpreted by the more or less imaginary "city standard" much of the data secured is very depressing. It was shown, for example, that the farm woman's work day in summer averages more than 13 hours. But it is foolish to judge that in terms of a woman standing at a machine in a factory or a counter in a store for 13 hours day after day. The farm woman's work at least has variety. It was shown that her winter work day averages much less—only a little more than 10 hours. It was shown that only about 12 per cent of farm women enjoy annual vacations, which was one of the most depressing figures. But if compared with the vacations enjoyed annually by the farm women of fifty years ago it would probably show considerable advance. It was shown that about 25 per cent of farm women, in addition to housekeeping, help with live stock and in the fields—a discouraging item. But in some countries it is the universal custom for farm women to take care of the live stock. And in many countries the women help in the fields all the year, while it was shown that the American farm women who did work in the fields do so for about only seven weeks in the year. It was indicated, furthermore, that field work in the communities surveyed was confined largely to immigrant women. "I don't work in the fields because American women don't," one Italian woman wrote, for instance, on her questionnaire.

The worst showing made by the figures resulting from the survey was with reference to conveniences in the home as compared with those in the fields and the barns. They show quite clearly that the average American farmer has been more interested in getting labor-saving machinery for field or farm use than for home use. This, the students say, isn't an abnormal phenomenon, that money-earning must precede living luxuries. And the farmer has not yet quite reached the stage whereby he views many household appurtenances now regarded as necessaries in cities as being much more than luxuries. But that he is seeing their practical as well as pleasure worth is shown, after all, by the vast extent which the survey shows up-to-date household equipment has been acquired by farmers.

Running water and lighting systems and power machinery in the home as well as outside of it and bathrooms were found on from one-fifth to one-third of the farms in the North and West. There were not so many of those things on the farms as in the cities but compared with what were on the farms fifty or even twenty-five years ago the facts show immense progress.

"That marked progress has been made during the last few years in raising the rural home standards of living cannot be questioned," says Miss Florence E. Ward, in charge of the extension work with women of the North and West carried on by the Federal Department of Agriculture. "Every community boasts some homes which exemplify the fact that the country today with a reasonable amount of prosperity and good management offers all the traditional freedom and independence of rural living with most of the hardships of former days eliminated. The telephone and the automobile in large measure free the farm family of isolation. Modern machinery for farm and home eliminates the drudgery from field and kitchen. Rural engineering has mastered the problems of sanitation for the farm home. Community centers make possible wholesome and inspiriting social contacts and mediums of self-expression."

Yet, as Miss Ward and others say, there is much room for improving the conditions surrounding the average farm woman, just as there is much room for improving the conditions surrounding the average individual of almost any type or class.

And many agencies are now at work on the job of helping to make farm life more attractive to women. For, unlike most city pursuits, woman is virtually essential to successful farming. One of the chief difficulties farm economists have in arriving at statistical data regarding farm operations is due to the farm home being inseparably entwined with the farm business.

"Farming is essentially a home enterprise," says Dr. Warren, of Cornell. "It is very different from most city occupations. The success of the farm is dependent on the entire family."

The biggest work on behalf of the farm home and farm women centers in the United States Department of Agriculture and is carried on co-operatively with the states by the means of the agricultural extension service created by the Smith-Lever Act of several years ago. The home economics branch of the extension work relates directly to the farm home. It has not been advanced nearly so much as has the county agent branch of the same service. The county agents deal directly with farming operations. One or more are now employed in a majority of the farming counties. Home economics workers are not so numerous, there being fewer than 300 in all the counties of the North and West. Home economics workers and county agents constitute the connecting link between the Federal and state departments of agriculture and the state agricultural colleges. Home economics workers, as with county agents, are in no sense "uplifters." They work best in the most enterprising farm communities. Their business is to carry to the farm homes expert knowledge not easily gained by women anywhere.

Thus the home economics division of the Department of Agriculture is headed by a distinguished scientist, Dr. C. F. Langworthy, who is assisted by Miss Caroline B. Hunt, both of whom are national authorities, for example, on food values. They have made extended scientific studies of various foods with the double purpose of facilitating the efficient use of farm products and adding to health and strength of both city and country people.

The scientific branch of the department's home economics work has studied housekeeping appliances and methods with the view of showing women how to lighten their burdens and increase the efficiency of their homes. One of the studies, for instance, had to do with the different degrees of energy spent by women in performing each of the foremost tasks of housekeeping. This was done by placing a woman in a big calorimeter, which makes infinite measurements of heat, and having her sweep, or wash clothes, or iron, or sit and rest, and so on, during fixed periods of time. The instrument registered the calories of heat consumed an hour in each operation. Washing towels ate up the most strength and sweeping came next.

That sort of information guides the directors of the home economics workers in developing programs of advice based on sound principles. Those programs are shaped largely by the needs of different communities. Often a good new idea is developed in some remote community. The home economics worker learns of it and passes it along to the people in Washington, who in turn distribute it among other home economics workers and as far as they can to women generally. Right now, as a good instance, the propagandists in the home economics division of the agricultural department are giving national distribution to a new way of making a dress form. Briefly described, it comprises only a gauze undergarment stretched over the form of a woman, around and over which is wrapped several layers of gummed paper strips. When completed it is cut open in the back, taken off the form of the woman, glued back together, and the woman who makes her own clothes has a dress form that exactly duplicates her own form. It costs about $1.50. The idea is believed to have first developed in the South. The state director of home economics workers in Massachusetts heard of it and spread information about it in her state and passed it along to Washington. It is such a splendid idea that the Department of Agriculture is giving it national circulation.

The foregoing, of course, is only a brief review of some things that are being done co-operatively with farm women to improve the farm homes of the country. Co-operation is the keynote of all the work. There are now hundreds of social centers set up in farm communities for farm women who often do many things on a co-operative basis. Even the rural co-operative laundry is multiplying in up-to-date farming sections of the country.

There has been a decided awakening as to the importance of the farm woman and her domain, the farm home. In a national or even a state sense it came long after the awakening as to the importance of the farmer and the farm proper. And of course an awakening on any subject is first followed by the presentation of the worst side, for if improvements are made, the room for improvement must be located. But to find the need for and means of making improvement anywhere doesn't necessarily imply that none has been made, or that conditions are more bad than good.

"As compared with the farm women of the most favored nations of Europe, the farm women of America have much to thank God for," says a national authority on rural life. "Women's continuance in the fields of America is not unknown but is rare. With the exception of certain crop sections and certain racial spots women do not work in the fields at men's work. Freedom from men's work on the farm has been accompanied also by freedom from much heavy work of the dairy and kindred tasks. The growing release of farm women in America from the muscular tasks on the farm which belong more properly to men is a straw pointing to the ultimate emancipation of all American farm women from men's work in the country."

And, most specialists believe, farm women are as satisfied as any other class of women. Of course the average woman can't be as "successfully single," perhaps, in the country as she can be in a great city. But statistics recently announced by a student of the subject show that in the country she can be much more "sucessfully married." For the record of divorces in rural districts—being, the authority states, only one out of every 92 marriages—is veritably negligible as compared with the rate of divorces in the cities. And, though it is often stated that the rate of insanity is much higher among farm women than among city women, vital statistics show that the average life of the women in the country is about five years longer than that of her city sister.

(C) Harris & Ewing

The closet-like cage is called a "calorimeter." It is used by the Home Economics Division of the United States Department of Agriculture in studying foods and how to make best use of them—the nutritive differences between beans and steak, for example. It has also been employed in finding the amount of energy spent by the housewife in performing her household work. Yes, sweeping consumes the most.

(C) Harris & Ewing

Top, left—DR. C. F. LANGWORTHY, a distinguished scientist, who heads the Home Economics Division of the United States Department of Agriculture. He and his assistants help to apply such things as intricate chemical studies to the problems of housekeeping, especially those of the farm women. Right This is an inside view of a class in an Indiana country school. Note the lunch buckets as of yore; also the cups which contain hot cocoa prepared at the school—did you ever hear of such a thing in your country school days? The "hot school lunch" for country school children has made big progress.

Below, left A local club of country women learning better methods of packing eggs for market. Through encouraging the improvement of methods used in management and care of farm fowls and their products, many farm women have made big increases in their "pin money" income as a result of home demonstration work now carried on along national lines. Right—Customs change, even in the country. This is a view of a kitchen attached to a rural school in Massachusetts. It is used for preparing and serving something hot with lunches during the winter school season.

King Ice Rules Kamchatka 10 Months

EVER since Washington Vanderlip announced his discovery and acquisition by lease of a Siberian El Dorado, the Japanese press has been much exercised to discover the truth of the treasure-house they had overlooked, and of which Mr. Vanderlip has said: "There will be cargo enough to be carried to America to keep the idle fleet of the Shipping Board busy for the next 40 years. The fisheries are twice as great as the Alaskan salmon industry. There is enough oil to meet the entire demand of Canada. There is enough grain to supply all Siberia."

Some of the newspapers and some other interested parties have sent experts to investigate the matter; and the observations and conclusions of these experts are summarized here.

The two original authorities on the region are George Kennan and a Russian named Shklovsky. Kennan was a member of the party who explored the region in 1864 for the telegraph line. Shklovsky was exiled for years in the western part of the territory and had ample time to make observations, which he incorporated in a written description when he returned to civilization.

These two men agree on one point: That Kamchatka is ruled by a monarch far more potent than the Mikado of Japan or the Amir of Afghanistan. King Ice rules the land ten months in the year. As far south as Petropavlovsk the average temperature in July is 58 and in January 17. The mean temperature in this region is 26. But as you travel north, it becomes rapidly cooler, with a mean temperature for the year of four degrees by the time you are out of the peninsula.

After that you reach the main territory and it begins to get cold. The first important town west of the 160th meridian is Verkhoyansk, where the average temperature from December to February is 53.1 below. The rivers are free from ice only from the end of June until early in September. They say it is very beautiful in the summer. It lasts two months. There is no spring and no autumn.

It is a poor timber country for several reasons. For one thing, the short summer does not favor the growth of timber-bearing trees. The ground never thaws more than ten inches below the surface in summer. Below that it is perpetually frozen for 700 feet. The trees, therefore, are unable to send down roots and the winter winds drag them out of the ground.

The investigators assert that in lower Kamchatka some few vegetables are grown, but that cereals are impracticable even there, and ask where Mr. Vanderlip is going to grow his grain to "supply all Siberia."

The Bolshevik foreign minister, Tchitcherin, is responsible for the statement that "vast oil strata and bituminous coal deposits have been discovered in this country," and undoubtedly there are minerals in the territory, including coal, copper, mercury, iron, mica, sulphur, graphite and amber, and perhaps some gold.

This has been known for years, but no one has been found until today ready to contemplate extracting it.

At present the entire economic endeavor of northeastern Siberia is directed to the pursuit of fur-bearing animals and fishing. Sable, fox, lynx and squirrel are much sought after; also bear. Deer, big-horned elk, hares and field mice supply the natives with clothing and food. In the brief summer the marshes swarm with wild fowl. But one other member of the animal kingdom attracts more attention from the visitor than anything else, and Mr. Shklovsky has left the following record of it:

"This marsh pest, the mosquito, gave us no rest during the whole of our journey. The white cruppers of our horses were black with the insects which settled on them and above us the mosquitoes hung like a black cloud. At first our horses plunged, reared and rolled on the ground, trying to get rid of the tortures, but, finding all attempts useless, they resigned themselves to fate. The drooping heads and mournful eyes of the poor animals expressed the depths of despair. Nets, gloves and thick coats formed only a temporary protection from the mosquitoes. At each halting place we made a huge smoke fire, near which our horses remained all the time; but even this did not help much, for if for one moment the wind swayed the column of thick white smoke, whose acrid fumes choked us and burned our throats, instantly the mosquitoes settled upon us."

The population consists of 40,000 persons, all but a few hundred being natives, among the most backward peoples in the world. The biggest town, Petropavlovsk, is 1,500 miles from Vladivostok by steamer, is an important fur center, and possesses the better element of the population. The only sizeable town in the lease territory is Anadyrsk, which has less than 300 inhabitants who spend most of their lives, houses and all, buried under the snow.

Native tribes of Chooktchi and Koriaks are scattered over the country, in small settlements on the banks of the river. They wash the face only for the wedding ceremony, and the price of a girl is a block of tea and a cup of vodka. A reindeer costs more.

Their clothing is of skin, and their tools of wood, bone and stone, thus approaching as near prehistoric man as can be. They live almost wholly on fish, and as the catch rarely lasts through the winter, they fight starvation by feeding on the refuse and even old shoes and leggings. As the natives do not understand how to preserve fish by smoking it, and have little salt, half decayed fish is the principal dish. Smallpox is rife among them.

There is a better class of Koriak who leads a nomadic life; these are the reindeer barons, a group or clan owning frequently a herd of 600 deer. They wander across the tundra, of which Kennan wrote:

"It did not seem possible that human beings could live, or would care to live, on this desolate plain of moss, 4,000 feet above the sea, enveloped half the time in drifting clouds, and swept by frequent storms of rain and snow."

And Shklovsky, returning to civilization, exclaimed: "Miserable country, miserable nature, miserable people!"

Mr. Vanderlip's El Dorado does not include Petropavlovsk, but seems to be only an eastern strip of icebound region, inhabited by these extremely poor savages. On the question of exclusive rights to the fisheries, the Japanese say much, in view of the Fisheries Convention between Russia and Japan which followed the Peace of Portsmouth. By this, Japanese shared the rights and privileges of the Russians in the latter's Asiatic waters. The various fishing-grounds are divided off into "lots" and each lot is put up at auction for lease for the year to the highest bidder. There are 27 Japanese canneries in the district, of which four appear to be within the supposed bounds of the Vanderlip concession.

Apart from the fishing privileges, Mr. Vanderlip need expect no international trouble over the "exclusive" rights to mineral resources. All he has to do is to get 'em out.

Turning Out Money in Uncle Sam's Factory

By ROBERT KENTON

PEOPLE who work in a certain factory in Washington, D. C., might rhyme the old line this way: "Money, money everywhere but not a cent to spend."

During the fiscal year ending June 30 last that factory turned out products of a face value of nearly twenty-eight billions of dollars; during the previous fiscal year the face value of its output was almost fifty billions of dollars. No other factory in the world does such a business.

The factory in question is known as the United States Bureau of Engraving and Printing which makes all our paper money, postage stamps, revenue stamps and national government securities. So great has been the demand for its products that during the last few years the factory has been operating every day and every night, six days a week, with three shifts of workers. When its present building was erected only a few years ago, the facilities were shaped with the view of being sufficient for twenty-five or thirty years. In addition to treble shifts, working space outside of the main plant has been taken. Though we haven't worked our money-making printing presses with the recklessness of many other countries, we have during the last year turned out more money than during any other like period in our history—and more than anyone ever thought would be turned out in such a period of time. This was due, in the main, to the war whose demands added greatly to the novelty of the most novel and fascinating printing establishment in America.

About 125,000 sightseers now visit the United States Bureau of Engraving and Printing in Washington every year. And the chief surprise to each of them is that there are very few secrets about how paper money is made. In fact, excepting the process for making the white paper on which money and government bonds are printed, there are no secrets about the work. Another surprise is in the apparent freedom permitted everyone employed in making money. Though money passes through their hands in great bundles and with as little seeming formality as the rushing of collars from worker to worker in a laundry, the thousands of workers go and come and mingle together with as little restriction, apparently, as employes of any other factory. It would seem possible for one to stick bills representing millions of dollars into an inside coat pocket or effectively conceal them elsewhere in the clothing and get away with it; for there is no searching of persons or garments. It is entirely possible for what is stated to be done by any one of several thousand employes—excepting the part of getting away with it. Many attempts have been made, but veritably all, say the officials, resulted in discovery and usually were followed by terms in prison.

For with all the apparent absence of restriction on persons who help turn out bales and bales of manufactured paper money and other securities every day, there governs work in the Bureau of Engraving and Printing certain soft and subtle precautions that make successful stealing all but impossible.

The precautionary system has been developed through the years and is the product of great experience and knowledge of human nature. It is hard to grasp and describe the system which in some respects is more psychological than mechanical. It is predicted perhaps on the notion, whose truth the records of the bureau bear out, that the great bulk of people are by nature honest. Another fundamental is that people often need to be protected from themselves. Hence one of the strongest factors in that system is collective responsibility. Another is the rule that no person be permitted to do important work alone or separated from others.

Most of the work, such as counting and assorting and bundling, is done by groups. Each group receipts to the last one that handled the "goods" it works on and takes a receipt when the work is passed on to another group. If when so passing, something disappears and individual liability cannot be fixed, every one in the group of workers is held to be responsible and has to pay. If a sheet of ten dollar-bills only half printed disappears in transit through the bureau, the group in which the loss occurred is easily discovered. Then the person who caused the loss is sought. If it is a proved case of theft, jail doors open immediately and penitentiary doors open ultimately. If it is due to carelessness the person is fined, suspended or discharged. If the sheet is not recovered the person, if found, who lost it must pay for its full face value; if individual blame cannot be fixed then the group in the section where the loss took place must share the indemnity.

The collective liability rule makes every worker watch associates, for a careless or dishonest one might cause an honest one to be called on to help make good a big loss.

The rule that no person shall handle money alone is aimed at protecting everyone from himself or herself during those possible weak moments when temptation presses. No one can go alone into a vault where there are valuables, and the rule applies to the high officials as well as to the lowest workers of the bureau. If a stack of bills must be carried from one part of the establishment to another, two or more persons must go along with it. Checking up is a very important part of the work. This requires the employment of hundreds of counters; for from the time bundles of paper are turned over to the bureau exact accounting must be made of every sheet until it is turned back in printed form to the Treasury or other governmental department.

The paper is made at a factory in Massachusetts. No visitors can go through the paper mill, which is run by an outside agency on contract with the government. There is no secret about the composition of the paper. That for money and bonds is made chiefly of linen, though scarcity of material forced them to use cotton almost entirely during the war and for a while afterward. The secret is in the little silk threads imbedded in the paper and the way they are put in. If I knew how it is done it would not be lawful for me to describe the process here. No outsider can legally manufacture paper of that kind by any process or for any purpose, even though it have nothing to do with counterfeiting.

A sheet of money paper is handled about fifteen times, after it is turned over to the engraving bureau, before it is returned to the Treasury as a sheet of bills. The backs are printed on power presses but the "faces" are done on old-time handlike presses. The printing process is what is known as "intaglio," and about the only improvement made in it for many years is the equipment of the small presses with motors. Until a few years ago muscle power turned them.

The making of plates is the most intricate as well as the most interesting of the bureau's work. The leading steel engraver living is among the engraving force of the bureau. He receives a salary of $7,500 a year which is $1,500 more than the director of the establishment gets. Some of his portraits for bills are world-famous as works of art.

The engraver cuts out the main designs for bills or securities on soft steel. Formal work is done by a machine, a big diamond-pointed lathe, which can be set so that it will work out automatically such as the formal decorative work around the edges of bills. This machine work is very important, for it cannot be duplicated by hand, and many of the lines are so delicate that they can't be picked up and transferred by the photographic process. Hence without a machine of that kind, which costs a great deal of money, no counterfeiter can make a plate that will exactly duplicate paper money or bonds.

From the original plate a "die" is cut, which can be used to cut working plates for the presses.

All plates are preserved with a care exceeding that given to any other thing around the bureau. For with a set of those plates, almost anyone might turn counterfeiter and be able to produce perfect counterfeits. The plates are kept in a great vault, in the basement of the bureau building. The keeper of the vault is never allowed to leave it when the door is unlocked, and it is so surrounded with lights and reflectors that he can stand at the door and see above and all around it without moving.

Postage and revenue stamps are turned out chiefly by printing processes that are not unusual. Big power presses are now used for that work. The present director and his force of mechanics developed a big rotary press that reels off stamps very much like a newspaper press pours out newspapers. It even does the gumming. Tons and tons of gum are consumed by the bureau every year. The gum used on stamps is virtually the same substance as that used in making tapioca. It comes from a tuberous plant called cassava and grown chiefly in the East Indies.

Many revenue stamps are now printed by what is known as the off-set process which is something like lithography, of which a little is done by the bureau.

In addition to money and bonds, the engraving bureau prints many other things like check books, blank commissions, and other government forms that require plates. It even prints the President's cards. But it is not open to work for Congressmen and other government people around Washington as in the case of the Government Printing Office.

The amount of money printed every year is staggering. Currency, bonds, notes and certificates of indebtedness turned out during the last fiscal year had a face value of nearly $26,000,000,000. Bills each with a face value of $10,000 are the highest denominations of currency turned out. Certificates of indebtedness often have individual face value of $100,000.

It takes more than $7,000,000 a year to pay the operating expenses of the Bureau of Engraving and Printing. Some of that comes directly from outside agencies that have to pay for work done, such as the Federal Reserve and national banks. The rest is an "overhead" charge, chiefly on money and bond manufacture. But it isn't a tax in the strict sense, for all the government's expense in producing paper money and bonds is more than made up for by the securities that go out and never come back for redemption. It is estimated that one per cent of all national bank currency is never redeemed. But it doesn't accrue to the banks, even when they go out of business; but goes into the United States Treasury, where the fund held for the redemption of bank currency alone amounts to about $40,000,000. Most of it will never be drawn, for the money represented, no doubt, in the main has been destroyed or lost beyond recovery. Yet every now and then somebody comes along with an old bill or other government obligation that should have been redeemed a long time ago. A few days before this was written an Illinois woman showed up with a $1,000 certificate issued in 1853 to indemnify Texas for Mexican war claims. The engraving bureau pronounced it genuine and it was paid.

Of the more than 7,000 employes, over 4,500 are women, and most of the women are rated as unskilled help and are not highly paid, especially as compared with skilled help.

"But in 25 years' experience here," said an old attaché of the bureau, "I have known only one woman to be caught in trying to get away with products of the bureau. She took out a sheet of nearly completed bills. We knew of it within a few hours and recovered the sheet next day. All other peculations were by men. Before the war they were not numerous; I can recall only three. But during the war when there was a great labor turn-over and some confusion, there were several attempts made to get away with money or other things of value."

The only perfect counterfeiting that has ever been done in this country was by an engraver who worked in the bureau. He duplicated at home some of the plates he made in the bureau, and the bad money put out brought on a court fight that went to the United States Supreme Court, which held that, no matter by whom or how made, illegal money is worthless and cannot be redeemed by the government. That is the last case, say they, of a bureau engraver going wrong, and it happened not long after the Civil War.

There is an interesting story about the portraits of Presidents and others that are put on bills and bonds. The subjects are chosen by the Secretary of the Treasury, who is limited only to the likenesses of people who are dead. This lone restriction was put into the law because, not long after the bureau was established, a bureau director put his own facial likeness on a series of greenbacks. While the figures of Presidents and Secretaries of the Treasury are ordinarily used, generals, Senators and others have been so honored in the past. Excepting the fanciful figure of "Liberty" no woman's likeness has ever been used, although there is no law preventing the honoring of any woman, provided she no longer lives.

Interior of one of the numerous storage vaults in the Bureau of Engraving and Printing. The face value of the contents of the packages seen is in tens of millions of dollars.

Glimpses of Our Money-Making Plant

Above, left—Printing Division, motor driven hand plate printing press section. Above, right—In the vault where postage stamps are kept. Below, left—A box of finished money leaving the Bureau of Engraving and Printing. Below, right—Entrance to the "holy of holies" vault in the Bureau of Engraving and Printing. Here are kept when not in use all the dies, rolls and plates used in making money and other Government securities. The outside of the vault is so mirrored that one may stand at the doorway and look over, under and completely around it.

Agriculture—Manufacture—Transportation

The Oregon legislature has appropriated $40,000 for the study of fruit in ocean transit. It is the opinion of the Oregon Growers' Co-operative Association that the study of conditions of western boxed fruit in ocean transit is of especial importance to Oregon.

Areas formerly infested with cattle fever ticks were released from Federal quarantine last year by the United States Department of Agriculture. Regions of the South now removed from the quarantine are now raising and marketing excellent cattle.

According to the Society of Automotive Engineers a concrete slab road, about eight inches thick and of a uniform depth across the road, perhaps with an increased thickness integral supporting curb-block on the edges in some locations is the type of road that should be built in the United States.

In English factories ropes superseded belting years ago and today their use is almost universal. For some time the factories of the United States have been increasing the use of fibrous material in belting. It is said to possess the advantage of noiselessness owing to the existence of an air passage in the grooves between the sheath and the rope.

The farmers of the United States each year use approximately 7,000,000 tons of commercial fertilizer.

Thirty-six railroads failed to earn their operating expenses and 28 did not earn their taxes during the month of January, 1921.

Representative Steenerson, of Minnesota, has introduced a bill providing for the regulation of grain exchanges, making them open to membership of all organizations and persons. This will open the exchanges to farmers' co-operative grain associations.

An index to the accuracy of the estimates made by the Bureau of Crop Estimates, United States Department of Agriculture, is shown by a comparison with the estimates on cotton yields made by the bureau in December with the annual report of bales ginned issued by the Bureau of Census the following March. The deviation of the estimates from the census during a period of 20 years was 2.5 per cent.

Good roads advocates of Alabama are putting across a 12-year $50,000,000 building program, using as their slogan, "The heaviest tax the farmer pays is the mud tax."

It is stated that a new record run between New York and Rio Janeiro has been established by the steamer Huron of the Munson Line. The vessel arrived at the Brazilian port in 13 days and 22 hours.

So many inquiries have been received that Washington has notified postmasters that postage, inclusive of insurance fees and postage war tax, may be allowed, when claimed, on account of the outright loss of insured parcels.

Ninety-seven thousand Michigan farmers have joined the State Farm Bureau. Delegates from all but seven of the state's counties attended the second annual meeting held recently.

In order to relieve the congested state of the wool market, which is causing a great deal of unemployment, British interests are forming what will be known as the British Woolen Trades Export Corporation. The corporation will co-operate with the government and will work in conjunction with produce and raw material concerns to extend credit facilities and to effect an increase in the interchange of manufactured goods.

The Southern Railway recently declined to join other railroads in making contracts with the American Railway Express Company.

A new department, known as a statistical section, has been formed in the Bureau of Markets. It will attempt to meet the need for accurate and complete figures in the working out of marketing problems.

Freight rates on sugar from Cuba have been reduced approximately 50 per cent.

The Mexican Department of Agriculture is encouraging the development of irrigation throughout Mexico, aiding in the installation of hydraulic machinery and in the drilling of artesian wells. Fish hatcheries are also being built in Monterey, Zacatecas, Durango, Aguascalientes and Lower California.

It is estimated the world wheat surplus is 170,000,000 bushels.

Argentina has approximately 20,370 miles of railways radiating fan-like from Buenos Aires for the most part. Britons own and operate more than three-fourths of the systems.

Briefly Told

Fur seal hunting in the summertime off the coast of Washington is restricted to the Quillayute, Ozette and Makah tribes of Indians, whose rights are guaranteed by a treaty signed ten years ago by the United States, Great Britain, Russia and Japan.

A new metallic packing has been invented, the component elements of which are mica and babbitt metal.

The Forest Service of the United States Department of Agriculture has about twenty male buffaloes of varying age and size which it desires to give away or lend to zoological or park associations. Responsible individuals may also take advantage of this offer provided they take good care of them and use them for exhibition purposes and breeding.

The Japanese women pearl fishers commence their work at the age of fourteen. Almost all the year around they are in the water, except in the coldest season.

An air-driven motor sled for use on the ice has been perfected. The power plant consists of a two-cylinder motorcycle engine driving a geared-down propeller. Sixty miles an hour was attained by this novel craft in a recent test. While air-driven boats are no longer a novelty this is the first known instance where an air propeller was used for propulsion over ice.

A novel warning sign has been erected at a railroad crossing in San Antonio consisting of a platform eight feet above the ground, upon which is placed a wrecked automobile which figured in a fatal accident of that road some time ago and which resulted in the death of two occupants of the car. A sign under the platform bears the words, "Did the Driver of This Stop, Look, Listen?"

A dense, yellow, penetrating fog hung over the city of London recently so thick that some of the busses gave up in despair and stopped in the streets until it had cleared sufficiently for them to find their way.

A German coffee company is selling coffee from which the caffein has been extracted. It is claimed that the coffee so treated is superior in quality to the bean in its natural state.

A peculiar custom of the Hindoos during their Huli festival consists in the sending of persons away with messages to dead individuals, or persons known to be from home, and enjoying the laugh at their disappointment.

Geologists are investigating the feasibility of manufacturing steel and iron in the state of Washington.

As a result of the bursting of a high pressure water main in Montreal recently, two boys were drowned, several families were rendered homeless and twenty-eight persons were taken to the hospital.

Experiments in Turkestan to extract edible oil from a wild plant called "kumtary" have proved successful. The residue is made into oil cake which is very nutritious.

Among the many peculiar trees of Australia are found the flame-trees rising to nearly one hundred feet; the fire-trees, the only tree that blossoms scarlet red, resembling a tree on fire; beef-woods, leafless trees with drooping, rigid branchlets of the color of beef and the Indian figs, a wonderful, lofty tree of graceful form and brilliant color.

Our government is sending to Australia certain insects that prey upon the prickly pear cactus which has become a first-class nuisance in that country.

A new broom addressed to "President Warren G. Harding" and with the words, "Use it!" written on the reverse side of the address tag was recently delivered at the White House by express.

Arab women churn butter by suspending a large sheepskin receptacle full of cream from a tripod, then jerking the bag to and fro.

In certain sections of the Northwest farmers make their own refrigerators by digging a well about twenty-five feet deep, putting rough stones on the bottom for drainage and filling the well with snow. Water is poured on the snow making a pillar of solid ice, some of which remains all summer. Ladders built against the side of the pit facilitate entrance to the ice as it melts away toward the bottom.

A blue-winged teal was killed near Port of Spain, Trinidad, upon whose leg was found an aluminum leg-band showing the duck had been trapped at Lake Scugog, Ontario, last autumn. This practice of banding birds furnishes conservationists with much valuable information.

When gates of the Balboa dock were opened recently to admit a vessel, a school of fish swam in. The commissary got several hundred pounds of fresh fish and the laborers all they could carry. The rest were shoveled overside, most of them recovering and swimming away.

The Director of Sales for Treasury savings securities calls the attention of the general public to the fact that many persons have thrift stamps lying about their offices and homes without realizing that they may turn them into interest paying securities. They were purchased during the excitement of the war and in many cases given to children who misplaced them.

To break up old stone walls or other masonry, drill a good-sized hole in the wall—making it bottle-shaped with as small an opening as possible. Place quicklime in the hole to within a few inches of the top and make a tight-fitting wooden plug to drive in the opening. Quickly pour in enough water to slake the lime and drive home the plug. The action is similar to that of a small portion of dynamite.

The school attendance of the Philippines is growing so rapidly that there is a constant demand for more American teachers. The principal demand just now is for fully qualified teachers to teach high school classes.

The only university in the United States to offer a course in fisheries is the University of Washington.

The leader of a band of wolves whose depredations have caused thousands of dollars' loss to stockmen of Colorado will be used as a decoy in an effort to trap other wolves of his band.

An ostrich's egg has sufficed for an omelet for thirty persons. The ostrich egg has less protein and more fat than meat, and its useful constituents include iron and phosphorus. The flavor and food value are about equal to those of the domestic hen.

March 9 has been designated as national fish day throughout the United States by a nation-wide organization of fishermen, following a custom which has prevailed in other countries for many years. National fish day dinners will be held in many cities all over the country.

Indian women of the Penobscot tribe recently started on the warpath to obtain the right to vote in tribal elections and share in the conduct of affairs pertaining to the reservation. The attorney-general of Maine stated he would not interfere but would remain neutral.

Travelers state that fifteen years ago the principal objects of interest along the beaten track of the old Sante Fe trail were skulls, vertebrae, and ribs of cattle and buffaloes. Now a traveler traversing the same country finds numerous abandoned automobiles, some overturned, some buried, others smashed and looted.

An Illinois farmer found a pearl between the toes of a hog recently. The gem was sold for eight hundred dollars to a local jeweler. The unusual find is explained by the fact that the farmer had been feeding his swine mussel meat, which he had obtained from clam diggers.

In the naval hospital at Balboa Park, California, is the youngest sailor in the United States Navy. He is thirteen years of age and was assigned to the U. S. S. Mercy, a hospital ship, after he had received training at Mare Island.

The only woman to go over Niagara Falls and live, today is in the Niagara County infirmary practically blind and without friends. She is nearly seventy-five years of age.

A purse of gold was recently presented to a landlord in Lynn, Massachusetts, by his tenants who said he had a heart of gold. Although owners all about him had increased their rents this landlord had not increased his prices in the last five years.

The city council of Macon, Georgia, has passed an anti-flirting ordinance, making it unlawful for men to converse with or make signs at girls.

A soda fountain located in the basement of the Earlington Building, New York City, where prohibition officers have their headquarters, has been forced to go out of business because of the lack of patronage.

A Simple Question -- Bread or Guns?

PRESIDENT HARDING speaks of "approximate disarmament." Whatever this may mean—and it is open to many interpretations—it signifies a step in the right direction. Disarmament in any degree is hopeful and necessary. The main point is to emphasize the idea of disarmament as the single act by which more burdens can be lifted from the people than by any other within the power of governments to perform.

"Approximate disarmament," of course, means approximate armament, and there is a question how far the world should maintain instruments by which to enforce the peaceable decrees of civilization. The world is not civilized as yet; the war idea is not dead; even among the small nations, the primitive idea of the battle-duel still holds sway in backward portions of the earth; and situations are conceivable wherein even peace may have to be enforced by a show of power.

But this is not the kind of armament which has aided the wreck of the world and which consumes even here in the United States 92 per cent of the national income to maintain. To provide all the force that the civilized nations may need to police the planet, and no more, would still be the equivalent of disarmament.

The ground of the argument for disarmament has shifted since the war. Previous to that catastrophe the abolition of overwhelming war machines was connected with the ideal of universal peace. It was a vision of something better, held mostly by "idealists." Now, however, it is a question of how the nations may become able to feed, clothe and rehabilitate themselves. The problem the world faces today is Food versus Guns, National Livelihood versus War Establishments. The greatest single expenditure of the nations is for militarism which is all outgo and no income; all waste, no wealth, and colossal Want.

Even at this hour, with whole sections of the world in need of daily bread, the agriculture of the neediest portions of the earth is suffering because the men are in the armies, and the wheat of the amply supplied nations is unobtainable because the surplus wealth goes for war. *We are collecting money throughout the country today to feed the children of the nations that spend in any single week enough money on munitions to feed the children of Europe for a year.*

It is not the demand of peace societies, nor of visionaries and idealists; it is the demand of the balance sheet—*shall the money go for bread or for guns?* When it came to a question whether the grain of the country should go for bread or for booze, the people decided for bread. When in England it became a question whether the land should be used for the sport of huntsman or for the production of the people's bread, it was decided in favor of bread. And now the question is the same. There is no doubt as to how all men, officials and civilians, answer it. Will they put the answer of their heads and hearts into the deeds of their governments?

We in America are accustomed to say that we ought to lead in this matter. There is no doubt about it, but it is not indispensable that we should. Suppose tomorrow Great Britain and France should say to the American people, "We are willing to disarm, if you are"—what would our answer be? And suppose that Japan should join the proposal. All of us can feel what a force such a proposal would have. That is looking at it as it would be were it coming to us from other nations. It would have the same force going from us to another nation. We are better prepared than any nation to go ahead in the race for armament. The rest of the world is bankrupt. We have the men, the money, the unspoiled country, and natural resources without limit. If we desire, we can eclipse the former Germany in land forces, and Great Britain in naval force. The world knows it. The world could not keep up with us save at a cost of distress greater than the last war brought, and eventually a great repetition of that tragedy. It therefore lies with us, if we can see it thus, to make the proposal to the world, sure of this invincible fact, that the rest of the world wants nothing so much, and is in need of nothing so much as this.

The question of method need not deter. If President Harding would prefer to call a council of governments, that all of them acting in concert may propose this policy, that is one way. It may be the way that would save the nations from feeling that they were following another nation's lead. He would know before the council was called that the nations wish to be free of the burden of armament which reduces every possible loaf of bread by nine-tenths and absorbs the lifeblood of the peoples' energies.

Again, to maintain a world armed to the teeth will cost more than the war cost. And to attempt it even while the debts of the war are making it impossible for the nations to feed themselves, is a folly which even fools would condemn. The question is not only one of disarmament, but a question of continued and increasing armament.

Nothing that the governments can do will mend the situation until this question is decided in favor of the people. After that, all fiscal problems become minor ones. The greatest single barrier to human prosperity will have been removed. And once removed, the conscience and the common sense of the world will never permit its return.

MASS MEETINGS USED BY JEWS

Artificial, But Effective, Method of Influencing Opinion; Banning "The Merchant of Venice."

Making the Bible Plain for Plain People

American Translation by Ballantine Clarifies the World's Best Seller

THE Bible is still the best seller in civilized languages, and is to be found translated into more tongues, civilized and barbarous, than any other book in the history of written things. In some languages it remains today the only written specimen; the missionary's conception of the spiritual importance of many tribes having done for them what their commercial, political and ethnological importance has never been sufficient to achieve, namely, given their dialects a vocabulary, grammar and syntax solely to convey to them the enlightenment of Holy Writ.

In these days, however, there have been a number of movements toward a re-translation of the Bible to give it a setting in modern terms. Not all of these have been happy in their results. The Revised Version, while in fairly wide use, is confessedly lacking in the chaste and simple grandeur of the Authorized Version. But just as candidly is it agreed that certain words and sentence forms in the Authorized Version no longer convey to our minds the exact sense of the Original, for the reason that the English words themselves have undergone a change in their value to public speech.

The only attempts along this line which can be regarded as serious are those which go back to the original sources, thus producing a genuine translation and not a mere revision of a previous translation. These have resulted in some very fine editions, especially of the New Testament, by men of devout scholarship. Among the best known translations now in use are The Emphatic Diaglott, by Benjamin Wilson which combines on the same page the Greek text with both literal and linear translation; Rev. Prof. James Moffatt's "A New Translation of the New Testament"; "The Twentieth Century New Testament," based on the Westcott and Hort Greek text; and the Weymouth New Testament.

These are all known for various values, the one common to all being the interpretative light which they throw on the more obscure passages of the Authorized Version.

These, however, are largely efforts of British scholars. There is another modern translation well worth notice in this connection because it is the work of an individual American and has won praise from the critics who are competent to pass on it. This is the translation known as "The American Bible," by Frank Schell Ballantine, the New Testament portion of which is completed and the Old Testament partially done. For a time it was the only strictly American work of special note, although there is now appearing in parts a publication called the "Concordant Version of the Sacred Scriptures" based on the Codex Sinaiticus and Codex Vaticanus, with full readings and photographic original text.

Mr. Ballantine was rector of an Episcopal parish in Pennsylvania when he began his work of turning the Scriptures into the speech of the people. Something of the ideal of Tyndale was in his mind, who said he "would make the New Testament so plain that even a plowboy could understand it." He approached his work through the medium of the French translation by Henri Lasserre in his Les Saintes Evangiles. Then, going back to the Greek, Mr. Ballantine produced, in five little volumes, the New Testament.

Clarification without vulgarization is the impression made upon the casual reader of The American Bible. He preserves the literary forms which have been made familiar to the American Bible reading public by Professor Moulton's "Modern Readers' Bible." But above all he gives to people unskilled in the ancient languages a clear impression of how unconventional was the original speech of the Book. The New Testament was written in the speech of the plain people, and one risk which a really fresh and true translation runs today is that of having its plainness mistaken for irreverent freedom on the part of the translator. But the translator may be only reproducing in the equivalent of our speech what the New Testament said in the street speech of the first century.

A few excerpts from this translation will serve better than any description can do to give the flavor of it. This from the First of Genesis:

"In the beginning God created the heavens and
the earth.
Now the earth was an empty waste;
And darkness was on the surface of the deep;
But the Mind of God was at work on the surface
of the waters."

This from the beginning of Mark's Gospel, dealing with the appearance of John the Baptist:

"John the Cleaner came in the wilderness proclaiming the cleaning a change of mind brings by effecting release from misdeeds."

This from the preface of St. Luke's Gospel:

"My Dear Theophilus:
"Many have undertaken to write a narrative of what has happened among us. In doing this they have followed the account of those eyewitnesses and servants of the word from the beginning who delivered them to us. So having traced the course of everything accurately from the first, it seemed good to me also to write you in due order, that you might know the certainty of what you were taught by word of mouth."

In this version the familiar Biblical "Behold!" becomes the plain everyday "Listen!"

The expression "He spake unto them this parable" becomes the plain "He gave them this illustration."

The term "tribute money" becomes in plain English "the two-dollar Temple tax."

There are certain clarifications of assistance to the careful reader of the Bible, such as that found in translating John 12:49 where Christ is reported as saying, "For I have not spoken of myself; but the Father which sent me, he gave me a commandment *what I should say and what I should speak.*"

The italicized words are redundant. They seem to repeat the same idea. The idea of redundancy is not compatible with any but the literary view of Scripture, which is admittedly an inadequate view. It is assumed that Jesus meant something by each phrase, but neither the Authorized nor the Revised Version gives a clue to what it may be. In The American Bible the italicized clauses read thus: *"What to say and how to talk about it."* Here we have the two meanings: the passage relates not only to the *substance* of the message but also to the *form* of it, and links with the expression of St. Paul, "Hold fast the form of sound words."

Also, in the Book of the Revelation, Chapter 22, note the italicized words—"And he showed me a pure river of water of life, clear as crystal, proceeding out of the throne of God and of the Lamb. *In the midst of the street of it, and on either side of the river, was there the tree of life.*" The Revised Version gives an alternative reading "a tree of life." In ordinary speech that is what it has come to signify, a single wonderful tree. Of course, a tree cannot be in the middle of the street and on either side of the river too, but trees of the same wood can be. Turning to the original the expression "wood of life" is found, and instantly the picture becomes clear. It is the picture of a woods, a grove of healing—an idea not at all incongruous, as all city-dwellers who enter the cool green aisles of an earthly wood well know. Thus we have in The American Bible the reading, as follows:

"And he showed me a river
of living water
Bright as crystal,
Proceeding out of the
Throne of God and
the Lamb
In the middle of the street.
"And on this side of the river
and on that
Was the Wood of Life
Bearing twelve kinds of
fruits,
Yielding its fruit every
month:
"And the leaves of the Wood
Were for the healing of the Nations."

A further example of clarity without any sacrifice of the form which has become classic is timely for the Easter season. It is St. Paul's discussion of the resurrection of the dead as found in the fifteenth chapter of First Corinthians:

"But some one will say: How are the dead going
to be raised?
And with what kind of a body are they going to
come?
You foolish fellow!
What you, yourself, sow does not spring into
life, unless it dies.
And what you sow, is not the future body,
But bare grain,
It may be of wheat,
Or of some other kind.
But God gives it a body just as he sees fit,
And to each of the seeds its own body.
Not every kind of flesh is the same.
But there is one kind peculiar to men.
Another peculiar to beasts,
Another to birds,
Another to fishes.
There are also bodies peculiar to the heavens,
And bodies peculiar to the earth.
But the brightness of the heavenly bodies is one
thing,
And that of the earthly bodies another.
The sun has its brightness,
The moon has its,
The stars have theirs,
For star differs from star in brightness.
It is the same, also, with the resurrection of the
dead.
It is sown in a state of corruption.
It is raised in a state of incorruption.
It is sown in an offensive condition.
It is raised in a condition of preeminent dignity.
It is sown in a state of weakness.
It is raised in a state of power.
It is sown a natural body.
It is raised a spiritual body.
If there is a natural body,
There is also a spiritual body.
And so it is written:
The first man, Adam, became a living soul.
The last Adam, a life-giving spirit.
Yet the spiritual is not first,
But the natural, and *then* the spiritual.
The first man is from the earth, and made of
earth.
The second man is from heaven.
As is he who is made of earth,
Such are those also who are made of earth.
And as is he who is of heavenly origin,
Such are those also who are of heavenly
origin.
And as we have borne the image of him who
is made of earth,
We shall also bear the image of him who
is of heavenly origin."

FRANK SCHELL BALLANTINE, an Episcopal clergyman and war chaplain who has worked for years to produce a modern version of the New Testament in accord with the original. Mr. Ballantine also works with his hands, as his portrait in carpenter's attire indicates.

The Good Samaritan

A LAWYER came forward and put him fully to the test, and said:

"Teacher, what shall I do to gain eternal life?"

"What is written in the law? How do you read it?"

"Thou shalt love the Lord thy God
With all thy heart,
With all thy soul,
With all thy strength,
With all thy mind;
And thy neighbor as thyself."

"You are right. Do this and you will live."

But wishing to vindicate himself he said to Jesus:

"Who is my neighbor?"

"A man went down from Jerusalem to Jericho and fell among robbers, who stripped him of everything, beat him, and went off leaving him half dead. Now a priest happened to be going down that road, and when he saw him, he passed by on the other side. In the same way a Levite also came to the place, and when he saw him, he passed by on the other side.

"But a Samaritan traveler came to him, and when he saw him he took pity on him and came and bound up his wounds, pouring in oil and wine, and put him on his own beast, and brought him to an inn and took care of him. And the next day he threw out two dollars and gave them to the inn-keeper, and said: 'Take care of him, and whatever more you spend I will repay you when I come back.'

"Which of the three do you think was neighbor to the man who fell among the robbers?"

"He who took pity on him."

"Go and do the same." —Luke 10.

Warren Harding, the Man

By A. R. PINCI

HARDING—The very name has a rugged and simple sound, easy to pronounce, pleasant to the ear, that comes easily to one's lips. To utter it means conjuring up an image, somewhat familiar if not recognizable. It lingers like the name of an old dispersed friend. And strangely enough it is not an image; it is the man, with a befriending and inviting occultism. He rather steals into our minds, regardless of politics, merely because his Americanism becomes manifest at once, which disposes the average person to yield to him now even if in disagreement with his views. Briefly, Harding symbolizes not a party, not a program, not a school of political beliefs, but an all-pervading nationalism superimposing constitutional precepts.

That explains his election; it explains, too, his unparalleled majority. Yet that is not all. It is a warning to the country that supergovernment, in the sense of achieving the marvelous or the impracticable, is not to be expected at his hands. As a statesman he must traverse uncharted routes but in such a way that the people can follow him step by step, thought by thought, dollar by dollar, result by result.

A few days after his nomination he voiced his diffidence in occupying so exalted a position, but such modesty had a distinguished precedent, for both Washington and Lincoln bespoke their hesitation under identical circumstances. This diffidence, however, is not characteristic of the man and his past record, as far back as his boyhood days, reveals instead a strong sense of opportunism. That diffidence intensified after the election, culminating with the painful remark that he was "the center of a veritable web of intrigue" and that there are "very few men" it is safe for him to trust. That remark was variously interpreted and quite erroneously. He is of too sincere a disposition to permit himself to dread his fellow men. Moreover, environment has favored him and throughout the years, certainly up to the hour of his nomination, the circle of trustworthy and unselfish friends constantly grew.

His quarrel was with the inevitable horde of political pharisees who began to trail him and tent upon his grounds from the hour he left Chicago. The last day of the convention he was eating luncheon—alone. Nobody paid any attention to him, even though his name had been among those "also mentioned," and he himself has since admitted that he felt very lonesome while he watched the feverish activities of other diners; even the newspaper men ignored him.

(C) Harris & Ewing

The President and Vice-President.

Imagine him, then, a few hours afterward become unexpectedly great—and the target for the most fickle of the human species: the professional politicians. Is it any wonder that even the probationary campaign period could not free him from the pettiness of selfish strangers so insistent upon saving the nation by means of public office? I believe that the process of elimination for a President-elect of the United States is the most irritating and disconcerting duty befalling man.

As I piece together detached recollections that go back to his first days in the Senate, five years or so ago, and they fuse together—meetings separated by time and cause in hours when his personality was at its best, untrammeled by suddenly unescapable popularity—my impression of him is reduced to simple and understandable proportions. To those who have mentally met him through the introduction of a likewise newly-introduced reporter, the picture is apt to be a little blurred; a little too sharp, in some cases, in the sense of the superhuman (in contradistinction to the superman) or a little too shadowy in the sense of small-town modesty.

For these deviations there is the amplest of reasons. It seems unthinkable to depict a President of the United States in terms of unadorned self. Yet the psychology of these variations is the key to the public's accepted belief of the President as an official personality of magic power or limited ability. People have become accustomed, since the war, the world over, to familiarize themselves with the words or deeds of men more or less in the limelight and, for want of a better word, bluntly described as "big." This became a stock adjective. It may have been noticed, however, that the term was never applied to Mr. Harding. Its absence is complimentary and no one is more pleased not to be so described than the President himself.

TO PORTRAY our President is not a difficult task if no retouching is attempted—a temptation that is not always successfully resisted. *Reductio ad absurdum* of the acres of newspaper pages or miles of columns printed about him, with their inevitable mixture of fact and fancy, leads to a sharper picture of a typical American.

Biographers and artists have clothed him with the toga of ancient Rome, but none has selected a more befitting garment—the scarlet gown of a cardinal. He would surpass in it any available painting of one, so perfectly does he portray repose and faith. His face is strong in every lineament; it is a composite of the features of George Washington and William Jennings Bryan (a twinship possible only in a perfect democracy like this). It is easy to distinguish the magisterial ardor of the latter and to account for the high-souled nationalism of the former.

By now about everybody knows that he is a well-proportioned man, six feet tall, with well-set shoulders, his hair almost entirely gray, his movements unstudied but impressive. His voice is resonant but well modulated; he smiles readily without evidence of a desire to please. He will converse freely with those who are in his confidence. He likes an anecdote as only an old-time typographer can—and poker equally well. He insists that his success in life is due to one thing—that Mrs. Harding has always been his best bet.

He is not a dynamic individual but of late it has been proved that it is not necessary to be dynamic in order to lead. He possesses all the characteristics of a man who can lead without finding it necessary to whip anybody into line or stand upon a platform in order to look a commanding part.

He has his ears to the ground, but as a mental contortionist, his feet there too. He is alert and has demonstrated his capacity in storing up information, some of it caught on the wings of the wind at a time when the wind was freighted down with it. He is not a great lawyer, but he is a practical newspaper man, and the latter must be one and the other.

It has been repeatedly asserted, since his nomination, that President Harding has incurred no enmities and is free to exercise his own good will as he deems best. The entire assertion, taken singly or otherwise, is open to doubt. He has quite a few enemies which spring up in the wake of any presidential meteor. Enmities, no matter how slight or inconsequential, cannot be averted by the President, and the

(Concluded on page 14)

The Thirtieth President?

CALVIN COOLIDGE, the thirtieth President of the United States! It is a rather startling prophecy on the eve that the twenty-ninth President enters into his new duties at Washington, but both are young, both are active, both have set a big job ahead of themselves, and both intend to finish it.

It cannot be finished in eight years, the time that the wiseacres allot to President Harding, hence prophetic rumblings from mysterious sources which the uninitiated can never hope to understand, happily for their peace of mind, are already busy with his successor.

This is politics. It is no reflection or offense to the incumbent to speak of a successor, but part of the game; preparedness—to use an overworked word. And there may be method in President Harding's desire to include the Vice President in his Cabinet meetings. It looks as though he is teaching Mr. Coolidge his P's and Q's.

Calvin Coolidge, like Theodore Roosevelt in the campaign of 1900, has been the political mystery of the last campaign. He emerged from state politics in 1919—as everybody knows—in connection with the policemen's strike in Boston, and rode for a time on the wave of popularity on the slogan of Law and Order.

But so much was said about law and order that Mr. Coolidge more than ever became concealed from the prying eyes of the people, and to say that politicians were thankful is to put it mildly. For a time so much was said about law and order that a foreigner who did not understand just what had happened while he was at sea believed that forty-seven governors elsewhere in these United States stood for force and disorder.

Vice President Calvin Coolidge is a most taciturn man, if measured along the lines of professional politics, but a most entertaining and interesting man if appraised as a human being who has something to say and on occasions—not always—is willing to say it. He has contributed relatively little to the verbosity of the campaign, but most of his declarations are epigrammatic, concise and self-explanatory.

His entrance into the national arena disconcerted many an ambitious office-seeker, not because Vice President Coolidge is in any way tempted to interfere with patronage prerogatives, but the inclusion of his name in the national ticket acts as a deterrent as it did in Massachusetts. Politicians and office-seekers thrive between the covers of dictionaries, so full of words are they, but using them at or against a listener who seldom reveals his own ideas is love's labor lost. They feel, and perhaps rightly so, that the Harding-Coolidge administration is going to be a régime of few words, and that automatically locks out the talkers. Even the Senate has adopted the habit of saying little between important speeches.

I believe that Vice President Coolidge will lose some of his reserve after a few months in Washington, where men after his own heart are far more numerous than they would be even in a city like Boston. That will be a good thing, because I believe the country is entitled to know him much better than it does. The most descriptive newspaper accounts about him, faithful to the extreme, do not quite convey to the citizen the personality of the Vice President.

It was my privilege to interview him in Boston last summer. He was unlike any other public official I had ever known, with the probable exception of Senator Henry C. Lodge. Both are typical New Englanders, but Senator Lodge's reserve is somewhat softened, perhaps by the years that even though they sit lightly upon him have reached the Biblical minimum.

Remembering the injunction to "Be Brief" I lost no time. He chatted very pleasantly upon the subjects I queried him about. These were the questions on the more delicate and pregnant subjects of the hour.

But how times have changed!

Who would have thought, in the days of Mark Hanna, that a Republican candidate would hide his light under a couple of bushels, as the Irishman explained once, to make concealment doubly sure. Yet that is just what happened, because his views are yielded as sought.

He is a typical New England gentleman—revealing the inflexibility of time-tried precepts by which he governs himself and his family. Which brings to mind the eloquent explanation made by Mrs. Coolidge to a reporter who wanted to know if she "considered her husband fitted for the office of Vice President."

"Judging by the way he governs his family, I should say he was."

Of course, she said nothing as to the way she governs him by delicious pies.

WHEN he stands he reveals an angular physique, suggestive of compactness, muscular as well as mental. His glance is sharp and quick, like an eagle's, and surveys without strain. No doubt he has the capacity for assimilation, but nothing about him implies submergence. It is more than understood that he has a well-developed sixth sense. He would be pained to believe that he was different from any of the millions of mortals in this country—and yet he is different in two specifications:

First, there are no anecdotes about him, unless they can be turned from epigrammatic sayings;

Second, affording it, he has never owned an automobile, although Mrs. Coolidge has said that some day she hoped to own "a Ford." Just now the government is providing them with a motor car.

One judges the weight at 145 pounds or so, but in Massachusetts they say that he weighs 145 tons politically—a new way of appraising public men.

His voice, which is not adapted to public speaking in great halls, brings to mind a story, not told by Mr. Coolidge, who probably doesn't even know it.

It seems that during the campaign for the governorship about three years ago he had occasion to stop at a small town, but not on a political mission. Friends induced him to treat admiring inhabitants to a speech, and upon investigation they found that there were two halls available; one which would hold about thirty-four persons, including standees, and the town hall, which might accommodate one-half of those who would like to hear him.

The local informal committee discussed the merits of each place.

"I'd be for the little place," said one.

"But 'twon't hold the crowd," was the objection.

"Yes, but at least everybody can hear him," the former contended. "In the big hall—his voice won't fill it."

3. Write clearly.

Well Begun!

BOTH in his inaugural message and in the selection of his official family, President Harding has made a good start. It promises much for the success of his administration that both utterance and action instantly captured the favorable attention of the country. It is not too much to say that in this very beginning he did much to counteract the impression created in some quarters during the campaign that, being a man without decided convictions of his own, he would prove subservient to party leaders in the Senate; one inclining toward illiberal "reaction" and devoid of high idealism or any vivid appreciation of the tremendous problems he would be called on to face and handle.

He has inspired a certain confidence in his conception of the country's needs in various directions and in his determination to meet those needs by the application of common-sense measures and methods. Both in what he had to say and in what he left unsaid, Mr. Harding struck a response in the American people. He told them what they wanted to know. He told them he proposed to work for disarmament. He told them what he proposed to do about lightening the burden of taxation and bringing about a more equitable distribution of its incidence; about accomplishing reforms in the direction of efficiency and economy in governmental departments; about just recognition of the rights of the workers and provision in many ways for the greater welfare of all the people.

President Harding's quaint campaign phrase as to the supreme necessity of a return to "normalcy" in the everyday business life of the country sounded as a keynote and found expansion and confirmation throughout his inaugural speech. He left no doubt as to his determination to bring "horse sense" to bear in effecting readjustments in both our foreign and our domestic relations. He spoke as a plain man to plain people and with much moderation and good sense.

The cabinet is one which, on the whole, must prove a strong re-enforcement to his administration. It was inevitable that the appointments of Mr. Daugherty and Mr. Hays should be criticized as "purely political." Both men, however, have shown exceptional organizing and administrative ability in other fields and there is a disposition to give them a chance to show what they can do. It must not be forgotten that our government is one of political parties after all, and that if party government has its disadvantages it also has its advantages. It is something to be able to place responsibility on a definitely organized group.

All in all, while the appointments may not satisfy every one, it is important to note that just as President Harding does not himself propose to serve merely as a "rubber stamp" for any "Senate Cabal," so he expects every member of his cabinet to "speak for himself" and be his own man. He is wise.

Silesia's Plebiscite

IN CONFORMITY with the Treaty of Versailles, a plebiscite will be taken in Upper Silesia, on March 20, to determine whether that province shall remain German territory or become part of the Polish Republic. On the result of this expression of the people's will at the polls, the peace of Europe and of the world may be said to hang.

"Self-determination," in this instance, is much more complicated than it was in the Schleswig-Holstein plebiscite. Germany claims that an overwhelming majority of the inhabitants of Upper Silesia are German in race and in speech and that they at heart favor continuance as a part of the German Empire. The Poles, on the other hand, insist that regard for historical and ethnographic frontiers makes the territory Polish. With characteristic heat and fervor, Polish agitators have been proclaiming this view during the past two years. To the support of the contention, heated appeal is made to Polish national pride, tradition and historical continuity.

Under all these surface contentions, it is understood, lies the real crux of the dispute. Each of the claimants greedily covets the rich coal and iron deposits of Upper Silesia. And this greed is, in a sense, justified by the pressing need of each for the supply of raw materials necessary to the building up of its industries.

Should the election go in Germany's favor, it is reported, Walter Simons, the German Foreign Minister, has assured Lloyd George that the payment of the indemnity demanded by the Allies would be brought within the realm of possibility. His only fear of an adverse decision (on the face of the returns) is that the Allied troops policing the plebiscite area will support Polish agitators in intimidating the Germans there from casting their ballots and expressing their free choice. In such case, the French would feel obliged to extend their military occupation to practically all Germany and perhaps to seize the Ruhr Valley permanently. Indeed there is not lacking the suggestion that what France really wants is the Ruhr Valley, rather than the more or less mythical German milliards. This to assure French industrial supremacy and German industrial crippling and exhaustion.

Of course, this occupation would not produce the three billion of gold marks annually demanded by the Allies, and both the French and the British premiers are well aware of that fact. Consequently, it is suggested that both M. Briand and Mr. Lloyd George may be very glad to "save their faces" through a plebiscite favoring the Germans. Accordingly, it is believed that they have promised Herr Simons that there shall be an honest ballot and a fair count on March 20 in Upper Silesia.

The entire situation stresses the importance of removing the international distribution of raw materials from the region of national greeds and jealousies, if we are to eliminate one of the most fruitful causes of future wars.

Wants a $50,000 Man

PROVOCATIVE of mixed reflections is the news that Postmaster-General Hayes is seeking a $50,000 man for the $5,000 job of Second Assistant Postmaster-General. This official has supervision of the railway mail service, the air mail and allied activities. The presidents of a number of the big railroads have suggested the names of high-class operation executives in response to the Postmaster-General's request, and he hopes to induce one of them to take this important government job from "considerations of patriotic duty."

It may well be asked, to start with, whether it is dignified or even honest for the Great Republic to pay any public servant only one-tenth of what his services are worth in the open market. The traffic manager of even a small town chamber of commerce, or of any large manufacturing concern, easily commands a salary larger than that which the government pays to its Second Assistant Postmaster-General, although the latter position is one of immensely greater responsibility and one demanding far larger experience, skill, judgment and ability generally.

Nor is willingness to sacrifice salary a fair measure of any man's patriotism. Having "patriotic" regard to his personal and family obligations, many an able man earning from $10,000 to $50,000 in private life—and probably spending it on his home, living and the education of his children—might feel that he could not afford to give up his salary for a public position, however honorable, that barely paid his house rent in Washington. The scandal and the false economy of being restricted in our diplomatic appointments to millionaires able to spend several times the amount of their salaries that they may sustain the nation's dignity in a foreign capital out of their own pockets, should have taught us the unwisdom of this course.

Lastly, we come back to the utter falaciousness of making money the measure of the man. If a man is "on to his job," no other test is necessary. Neither the $12,000 salary paid to Charles E. Hughes as Secretary of State, nor the $150,000 he earned in his private legal practice is a true gauge of his value in his present job. It is just as true today as it was 2,000 years ago that "the laborer is worthy of his hire"; but the hire, in either public or private employment, should also be worthy of the laborer.

"All They Possess"

THERE is much that is as inspiring, as it is pathetic, in the advertisement of a laborer and his wife in a small Michigan town seeking news of a vanished daughter. This humble couple offer to give "all that they possess" for news leading to the recovery of the lost child.

As an earnest of good faith, they append an inventory of their entire possessions. It is not a long list: a cottage home and furniture worth $1,400 and paid for out of a lifetime's earnings; $200 in the bank, the father's silver watch and the mother's wedding ring. For the restoration to their arms of the loved daughter, they will gladly surrender all. Homeless and penniless they will cheerfully start life all over again.

Everything is relative in this world after all. This humble couple offer for their daughter more in proportion than the million dollars offered by the Kansas City packer, Cudahy, for the return of his kidnapped son. And they are wise. They are wiser than was John D. Rockefeller in his reputed offer of ten millions for a new stomach, or the late Andrew Carnegie in his willingness to pay ten millions for a guaranty of ten years more of life after seventy. Love is decidedly the greatest thing in the world. For love, this laborer and his good wife find no material price too great to pay, no sacrifice worth counting. They are like the wise man in the parable, glad to sell all that he had in order to buy the pearl of great price. "What shall a man not give in exchange for his life!"

A Shock to Politicians

IT MUST have been as disappointing to the politicians as it was gratifying to all Americans mindful of the reproach of the spoils system of which the post office was so long the stubbornly defended last intrenchment, to learn that one of the first steps contemplated by President Harding is an executive order extending the merit rule to all appointments of postmasters.

The terms of some 90,000 first and second-class postmasters will expire in the next month or two. It had been quite generally assumed that the new administration would grasp the opportunity to strengthen the party machine by making a clean sweep of the Democrats and giving these jobs to Republican henchmen as rewards for party service. In his first mail at the White House, President Harding found a new broom labeled with the sapient counsel: *"Use it!"* Office-seekers among his followers, hungry and thirsty after an eight years' fast, descended like a plague of seven-year locusts on the national Capitol in the weeks following his inauguration.

It is probable that many of the job-hunters based their hopes on the appointment of Will H. Hays as Postmaster-General. The facts that Mr. Hays had served as manager of the electoral campaign that landed Mr. Harding in the presidency, and that he was noted chiefly as an astute politician and party worker, lent some color to the assumption that the post office would now be prostituted to political aggrandizement. Most of the unfavorable criticism of the President's cabinet appointments by his political opponents, was leveled at his selection of Mr. Hays. Hence the surprise to the country contained in the assurance that both the President and his Postmaster-General are determined to keep the post office out of politics and politics out of the post office, carefully safeguarding and improving it as an institution for public service.

Such a good beginning deserves all possible appreciation. Let the good work go on!

Nipped in the Bud

SCORE one for the new Secretary of State! He had hardly been seated at his desk when Mr. Hughes was called on to act and act decisively in the little war that broke out between the republics of Panama and Costa Rica. His demand for the immediate cessation of hostilities was complied with and the mediation of the United States accepted.

For some time past it has been evident that there were trouble breeders actively at work inciting hostility to the United States throughout Latin America. Panama at the start appealed to the League of Nations to intervene—a plain blow at the Monroe Doctrine evidently shrewdly planned by sinister agencies. This appeal was withdrawn on a swift and sharp hint from Washington. So for the present, at least, a flame which threatened to spread into a continental conflagration has been extinguished—a malignant plot nipped in the bud.

It will be well, however, to keep a watchful eye on Panama. For generations, the Isthmus has been a veritable nest of the "formidable sect."

Mr. Ford's Page

THE pull of gravitation upon us is mostly felt in the desire to find some routine that will almost run itself, to organize a business that will operate itself automatically and for an indefinite period, to strike a single comfortable rut and to keep it. This is the downpull which men ought to resist, especially in these changeful times when the future is offering itself to foresight, and will be the servant of those who are able to detach themselves from the familiar and adventure with the new.

In the horse age we used to see this tendency represented in animals who were accustomed to a certain daily round. The doctor went to certain houses, and his horse became accustomed to stop there, and would always turn in whether reined in or not. The milkman went his round, and his horse behaved as if displeased if any change was made in the daily program.

Men fall into the same half-alive habit. Seldom does the cobbler take up with the new-fangled way of soleing shoes, and seldom does the artisan willingly take up with new methods in his trade. Habit conduces to a certain inertia, and any disturbance of it affects the mind like a trouble. It will be recalled that when a study was made of shop methods, so that the workman might be taught to produce with less useless motion and fatigue, it was most opposed by the workmen themselves. Though they suspected that it was simply a game to get more out of them, what most irked them was that it interfered with the well-worn grooves in which they moved.

There are business men who are going down with their businesses because they like the old way so well they cannot bring themselves to give it up. One sees them all about—men who do not know that yesterday is past, and who woke up this morning with their last year's ideas.

It could almost be written down as a prescription that when a man begins to think that he has at last found his method, he had better begin a most searching examination of himself to see whether some part of his brain has not gone to sleep. There is a subtle danger in a man thinking that he is "fixed" for life. It indicates that the next jolt of the wheel of progress is going to fling him off.

The only business that has a promise of security is the business whose manager has hardihood enough to change it, even though he may love it ever so much, when his common sense tells him that a change is coming. It is a hard thing to do, but the hard things are usually the right things to do, and a man is better for following his vision instead of his "likes."

And what makes it hard? It will not be hard for the man who comes to do it for the first time—why is it hard for the other? Because he has softened down into the old methods; he has allowed them to mold him, instead of himself molding them; he has become a creature of his method, instead of its controller.

The past has a strong hold on us through its detail. We cannot break with the past, but we can scrape off the clinging seaweed of its details. We can break down the whimpering laziness of mind which resents the intrusion of new methods. We can acknowledge each day as a new day and not a mere repetition of yesterday.

Life is not a "battle" except with our own tendency to sag under the downpull of the habit of "getting settled." If to petrify is success, all one has to do is to humor the lazy side of the mind: but if to grow is success, then one must wake up anew every morning and keep awake all day. Great businesses become but the ghost of a name because some one thought they could be managed just as they were always managed, and though the management may have been most excellent in its day, its excellence consisted in its alertness to its day, and not in slavish following of its yesterdays.

THE periods between changes become shorter and shorter. Formerly several generations could pass between changes, but now several new periods appear in a single generation. The world is accelerating its pace toward some new position. This requires of men constant readjustment and is hard on those who resent being shaken out of their ruts. There is a natural tendency to sag down, to organize our business so nicely that it will run itself. Nothing runs itself, and nothing can be successfully run the same way for long. Success in the first degree requires foresight of coming changes. Success in the second degree requires a willingness to adjust oneself to changed methods as soon as the signal appears. The comfortable ruts all drain at last into the ditch by the side of the road.

It is not likely there shall ever be many really new things to do, but it is certain that most of the old works shall be performed in a new way. Fundamentally, agriculture will always mean producing foodstuffs and cloth-stuffs from the field; transportation will always mean conveying materials by wheel across the surface of the earth or by bottoms across the surface of the waters; manufacture will always mean armies of men working raw materials into articles of use.

Everything we now point to boastfully as evidences of our progress consists simply in doing some old work in a new way. Most of that progress consists in getting light from filaments instead of tallow, getting wheel-movements from fire instead of ox-muscle. Most of the history of material progress can be written as a story of the successive ways by which wheels have been made go round. There is nothing new except in the way it is done.

Society is always in danger from two classes, those who fear change, and those who crave it. The first class tends toward decay, the second toward destruction. Change is not to be sought for itself alone, but in following to best advantage the obvious beckoning of the times.

There is always something outside ourselves that gives the signal; a motion of advance that comes over the earth like the coming of spring, and those that are alive respond to it; those who prefer to continue their hibernation in the old methods, fall out of step with the advance. They remain comfortable enough, no doubt, but they no longer count.

It pays a man always to have ideas in advance of what he is doing; that is the only valuable capital.

Changes are coming in every field, and the cause of the jagged interval between two periods is men's hesitancy to give up the old and plunge into the new. The old leaves fall to make room for the new. The old methods are suddenly found to be inadequate because new combinations are arriving. The sleepy side of our minds complain that we are being shaken out of our old life; the vividly alive side of our minds would show us, if we would permit it, that we are only being shaken into our new life.

It is not given to every generation to pass through a period of change. Life ran placidly for our forefathers for long stretches at a time, and in the older countries a certain method of life became so fixed that it left century-long traces on city and countryside. But in these latter days the intervals of change become shorter and shorter. The pace is quickening. Period follows period out of all reckoning with the old calendars. We have seen an almost complete revolution in the past fifteen years, and now we are on the eve of another; and as soon as that will have come, another will be visible on the horizon. The world is moving with breathlessly eager haste to some new position, and we cannot stop it. We can only stop ourselves from following along.

Life is not a location, but a journey. Even the man who most feels himself "settled" is not settled, he is probably sagging back. Everything is in flux, and was meant to be. Life flows, and is not in the same stretch of country for very long. Even the solar universe, we are told, is flying along like a flock of shining birds, always occupying a new position in space. We may live at the same number of the street, but it is never the same man who lives there.

These facts may be resented or welcomed: the man who acknowledges them in a practical way in the form his service takes will always find himself in service; the others will be retired. Finding it hard to give up an incrusted method is a sign of a hardening of the mind which, like the hardening of the arteries, is not to be neglected.

Making a Playground of the Yellowstone

By R. P. CRAWFORD

LAST year 79,777 persons went through Yellowstone Park, a few—the more hardy explorers and naturalists—on foot, some on horseback, but most of them in automobiles. Years come and go and the Yellowstone increases in popularity. When it comes to size there is no comparing of Yellowstone with any of our other national parks. Many of its more than 3,000 square miles have hardly been explored. Many other national parks are mere pigmies in comparison. Even Mount McKinley in Alaska has only 2,200 square miles, and Glacier Park less than half the number of acres of Yellowstone.

When it comes to age, Yellowstone is the oldest of our national parks, with the exception of the Hot Springs Reservation in Arkansas, which, however, embraces only one and a half square miles. When it comes to number of tourists, Yellowstone leads all parks with the exception of the Hot Springs Reservation and the Rocky Mountain National Park north of Denver.

But the most important point is that we are coming to look upon Yellowstone more and more as a national playground. It is no longer something merely to be hastily glanced over and then passed by. One could spend a month there and not comprehend half of the interesting things. This same point applies to all of our national parks in lesser degree. Back in 1916 the number of persons that visited all our national parks totaled 396,097. But during 1920 the visitors at the parks totaled 1,047,455, this latter figure also including 138,951 who visited our eleven national monuments. The national monuments might be known as our lesser national parks, containing features of smaller interest, and generally being of much smaller size. About 140,000 of the total number of tourists visiting the national parks are also accounted for in our comparison by the fact that the Mount McKinley National Park in Alaska, the Grand Canyon Park in Arizona, the Lafayette National Park in Maine, and the Zion Park in Southeastern Utah have been added since 1916.

The name of park is perhaps a little misleading to those who think of a park as a few acres set aside in the big cities of our country. But it is to be hoped that in the same way that these are breathing places in the cities, so the national parks may become recreation spots for the country at large. As the country becomes more and more closely settled, there will be more and more demand from people who desire to get away for a few weeks and enjoy life in the open. This, of course, does not take into consideration the outstanding scenic features that are embraced in each national park and must be preserved for posterity.

So this oldest and greatest of our real national parks still retains its popularity. But no longer is the park restricted to the occupants of the rubber-neck busses, who must see the park in the quickest, shortest, briefest way. One does not have to put up at the $6 up hotels or even at the more inexpensive camps. Thousands of people are learning to go through the park in their own automobiles with their own bag and baggage. At convenient points along the way provision has been made for places for campers, where they may keep house in rustic fashion for two days or two weeks. They can come and go as they please, observing, of course, the park regulations.

When the first private automobile rumbled into the park one morning in August, 1915, there were those who shook their heads disdainfully and proclaimed the doom of the park. I must admit that riding in the old stagecoaches was romantic and even the hold-ups staged by bandits now and then added an enjoyable thrill to the journey of those who sought for the real pioneer conditions. Even today the scenes of those hold-ups are passed with a little shiver of delight.

But it was readily apparent that if the park was to accomplish its real purpose and attract the common people of the country, the automobile would have to be admitted sooner or later. So it was well to make arrangements for the hospitable accommodation of those people who brought their own camping equipment.

In many of the free automobile camps which have been established, pure water is always available and firewood close at hand. Cooking grates are provided and special attention is given to sanitation. Of course there are hundreds of other sites that may be used by campers who enjoy the greater freedom of an open wilderness.

The Yellowstone is now provided with splendid roads comparing favorably in every way with the boulevard roads of a city. One may enter the park on the west, north, east or south. Undoubtedly the latter road will become increasingly attractive since it leads through the Jackson Hole and Teton country, a region of interesting history and splendid scenery, and as better roads are being gradually developed outside the domains of the park on this side. The road system is so arranged that one may make a circuit of the park and see all important features with the least possible inconvenience. But there is plenty of opportunity to get off the beaten track, and on to hundreds of trails that lead in every direction, a paradise for the hiker and horseback rider.

But the first step is to provide oneself with the book of rules and regulations and the pamphlet for automobile tourists and one has a veritable guide of information. There are similar publications for practically every one of the national parks. Then the large-size topographic map should be added, especially if one desires to get off the beaten path, and explore the park to any extent. And, almost needless to say, one should not neglect plenty of bedding and warm clothes, for the evenings and early mornings are indeed crisp.

In fact, just about the same thing applies to all of our national parks. There are guide books supplied free of charge by the National Park Service, and numerous pamphlets detailing specific features of interest can be secured for a few cents. It is a good plan to invest a couple of dollars in this sort of material before one starts out, and one will have a veritable library of all that is interesting along the way, from notes on the bears to scientific treatises on the geological formations of the park.

On a recent trip to Salt Lake one man volunteered the information that it was foolishness to spend even four days seeing the park, that one could see it just as well in two and a half days. That would be much like riding down Broadway in New York and saying that one had seen the city. One should not move too fast if he would see the beauties of the Yellowstone. Most people see the park with a rush and a push that leaves no time for the pure enjoyment of a vacation. There are perhaps better and more interesting opportunities for fishing in Yellowstone than there are anywhere else. Of course hunting is prohibited, unless it be with a camera.

Certainly a vacation can be spent just as easily in the Yellowstone as anywhere else. The point, of course, is that while it is a land of supreme scenic wonders, it is a recreation ground as well.

No doubt one reason for the somewhat hurried trips in the past has been the expense. It is true that $6 a day at the hotels or around $4 at the camps for a family of four or five makes pretty big inroads on the vacation fund after a few weeks, but now that it is possible to do one's own camping, the question of expense hardly enters in, any more than taking an ordinary automobile trip.

As far as the ordinary wonders of the park are concerned, there are usually just about four things that especially engage the attention of the average traveler. The geysers and hot springs, the canyon, the lake, and the wild life in the park. There are a thousand smaller things, each of which in an ordinary case would be sufficient reason for a summer resort.

Mere superlatives in describing the features of the park are probably unnecessary. Practically everyone knows that there are more geysers in the Yellowstone than in any similar area in the world. The most prominent of them are in what are known as the Upper and Lower Geyser Basins. Here is found the Old Faithful Geyser which gives its performance practically every hour, the Giant Geyser which essays to perform every six to fourteen days, and a score or so others which perform as the mood suits them. Years ago it was said to be possible to coax the geysers into action by dropping a piece of soap into them, but this is prohibited at the present time. It is reported that the action of soap on geysers was first discovered by a Chinaman who unwittingly washed his clothes in one of the basins. Many of the geysers are irregular in their actions.

The Lower Geyser Basin, located about five miles from the Upper Basin, no longer boasts as active geysers as the Upper Basin. But it was here that the famous Excelsior Geyser, which ceased playing in 1888, was wont to throw its water as high as 300 feet. But there are still some remarkable phenomena here, such as the Mammoth Paint Pots and the Prismatic Lake, with its remarkable colors.

When one recalls how little credence was given to the early reports brought back by explorers from this section, one realizes how unique this park really is. The theory of geyser action is simple enough, but the sight of these smoking columns of water inspires a certain reluctance to have them explained. Of course, they are due to water trickling down to the region of intense heat, which in the case of geyser lands is necessarily near the surface, forming steam which in turn expands and forces out the water that lies above it.

What is known as the Norris Geyser Basin in the central part of the park has fewer real active geysers and is quite variable in its action. But the sight of the great columns of steam rising here and there over an area of several acres is a never-forgotten sight. Not far from here is Roaring Mountain, where a great hillside is the scene of numerous steam vents.

The hot water phenomena around the Mammoth Hot Springs in the northern part of the park are as interesting, but less fascinating than the geysers. Here white mineral deposits, brought to the surface by the hot water, have formed gigantic terraces, and even, in some places, engulfed trees. Many of these terraces have been given a reddish hue, due to the growth of algae, or tiny plants.

But for many years people were so accustomed to associate the Yellowstone with geysers that they forgot that it was the home of one of the greatest canyons of the world, the Grand Canyon of the Yellowstone. Probably no other canyon can equal it in color, varying from yellows to bright reds and purples. It is said that this coloring was due to the long-continued action of hot vapors arising from geysers and hot springs. In fact, close to the river's edge in the canyon may be found some still active steam vents. For three miles or more below the Lower Fall this riot of color continues. The canyon is nearly a thousand feet deep and two thousand feet across at the rim. The Lower Fall of the Yellowstone which marks the real beginning of the canyon is twice the height of Niagara. And yet, despite the splendor of this scene, it receives only comparatively scant recognition the country over. In fact, there seems to be so much to see in Yellowstone Park that any one of the numerous spectacles is lost in the grandeur of the whole.

Yellowstone Lake, with the mountains stretching away to the horizon, would pass for a magnificent lake anywhere. Tower Fall, with its 132-foot drop, the petrified forests, Dunraven Pass, a score of mineral springs—in themselves sufficient to start a health resort—a cliff of solid glass, not to mention the splendid mountain vistas in themselves, furnish never-forgotten scenes. Nor should one forget the Yellowstone bears or buffaloes. There are more wild animals that can be readily seen in the park than in any other place on the American continent. A recent report from the National Geographic Society indicated that the number of black bears in the park totals nearly one hundred animals, together with about twenty-five grizzlies. The comparative frequency with which bears are seen might lead one to the belief that there were many more. However, the Yellowstone bears always make themselves conspicuous around the garbage piles. It is believed that about 25,000 elk still remain in the park, including those on the Teton game preserve south of the park.

It is hoped that the future will see a great area to the south of the park added, which will bring into the park proper the Grand Tetons and Jackson Lake. Already this district has been claimed by many summer tourists, and many maps show this as being virtually within the park. Originally the "Jackson Hole Country," the home of bandits, it gives every promise of becoming one of the country's greatest scenic spots.

Lower Fall of the Yellowstone, twice the height of Niagara.

1. Old Faithful Geyser, which never fails.
2. Grand Canyon of the Yellowstone, the coloring of which is perhaps equaled nowhere.
3. One of the numerous camps for automobile tourists.
4. No story of Yellowstone would be complete without a bear.
5. Yellowstone Lake.
6. Down in Yellowstone Canyon, 1,000 feet deep.
7. Looking across the terraces at Mammoth Hot Springs.
8. Where even trees have been engulfed by the accumulation of white mineral deposits.

"Jewish Rights" to Put Studies Out of Schools

Anti-Defamation League Boycotts William Shakespeare; Fury of Mass Meetings an Artificial and Staged Fury; B'nai B'rith History

THE organizations of Jewry are numerous and widespread, all of them being international in tone whether so chartered or not. The Alliance Israelite Universelle is, perhaps, the world clearing house of Jewish policy, with which every national aggregation of Jewish societies has affiliation.

The Independent Order of B'nai B'rith, which is now hopeful of reaching the 1,000,000 membership mark, is frankly international. It has divided the world into 11 districts, seven of which are in the United States. Its lodges at last report numbered 426. The four members of its executive committee who do not reside in the United States, reside in Berlin, Vienna, Bucharest and Constantinople, respectively. Its lodges have been set up in the United States, Europe, Asia and Africa. Henry Morganthau's name appears in the 1919-1920 Jewish year book as a member of this executive committee. Mr. Morganthau will be remembered as the American Minister to Turkey, later talked of as Ambassador to Mexico, then chosen by President Wilson to mediate between the Turks and the Armenians. Mr. Morgenthau also investigated for the President the reports of Polish pogroms.

In studying the executive committees of Jewish societies it is strikingly evident that the same minds guide all the important ones. A few names recur again and again. They are the names one meets at all Senate hearings, at various strategic places in the War Government of the United States, and at every stage of Jewish interference with American foreign policy. Everything centers at last, apparently, in the American Jewish Committee and the executive committee of the New York Kehillah. Judge Mack, Judge Brandeis, the Warburgs, the Schiffs, Morgenthau, Wolf, Kraus, Elkus, Straus, Louis Marshall—these names appear over and over again, in offensive and defensive action, in all big affairs.

There are now in the United States 6,100 reported Jewish organizations. Of these, 3,637 are in New York City. This figure is offered from the 1919-1920 year book, although the statement was recently made that the New York Kehillah is the clearing house of 4,000 organizations.

Enough is shown to indicate how fully organized the Jews are, how they are linked together by every conceivable bond, the material of every bond being their racial likeness.

First Saw Light in Saloon

THE organization about which the public has heard most is the Independent Order of B'nai B'rith. Its headquarters are not in New York, strange to say, but in Chicago. Its origin, however, as might be expected, was in New York.

This interesting order, without a reference to which no survey of Jewry is complete, came into existence in the back room of an Essex street saloon in 1843. Strangely enough, its most moving spirit at the beginning was a Henry Jones, although his colleagues retained their Hebraic names.

Because most of the founders were from Germany the name was given in German, Bundes Bruder, which is in Hebrew, B'nai B'rith (Brothers of the Covenant). The executive committee was known as The Elders. The order spread first to Cincinnati, apparently taking the course of German immigration through the country, and it is recorded that the second lodge in that city is the first where the English language was used in discussing lodge affairs. The first leap of the order abroad, was to Berlin where in 1885 Grand Lodge No. 8 was installed, followed soon after by Grand Lodges in Rumania and Austria. The order's literature lays stress on the work of inculcating patriotism which is said to be one of B'nai B'rith's special interests. It is perhaps not meant, however, that the head office at Chicago could undertake, especially during recent years, to guide the patriotism of all the districts throughout the world. It would have been rather awkward for District No. 6, which includes Illinois, to encourage District No. 8 to loyalty, seeing that District No. 8 embraced Germany.

The Order has not avoided the political field. The diplomatic history of the United States in the last 70 years is dotted all over with indications of B'nai B'rith activities. Oscar Straus, writing from the Legation of the United States at Constantinople in 1889, tells Secretary of State Blaine that the Jerushalaim Lodge of B'nai B'rith at Jerusalem was quite satisfied with the way in which the State Department had attended to a certain matter at the lodge's request. Mr. Morganthau in the midst of his investigation of the false pogrom rumors on Poland, goes to a B'nai B'rith lodge. In 1870 Brother Benjamin F. Piexotto was appointed "as United States consul at Bucharest for the express purpose of securing an amelioration of the condition of the shockingly persecuted Jews in Rumania." The "persecution" in Rumania was the protest of the Rumanian peasantry against the two greatest menaces to the peasant farmers—the Jew-controlled liquor and mortgage traffics.

But this special appointment was made "in pursuance of suggestions made by the Order, and the negotiations were carried on chiefly by Brother Simon Wolf."

Simon Wolf has been the official Jewish lobbyist at Washington, on fixed post, for fifty years. He could write an informative story of the relation of B'nai B'rith to diplomatic appointments, if he would. It was he who suggested to William Jennings Bryan, when the latter was Secretary of State, that a Jew be appointed Minister to Spain to show Spain that the United States did not approve Spain's act of expulsion back in the fifteenth century. Jews are also suggesting to President Harding that a Jew be appointed Ambassador to Germany to rebuke the Germans' resentment against Jewish control of finance, industry and politics. This conception of the United States Diplomatic Service as a convenient agency for the transaction of Jewish world affairs has been in existence a long time, and has accounted for some of the strange appointments which have puzzled the people.

The Judaizing of the East

IT IS worth noting that while American Jews are crowding the eastern diplomatic posts with as many Jews as possible, British Jews are doing the same thing in the Judaization of the Persia, India and Palestine governments, so that the whole mid-Orient is now under Jewish control, and the Mohammedan World is given to understand that the Jews are merely coming back from their conquest of the white races. To those who have observed the Jewish attempt to seek a rapprochement between the followers of Moses and Mohammed, the situation is one of the keenest interest.

The B'nai Brith is made up mostly of the more liberal Jews, religiously speaking, and doubtless includes a large number who are also liberal, racially speaking. The time when it stood as spokesman of Jewish ideals is now long past; it stands today the center of certain Jewish activities. It does not supersede the American Jewish Committee by any means, but it is the encircling arm, with fingers everywhere, through which the committee can get its will carried out. When there is anything to be *done*, the B'nai B'rith is the organization which takes the lead in putting it over. It may be described as a *freemasonry exclusively for Jews*. This brings up another characteristic that people have noticed and discussed: the Jew demands as his right entrance into other Orders; into his own he admits none but Jews. This one-sided policy is found everywhere.

Chief among the B'nai B'rith's activities in so far as they directly relate to the rest of the people, is the work of the Anti-Defamation League. This inside committee in every lodge attends to the espionage work necessary to keep the Grand Lodges informed as to what is going on with reference to Jewry in the United States. In its work, the Anti-Defamation League always takes the offensive and works along pretty well defined lines.

How the League Works

ORDINARILY the head of the Anti-Defamation League in each city is a man competent to bring pressure to bear on the public press. Sometimes he is the head of an advertising agency which, as a rule, pools the Jewish department store advertising of that city, so that the newspapers may be controlled from that angle. Sometimes he is himself a heavy advertiser pledged the co-operation of other advertisers in whatever he undertakes to do. The Anti-Defamation League is the instrument through which all boycotting tactics make their appearance. This league not only makes its protest from without, but directs reprisals from within. It is an exceedingly militant body and does not always depend upon "the rule of reason" in its activities.

Many quaint tales could be told of the operations of the Anti-Defamation League in various American cities, but as the present articles attempt to give no more than a bird's-eye view of widespread Jewish activities, mere story-telling will have to wait.

But perhaps the most notable accomplishment of the league has been the suppression of the word "Jew" in the public prints in any but the most laudatory connections. For a long time in the United States the people did not know how to refer to the Jews, whether as Hebrews or Israelites or what, because the fear of giving offense had been so diligently cultivated in all quarters.

The result was that other nationalities were laden with all the undesirable publicity which the Jews had evaded through the efforts of the Anti-Defamation League. Recently a Jew was on trial for the murder of his wife. The newspapers referred to him as "a pert little *Englishman*." The Russians in the United States, and the Poles also, have been filled with indignation by the extent to which their national names have been used in police and newspaper reports to conceal the identity of Jews. The Russians resident in this country have several times been compelled to remonstrate with the press for its misrepresentative practice in this matter.

For this state of affairs the Anti-Defamation League receives the credit. Whenever a newspaper printed the word "Jew" as an identifying noun after the name of anyone who had been discredited, the Anti-Defamation League was instantly on the job in protest. The stock argument is, "If he had been a Baptist or an Episcopalian you would not have told it, and why should you say that he is a Jew—'Jew' being a mere religious denomination." City editors are obliging and the rule became established. In principle it is right, although it is urged on wrong grounds; but in practice it has turned out to be a great injustice to other nationalities and, more than all, it has curtailed the freedom of American speech. It has concealed the Jew where he most wishes to be concealed, and it cannot be said that he has made the best use of this privilege.

It is this fixed policy of the B'nai B'rith's Anti-Defamation League which imperils the hope that the B'nai B'rith might have come to the front as one of the most useful influences in the solution of the Jewish Question. It includes a body of men sufficiently acquainted with the general point of view to be able to see where corrections and concessions are necessary as a ground, not to mere polite tolerance, but to reconciliation. There is no country in the world more propitious for the settlement of the world's Jewish Problem than is the United States, but it cannot be settled along the old line of the Judaization of the United States, nor by its de-Christianization either. The work of the Anti-Defamation League is positive to Judaization and negative to settlement.

Mass Meetings Well Staged

THERE is nothing that Jewry, acting through the B'nai B'rith, does so well as to hold Mass Meetings and attack "The Merchant of Venice."

Mass Meetings may be described as the Jews' great American pastime. The New York Kehillah, that is, The American Jewish Committee, can on one day's notice organize Mass Meetings in every city in the United States. They are mechanical devices, of course; they are not so much expressions of the Jewish mind as they are attempts to impress the non-Jewish mind. There is a great deal of theatrical calculation in them. This column could be filled with the dates and places of Mass Meetings held within any seven days on any question in which the Jews had decided to coerce or accelerate public or, as it usually is, official opinion. The Mass Meeting, it appears, can still be made to seem real to the political official whose vote is sought.

It was by Mass Meetings that Congress was coerced into breaking off our commercial treaty with Russia.

It was by Mass Meetings that the literacy test was defeated.

It was by Mass Meetings that every attempt to restrict immigration has been defeated.

In 100 important cities a Mass Meeting could be held tomorrow night if President Harding should attempt to remove a Jewish official, or if the census bureau should attempt to record Jews under their proper racial name.

It is a very perfect system, even if a little antiquated. Doubtless its main purpose is to let the Jewish masses believe that they too have something to say in Jewish affairs. Jewish leadership of the Jews is never quite what the Jews think it is, and its weakness was never more apparent than today. There has not been any "persecution" of the Jews in the United States and never will be any, but all that the Jews have had to carry in the way of misunderstanding has been the result of the leadership which has misled them into paths of bloated ambition, instead of substantial human achievement. At this moment there is trembling, not among the Jewish masses, but among their leaders. The Jewish people will presently take their own affairs in their own hands, and then their affairs will go better. There are too many "committees," too many "prophets," too many "wise men," who think that two minutes with a President constitutes greatness, and

that a busy bustling overseas and back constitutes statesmanship. The Jews have suffered from the personal ambitions and pathetic incapacity of some of their most advertised men.

The B'nai B'rith has this much in its favor: its leadership has always been progressive. Only when it has lent itself as local agent for the "leaders" of the New York Kehillah has it set up in its neighborhoods those influences which tend toward division instead of a better understanding.

Under whose inspiration it was that the B'nai B'rith undertook to bring its great power to bear against one of Shakespeare's plays, cannot now be said; but it has been most unfortunate for Jewish influence in all directions. Successful—oh, yes; but such a success as serious people could well do without.

Merely to glance over the record is interesting:

1907—Jews force "The Merchant of Venice" to be dropped from public schools in Galveston, Texas; Cleveland, Ohio; El Paso, Texas; Youngstown, Ohio.

1908—Jews have "The Merchant of Venice" eliminated from the English course in the high school at El Paso, Texas.

1910—Apparently the "Merchant" slipped back into Cleveland schools, for in April the superintendent of public schools issued an order that it was not to be used again.

1911—Rabbi Harry W. Ettleson and Solomon Elsner request the Hartford, Connecticut, school board to have "The Merchant of Venice" dropped from the reading list of the schools. The board complies.

1912—Jewish residents of Minneapolis, Minnesota, inaugurate a movement to have "The Merchant of Venice" dropped from the public schools.—In Boston, Massachusetts, the superintendent of schools refuses to withdraw "The Merchant of Venice" as a textbook, on the demand of Rabbi Phineas Israeli.

1916—On demand of Jews the New Haven, Connecticut, board of education votes to prevent the reading of "The Merchant of Venice," and extends the prohibition to "Lamb's Tales from Shakespeare" until an edition is published which omits the play.

And so on down the list of cities. A diversion was created by the Jewish attack on Sargent's painting entitled "The Synagogue" in the art scheme of the Boston Public Library. Many denunciatory resolutions were adopted throughout the country with regard to that, but the painting is still there.

The Jewish Idea of "Rights"

IT IS all part of one mistaken program, to prohibit free speech, with reference to the Jew. It is utterly at one side of all that American principles mean. Shut him up! Boycott him! Tear down his painting! Bar his words from the mails and public library!—what a waste of energy and what a self-judgment such an attitude is!

And it has become pretty general. Last Christmas most people had a hard time finding Christmas cards that indicated in any way that Christmas commemorated Someone's Birth. Easter they will have the same difficulty in finding Easter cards that contain any suggestion that Easter commemorates a certain event. There will be rabbits and eggs and spring flowers, but a hint of the Resurrection will be hard to find. Now, all this begins with the designers of the cards. And even in this business one comes upon that same policy of declaring Anti-Semitic everything that is Christian. If Rabbi Coffee says the New Testament is the most Anti-Semitic book ever written, what must be the judgment on an Easter card that is truly an Easter card?

In November, 1919, the Anti-Defamation Committee claimed that 150 American cities had excluded "The Merchant of Venice" from the public schools. The newspapers at this writing are announcing that David Warfield, the great Jewish actor, is going to play "Shylock" in the manner which, as he believes, represents the true Shakespeare conception. The Anti-Defamation League may yet find itself to have expended much energy beating the wind, especially as the best Shakespearean critics declare that "The Merchant of Venice" is not about a Jew at all, but about Usury as a vicious practice which gripped both Jew and non-Jew and brought division.

There was, however, a certain finesse in the manner of the Anti-Defamation League in approaching the matter of the exclusion of the "Merchant." It was not an incapacity to appreciate the fine work of Shakespeare. Oh, not, anything but that. Nor was it a confession of thin-skinned sensibility on the part of Jews. Not at all. No, it was really for the benefit of the Gentile children that the Anti-Defamation League wanted them kept away from that play in their reading lessons.

Here Are Their Reasons

HERE are excerpts from one of the letters sent out from the Anti-Defamation League in Chicago to the superintendent of public schools in an important city. The italics are ours:

> "We have just been advised that the . . . . *high schools* still retain "The Merchant of Venice" in the list of required readings . . . .
>
> "We do not base our request because of the embarrassment which may be caused to the Jewish students in class, nor is our attitude in this regard based on thin-skinned sensitiveness. It is the result of mature consideration and investigation. Our objection is made *because of its effect upon the non-Jewish children* who subconsciously will associate in their own minds the Jew as Shakespeare portrayed him with the Jew of today. Children are not analysts. A character in the past vividly portrayed exists for them in the present. The Jew of Shakespeare lives in the mind of the child as the Jew of New York, or the Jew of Chicago, or the Jew of Newark. Your teachers of literature might say much in favor of Shylock's good qualities, but our experience has been that only very seldom are Shylock's good qualities brought out strongly before children. Those traits of his character which are brought out most vividly in the study of the play are Shylock's greed, hatred, revenge and cruelty.
>
> "The fact that the College Entrance Requirements Board realized the justice of our stand and struck the play off from the list as required readings for entrance to our universities and colleges indicates clearly that it is a most serious problem . . . .
>
> ". . . . We believe that when you realize the great harm which might be caused to hundreds and thousands of law-abiding Jewish citizens of this country, you will grant our request that the reading of 'The Merchant of Venice' be discontinued from your schools."

To Do Away With Shakespeare?

AND in this case it was. Notwithstanding the fact that the play was used in the *high school,* and the argument of the letter was addressed to the effect of the play on *children,* it was discontinued. A study of the schedule of just what occurred showed that everything had been made ready even before the letter was written.

Does this frittering away of Jewish influence strike the Jewish leaders as a wise policy?

Is there any hope whatever of doing away with "The Merchant of Venice"?

Do they not know that it is the observation of teachers of literature that even if non-Jewish children are forbidden to read the play, Jewish children are going to read it anyway, since it is the Jewish children who must heartily enjoy it because they more clearly understand it?

Do not the Jewish leaders know that non-Jews do not read the "Merchant" for Shylock, except perhaps his noble defense of the Jew as a human being? Whoever hears Shylock quoted in anything but this, which numerous Jewish writers delight to quote?—

> "I am a Jew. Hath not a Jew eyes? Hath not a Jew hands, organs, dimensions, senses, affections, passions?"

To effect its purpose the Anti-Defamation League will have to perform an excision on our common English tongue. The wise and witty sayings of this Shakespearean play have passed into the permanent coinage of daily speech.

"I hold the world a stage where every man must play his part; and mine a sad one."

". . . . I am Sir Oracle,
And when I ope my lips let no dog bark!"

"If to do were as easy as to know what were good to do, chapels had been churches, and poor men's cottages princes' palaces."

"The Devil can cite Scripture for his purpose."

"A goodly apple rotten at the heart:
O, what a goodly outside falsehood hath!"

"Truth will come to sight; murder cannot be hid long."

"All that glitters is not gold."

"A harmless necessary cat."

"The quality of mercy is not strained,
It droppeth as the gentle rain from heaven
Upon the place beneath. It is twice blest:
It blesseth him that gives and him that takes.
. . . . . .
It is an attribute of God himself;
And earthly power doth then show likest God's,
When mercy seasons justice."

Their Course a Mistake

THIS is beyond the power of the Anti-Defamation League to destroy. Shylock may be forgotten, but not these living lines. It is true, however, that in 150 American cities, according to the league's claim, school children are prevented reading and hearing these words in school.

But is it worth it? Is it a part of "Jewish Rights" that an admittedly great play, taught in all the English courses of all the universities, should be prohibited to the children of the people in the public schools?

From the prohibition of the Bible to the prohibition of Shakespeare, the whole Jewish course has been a colossal mistake, the reaction from which will be to belittle Jewish public judgment in the future.

It was all very well said by a correspondent to the Newark *Evening News,* January 13, 1920:

> "To the Editor of the *News*:
>
> "Sir—Protests have been made by the representatives of the Jewish, Scotch and colored races against Shakespeare's being used in the public schools, the former because of the portrayal of Shylock in "The Merchant of Venice." Some Scotch folk have protested, as I understand it, to the Newark Board of Education, on account of the character given Macbeth. The colored folks, judging from the letter printed in the *News* from Washington, do not like the character Othello, owing to his despicable treatment of Desdemona. As a descendant of the Welsh race, I enter my protest in behalf of that ancient people in regard to Shakespeare's ridicule in Henry V, of the Welshman, Captain Ffluellen, who is made to look as if he did not know anything about war.
>
> "I have no doubt that others could find fault with Shakespeare's penchant for holding up the weak side of some of his characters, so I think that Shakespeare and the Bible might well be kept out of the public schools because both books are rough on certain people whose identity is clearly shown. The board of education is to be congratulated for taking action in the matter, which promises at this late date to place the Newark educational system in a class all by itself."

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

Now we have the editor of the *Jewish Sentinel,* of Chicago, telling us that an "Anti-Semite" is "an individual of low morality and intelligence who displays animosity toward the Jews." He goes on: "There was a time when we had the right to look upon an 'anti-Semite' as a man who dislikes the Jews and who would not associate with them. Today, however, we must look upon every 'Anti-Semite' as upon a murderer and criminal, because what the 'Anti-Semites' are out for today is to kill Jews." Can it be possible that this editor's readers have so little intelligence as to swallow propaganda of this sort?

The recently published reminiscences of Siegmund Mayer, the Austrian Jewish leader who died last October in his ninetieth year, throw much light on the development of Jewish influence in Austria and in Europe generally. When Mayer was a member of the Vienna city council he had an encounter with Carl Lueger, a colleague. Lueger said the Jews ought to go to Palestine. Mayer rejoined, "If the Jews are too much for you, you may go to Palestine!"

Sir Alfred Mond, prominent Zionist and commissioner of public works in Lloyd George's Government, announces that he has purchased a piece of land on the shores of the Sea of Galilee and will build a bungalow on it for his summer vacations.

According to a Vienna dispatch, the Austrian Government has instructed its Paris representatives, Eichoff and Tarnoczky, to take up with the League of Nations the question of the expulsion of several thousand Jewish refugees from Central European lands. Although leading Austrian Jews agree with the government that the presence of these invaders is seriously intensifying the food situation, wealthy American Jews are exercising influence against their return to Poland, Russia and the Ukraine, with the design of enabling them instead to emigrate to the United States.

The Paris press is much stirred up over alleged discoveries by the French secret police, *service de sureté,* that Dr. Max Nordau, Zionist leader, has been acting as go-between for the French communists in dealings with Krassin, the Bolshevist commissary.

Churchill, Mystery Man of English Politics

By W. P. CROZIER

Manchester, England, February—(By Mail).

SOME of the principal English and Scottish newspapers have just been holding a "model election" to test the system of proportional representation—P. R. as we call it here for short. There were fifteen candidates of all political sorts and sizes—party leaders like Asquith, Lloyd George and Bonar Law, independents of the type of Lord Robert Cecil. Labor men as far apart as Clynes, Smillie and Henderson, the popular "watchdog," Horatio Bottomley, and women like Lady Astor, the Unionist, and Margaret Bondfield, Labor.

There was also Mr. Winston Churchill. The voting was by post and over 35,000 voting papers were sent in. When the papers were examined and every candidate had credited to him the number of papers on which he received the voter's "first preference," it was found that Mr. Churchill had precisely 151. There was only one other candidate—who is in no sense a leading political figure—with so ludicrously small a poll. Now Mr. Churchill was minister of war and minister for the air when this vote took place and is now not only taking up the office of Secretary of State for the Colonies but is assuming responsibility for a vast new province which is to be brought under the colonial office—the Middle East, comprising Egypt and the mandatory territories of Mesopotamia and Palestine. How comes it, then, that a personality of this importance should receive a mere beggarly handful of votes from a very varied and intelligent newspaper electorate? Was there a mistake or do the figures really represent public opinion?

They do. Probably there is no political personality at the present day who is so generally unpopular and distrusted by so many separate sections of opinion. Mr. Churchill, an aristocrat, began by being a Conservative. He made his reputation by attacking his party from its own benches in the House of Commons. In this way he contributed to the downfall of Mr. Balfour's (Conservative) Government in 1905 and established his claim on the gratitude of the Liberal party. When the war came he was associated as first lord of the admiralty with that masterful man, Lord Fisher, and over the attack on the Dardanelles the two masterful men fell out and both of them resigned, so that the country was deprived of the services of the greatest seamen whom it has produced since Nelson's time.

Mr. Churchill was mainly responsible for the idea of the Antwerp and the Gallipoli expeditions, both of which failed disastrously. There are many nowadays who regard these schemes as brilliant strategic conceptions which, with better fortune, might have changed the face of the war, but there are many more people in England who regard them as wild projects forced by an imaginative civilian on long-suffering soldiers and who maintain that the diversion of forces to Gallipoli weakened the Western front and so prolonged the war. This section has never forgiven Mr. Churchill, and never will. He represents to them one of the most costly and disastrous failures in British history.

Then it is remembered against him that when Mr. Asquith found it impossible to admit him to the inner cabinet at one period of the war, he resigned and declared his intention of serving his country at the front. His reluctance to serve in a subordinate position brought a black mark against him in the country's books and another was added when it was found that after a comparatively short period of service at the front he was back again in politics. Let it be one thing or the other, people said, but to make these rapid changes argued a marked instability and capriciousness of character. Others again he has offended on the personal side by his habit of writing signed articles for the popular press on political questions. This is done more often in England nowadays than it used to be, but it is still done very rarely and there is a strong feeling against one of the most prominent ministers of the Crown writing (say) in an illustrated Sunday newspaper. The feeling may possibly be old-fashioned and no better than a prejudice, but it exists. It is characteristic that people cast about for some special explanation of so strange a phenomenon and found it in the knowledge that Mr. Churchill is by no means a wealthy man and would presumably be glad to receive the handsome fees which an affluent Sunday paper could afford to pay.

The critics who are offended with Mr. Churchill because of his resigning office, hurrying to the front and then returning to politics are, like those who resent his newspaper activities, drawn from all classes. Those who perpetually throw up against him the Antwerp and Gallipoli expeditions are mostly members of the Unionist party—especially the high-and-dry Tory element represented by the *Morning Post*—because Mr. Churchill was a Liberal minister and disliked not only for that reason but because he was a deserter from the Tory ranks. But since the armistice Mr. Churchill has succeeded very thoroughly in alienating both Liberals and Labor men. The hostility of Labor might be assumed, for the Labor party preserves its independence and is hostile to all ministers, Liberal or Unionist. But not to all of them equally and to none of them as much as to Mr. Churchill. The alienation of Liberals is much more serious, because at one time Mr. Churchill had a considerable hold on them as a sincere and eloquent defender of Free Trade. That hold he lost when it came to be believed that he was the chief driving force behind armed intervention in Russia and that he more than any other man was responsible for saddling this country with persistent participation in the war of the Russian Whites against the Bolsheviks.

Before we withdrew our active support of the Kolchaks and Denikins and other hopeless last-hopes of the Russian émigrés we had spent one hundred million pounds sterling. We had maintained for many months the miserable Archangel expedition, which was eventually abandoned because the country would simply not go on with it and the government was forced to yield. It has never been any secret that during all the last two years in which Mr. George has been struggling with painful and vacillating steps toward a peaceful settlement with Bolshevik Russia, Mr. Churchill has been opposed to him. He has made no secret himself of his bitter regret that England did not do more to assist the White Russian leaders. He has, of course, pleaded that whatever he did as war minister was done by him in execution of the policy decided on by the whole cabinet, and this was possibly true. But the country recognizes in him the strongest opponent of Mr. George's policy and the strongest advocate of a war of which it had become utterly weary.

England has come gradually to take the view which President Wilson recently expressed when he said that the Bolshevik domination was a monstrous tyranny over Russia but that it was not to be overthrown by foreign intervention, which could indeed but strengthen it. Mr. Churchill, like France, took a very different view. His view was not, however, based on a mere violent antipathy to Bolshevism as a revolutionary doctrine against which we must go crusading. He has always been afraid—and is probably still afraid—lest Bolshevik Russia should join hands with Germany. Against such a Bolshevik block, as he sees it, no state in Central and Eastern Europe could stand up. Hungary, Austria, the border states and Italy would all fall into the Bolshevik melting pot and Bolshevism would march triumphantly up to the River Rhine, thence to face and to menace France, England and in the last resort even the United States.

Mr. Churchill has vision, he has large ideas, he looks ahead, and few ministers do as much as that. It is easy to see how as soon as he became obsessed with this nightmare of a joint Russo-German Bolshevism, he sprang to the conclusion that the remedy was to suppress Bolshevism in Russia, the seat of infection, by armed force and to maintain in its place (presumably by armed forces, if necessary) some other form of government which would not only refuse to ally itself with German Bolshevism but would be actively hostile to it and help to keep it down. Now it would be foolish to deny that there was and still is something to be said for this fear that Germany might "go Bolshevik." But, even so, a foreign war against Russian Bolshevism is the last way to suppress it. All history has shown that foreign invasion rallies all parties in the country attacked to the side of the régime threatened. So it was in the time of the French Revolution and so it has been in Russia now. Mr. Churchill's reply would be that we did not make war on Russia with enough vigor and persistence, and the answer to that is the simple and conclusive one, as far as England is concerned, that if we had not stopped the Russian war there would have been revolt and revolution in this country.

(C) Press Ill. Service

WINSTON CHURCHILL and MRS. CHURCHILL

Mr. Churchill also failed to see that if Germany were to become a Bolshevist state, it would be because she had become wretched, starving and bankrupt. Bolshevism only succeeds where it finds the appropriate soil to root in, and that it finds in want and destitution. There is in Germany a very strong determination to resist Bolshevism and to prevent the country being dragged down into the abyss. What we say to Mr. Churchill therefore is that Russia should be left, as Mr. Wilson has urged, to work out her salvation free from foreign interference and that we should help Germany as far as is reasonably possible, to help herself; we should strengthen the anti-Bolshevik elements, the masses of millions of decent citizens who hate the idea of the Moscow terrorism and will not "go Bolshevik" themselves, except in passion and despair. Of course, there are some people who disagree with this argument, and approve of Mr. Churchill's views. But these are the very people who censure him most severely for his "wildcat schemes" during the war and distrust him because he is—or was—a Liberal.

So Mr. Churchill has come to lose the confidence of almost every section of public opinion here. The mystery is that he turns up none the less in every ministry that is formed and receives the most important offices under the Crown. Since 1906 he has been almost continuously in office. He has been under secretary for the Colonies, secretary for home affairs, minister of munitions, first lord of the admiralty, minister for war, minister for the air and is now minister for the Colonies, the Dominions and the Middle East in succession to Lord Milner. Liberals denounce him as a spendthrift and a militarist; Tories demand that their leaders should keep him out of the government as they kept out Lord Haldane. But all to no use. Mr. Churchill has many enemies and few followers, but he continues all the time to be one of our governors.

One reason is that Mr. Lloyd George finds in him a kindred spirit. Mr. Churchill is bold and adventurous and knows his own mind. During the war he was, like Mr. George, an "Easterner," hoping to avoid the interminable bloodshed in the West by finding some "way round" in the East. Mr. George prides himself on being a man who gets things done, who has decision and a driving will. So has Mr. Churchill and in respect of these qualities the two men shine brilliantly among the mediocrities who surround them in the ministry. Again, Mr. Churchill, like Mr. George, is accessible to new ideas. Everyone admitted that he was the right man to be at the head of the air ministry, where the alert and receptive mind was needed for the development of the new weapon. It was he who, when the war office stupidly and stubbornly frowned on the idea of the tank, took it up and pressed it forward, so that the British Army owes to him the saving of unnumbered lives.

A good judge has said that Mr. Churchill is the one man that our premier really fears as a possible rival and that this is the reason why he keeps him carefully in the ministry, despite his unpopularity, just as Italy became a member of the Triple Alliance because that was the only way of preventing her fighting with Austria. It may be so, for certainly Mr. Churchill would be a much more formidable enemy than any whom Mr. George has at present to face.

No one can forecast Mr. Churchill's future. He recently came into a fortune of £5,000 a year, which should make him independent of office if he should choose to quarrel with the premier. This makes him more formidable as an opponent than he ever was before. He has no strong root either in the country or in the Parliament and Mr. George has both. He inherited from his father the traditions of Tory democracy and the sacred cause of economy, but there are no signs that he cares for either of them much today. He has too much native ability, too high a quality of mind and will to be kept down and it is probable that his presence in the ministry is worth the price that Mr. George has to pay for it.

Truths and Mysteries in Farm Figures

By AARON HARDY ULM

This is the fourth of a series of articles by Mr. Ulm on farm life and farm management.

STUDIES made by farm economists in the United States Department of Agriculture indicate that the best earnings from the mere ownership of farm lands often, if not usually, come from the poorer instead of the good farms and are highest in what are rated as poor farm communities. This doesn't mean that a person purchasing agricultural lands for mere investment purpose should buy poor land in poor communities. It may mean that such a course is preferable, however, if direct rent return is the prime or sole consideration.

"Why do earnings in the form of rent from poor farms represent a higher return on the value of the property than those from good farms?" one of the department's chief land economists was asked.

"We don't know," he replied. "Many factors may enter into the cause but we hesitate about naming any of them. In fact, we are asking outside statisticians to help us find the answer."

The facts seem to be, as an illustration, somewhat as follows: If a landlord in, say, a first-class farming section of Iowa gets in rental as much as 3 per cent on the value of his farm property he does well. The rate of average rental return to such a landlord is more likely to be nearer 2 than 3 per cent. In New England the landlord is likely to receive more than 5 per cent on his investment. Yet farm lands in New England increase in value very little, as compared with farms of the Middle West. That very fact may be the reason—though the land economists are not ready to say so—for the higher rental earnings in the poor as against the fine farming regions. The big land investment earnings coming to the landlord in Iowa have consisted heretofore very largely of increase in the selling value of his property. Investigators estimate that farm lands sold in Iowa during the "land boom" of last year and the year before brought sales prices that represented, to the sellers, gains from increased selling value totaling the huge sum of $193,255,373. It is worth while noting that the largest proportion of those gains went to actual farmers, rather than to urban dwellers who were non-resident owners of farm lands. The investigators estimate that rural dwellers received a total of $102,425,348 in increased values from sales that are estimated as amounting to only 8.9 per cent of the farms in the state.

How far the American farmer as a landowner has been more of a speculator in land than a profit-maker from what the land actually produced is a difficult question. It is probable, however, that most farm fortunes go back more to increased values in land than to accumulations from mere cultivation of the soil.

The questions involved are quite important, for they affect the city person as much as the rural dweller. The higher the value of farm land, the higher the capital investment on which the farmer must earn a fair return, and thus the higher the prices at which he must sell his product.

For the farm operator can't safely measure his earnings by the difference between money or labor expended during the year and the cash received from the sale of his crops. In addition to earnings from his labor and that of his family and from his management of hired labor, he must earn on the capital represented by his plant. Otherwise capital won't go into farming, and there would be no material incentive for farmers becoming owners instead of tenants.

In fact, if we omit increment on land due to increase in its selling value—by no means a certain factor—a fair case could be made out in favor of tenancy against ownership. The figures actually show that the average tenant gets a higher return from his labor than does the average land-owning farm operator. That is one of the numerous oddities disclosed by farm economics, and shows that a good deal of moaning about the dangers from tenancy has been due to sentiment rather than sound thinking.

It is an economic fact, say the economists, that a certain amount of farm tenancy in our agricultural life is not only necessary but healthy. Where healthfulness ends and the contrary begins, no economist has been able to say. The line probably varies.

It is significant that every decennial census shows the greatest growth of tenancy in those sections where other returns show agriculture to be most progressive and prosperous. Increase in land values and increase in tenancy seem to be almost invariably concurrent phenomena.

Likewise the farm mortgage up to some unknown point is a sign of agricultural progress; beyond that point it is an unhealthy symptom. For the mortgage may mean better farm implements, a larger cultivated area and more progressive policies generally. No one knows just when the mortgage ceases to be a help and becomes an evil. But so long as it is incurred for constructive purpose, that is, for expansion in operations as against a means of living, it is nearer a good than a bad sign.

No farm beginner should be afraid of the tenancy and mortgage bugaboos. If there were no lands to be rented, there would be no chance for the farm beginner without capital. If there were no mortgages, expansion would often be slow. Fundamentally it is no more disgraceful for a farmer to mortgage his land than for a manufacturer to bond his factory. And viewed in some lights, it is often more economic to be a tenant than an owner.

"This bulletin contains ample evidence that the young farmer who has relatively little capital will find it to his best interests to become a tenant on a farm of considerable magnitude rather than to undertake the same type of farming on a much smaller farm which his capital will enable him to own," says Dr. W. J. Spillman in a document issued by the Department of Agriculture. The bulletin gives figures on the earnings of many farmers under varying conditions and shows that the tenant often makes more, especially on his labor, than the owner.

The department has made many studies of farm profits and farm earnings, and many of the figures produced could be made to show that farming, as a money-earning business, is a mighty poor calling.

Top—Farming, generally speaking, must be at least a family affair. In many respects it is also a community affair, and through the development of co-operative ideas it is becoming more so. This photograph shows families of farmers near Wilkesbarre, Pa., planting onions co-operatively. Center—A field of irrigated potatoes. Rubber-boot farming, as this kind is sometimes called, is the way to get big production. Bottom—What city man hasn't thought of starting a "poultry farm." Some get away with it, but no kind of specialized farming, say the experts, is to be recommended to beginners.

The profits, measured in dollars, have never averaged big, not even for the fat war years when prices of farm products were exceptionally high. While prices paid for farm products are quite uniform, that is, all farmers must sell at approximately the same prices, studies show that the cost of producing any particular product in any single year has wide variation as between communities and different farmers in the same communities.

In the studies of 842 records of cotton growing in several parts of the South, the department found that the net cost of producing a pound of cotton in 1918 varied from eight cents to $1.07 a pound. The average was 23 cents, which wasn't far below the average paid for the same cotton which was about 29 cents a pound. But almost as much cost more than cost less than 23 cents a pound to produce, the bulk of it, however, being produced at a cost of 28 cents or less. In Laurens County, Georgia, the production cost varied from 10 to 40 cents a pound and there were like variations in other countries where studies were made. The hours of man labor required for producing an acre of cotton varied from 91 to 131 in Marshall County, Alabama, and from 88 to 187 in Greene County, Georgia.

Cost studies made on 481 wheat farms with reference to the winter wheat crop of 1919 showed that production costs varied from $1 to $5 a bushel. The average was $2.15, which wasn't very far from what the farmers received for wheat at that time. And about as much cost more than less that amount.

But those figures don't tell the story of farm profits or losses—nor, it may be said, do any figures, for it is a subject that in the last analysis defies statistics.

The economists arrive at profits by deducting all expenses of the farm from the total income during a crop period. The total received by farmers for crops varies, chiefly in accordance with the extent of the farmers' operations, as do the expenses incurred in producing the crops. But after finding the net income, the balance left, if any, after all debts contracted for the production of the crop are cleared up, is divided between return on capital and labor income. For every operating farmer must have some capital investment, in live stock or implements, even though he owns no land. After the division is made, the final balance shows what the farmer has made from his own labor. Deductions are made usually for labor contributions by members of his family. It is probable that a true balance will show that the average farmer nets for an average year's work less than $500. In fact, the Department of Agriculture found more districts where his net labor income averaged under than where it averaged above $500. But that doesn't tell the melancholy story that might be drawn from the figures. For, as he goes along, the average farmer gets approximately two-thirds of his rent, food and fuel from the farm. These have, on the average, a farm value, for the districts that have been studied, of $500 to $600. And their city value, of course, would be much more. In addition, members of his family have been able to do earning work on the farm, which in the city they probably could not have done. And then, of course, there is the return, never estimated on a high percentage basis, from whatever capital investment he has in stock, implements or land.

There is some question whether there is such a thing as bankruptcy in farming as there is in general business, particularly small farming.

It is certain that "bad conditions" don't overload the bankruptcy courts with the financial troubles of farmers in anything like the volume that comes, in such times, from the industrial or commercial world.

You hear frequently of farmers as a class or sections of them being "bankrupt." But the word is used in a metaphorical rather than its business or legal sense; for if agriculture went truly bankrupt famine would probably result.

The average farmer is always able to get along somehow and without being greatly deprived of the necessaries of life because he has first call on a great many of the necessaries.

No studies have been made, so far as the writer could learn, of the well-being, as measured by possessions that give security to life and assurance against misfortune, between the run of city and country people.

While there is a greater display of some forms of wealth in cities and apparently a much larger proportion of city than of country people who are in position to procure the finer luxuries of life, the farms very probably present a higher average of material human well-being than do the cities.

I asked several agricultural investigators regarding that. Those asked agree with the statement made.

While the average farmer's net earnings at the end of the year are small, still they really are net earnings. Usually his so-called labor income means that he is at least that much further toward a competency than he was at the beginning of the year; for the larger part of his living expenses don't have to be deducted. The city man of course handles more real money but it is a question whether in the long run he accumulates a greater reserve against the well-known rainy day.

There is a good deal of misunderstanding also about the farmers' hours of toil as compared with the city man's. Undoubtedly the successful farmer works long hours and in bad seasons works under more uncomfortable conditions than do his city brethren.

The Department of Agriculture is now making some investigations that are expected to yield the truth regarding the "long hours" worked by farmers. They are having representative farmers in different sections keep daily diaries of their movements. Of course the actual time spent in working varies with the kind of farming, but those who have given thought to the subject estimate that the average American farmer puts in about 200 full working days a year. That is below the average for city people, but the days are longer and the work more arduous in the farmers' case. Besides, there is a measure of work, such as looking after his live stock and milking the cows, which the farmer must do every day, Sundays included.

"Living conditions in the country are not what they were a generation ago," says Secretary Meredith. "A lot of our notions about farm drudgery and hard living and isolation are ideas carried over from an earlier period when there were no electric lights, no bathtubs, no rural free delivery, no good roads to speak of, and when an automobile on the farm was as rare as an airplane today."

"Cutting Up Old Circus Money" II. Pioneer "Rolling Shows"

By HARRY BARNET

"'GOVERNOR,' what did a circus look like when you were a boy?" came the very natural question one afternoon after John F. Robinson had taken me through the animal houses, and the training or "ring" barn of the winter quarters of his show in the Little Miami country near Cincinnati.

It was the first question in an interview that began at early lunch in the $20,000 dining room of the family home at winter quarters. And, as a matter of passing information, the "Governor" is proud of that dining room.

"I paid as much for the furnishings in it," he said to me when we sat down at the table, "as I did for the first pair of giraffes I ever had with the show.

"But as far as the people who came to see my show were concerned," he continued, "I might just as well have saved the money that I spent for the beasts, and added it to what I paid for the things in this room. Then I would have had just that much more beautiful place to eat in.

"You know, giraffes are so delicate that hauling them around with a circus is a dangerous thing to do, even under the best of conditions. And this was before I put the show on railroads, and when we had an awful time getting the wagons across the country.

"So, I was awful proud of my giraffes. No other show had a pair of them. I used to stand around the menagerie to hear what people had to say about them after they looked at the pair. You can imagine my disappointment when all through the season the crowds would just glance at the giraffes, and crowd around the monkeys to look at them—and monkeys were the cheapest things that I could exhibit in the menagerie."

There was little need to ask questions to keep conversation alive on this afternoon. The "Governor" was born in the early 40's, three hours after his mother rode her horse in the ring of his father's circus. For seventy years he was a performer and a circus owner, taking up the management of the circus where his father laid it down, and building the enterprise into one of the largest tent shows in the world during its heyday. In turn he was succeeded by his son as proprietor of the caravans. A short time ago the show was sold, and the winter quarters are deserted by the Clans of the White Tops and their strange animal companions. The unmistakable odor of menagerie animals, however, still hovers about their former cold weather home.

When he built this housing place for his show, the "Governor" did the job to meet requirements that few other men knew about, and could anticipate. There are shops galore for the building of dens, wagons, and even railroad cars; and animal houses that give something of their natural environment for the animals they were intended to shelter during the winter; ravines and little plateaus for the hardier animals to roam over; level sandy fields for camel herds, and little forests for the elephants. When we wandered through this maze of wonderland, each nook and corner of it suggested to him a story of the White Tops, and of the dazzling gold and mirrored and multi-colored wagons that these buildings had received beneath their friendly roofs.

He told these stories in a string that set delineation heel-trodding upon recital. Under the spell of my environment, and of the unbroken scud of narration across it, a bespangled genie seemed to have caught me up clear of the Little Miami country, and to have set me down in the pages of some unhackneyed Arabian Nights, where characters peered alluringly through rifts in paper-covered hoops, only to disappear, and presently again to come into sight, cutting unheard of didoes upon the backs of beautiful four-legged creatures.

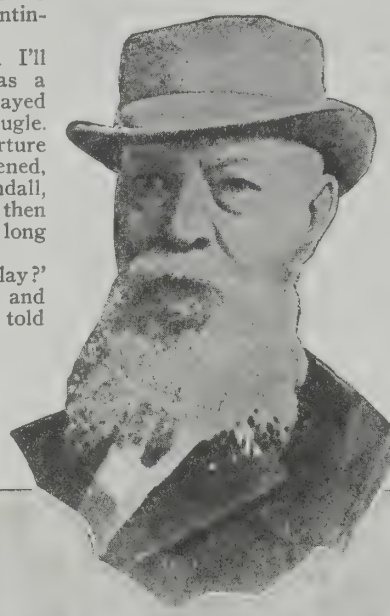
It was not until we returned to our chairs on the shady lawn beside the house that I began to lose the sensation of being afloat upon a magic carpet. Then it occurred to me that of all the things he said there was no word about the appearance of the tent show in the days when he first knew it. Hence the question.

"Well," the "Governor" replied, "there isn't much to tell you about it. There was only one tent, and that was a seventy-five-foot round top, with sidewalls that were only about nine feet high. There was no marquee in front of it where the crowds entered; they went into the tent through an opening in the side wall. The seats were only seven tiers high.

"And for a good many years there was no menagerie tent," he continued. "The seats didn't run all around the inside of the tent; and we had only one ring. After pa got an elephant, and a few other animals in dens, they were lined up alongside of the ring where there were no seats.

"Do you know," and here the "Governor" turned to me, and shook his finger in emphasis of each word that he uttered, "I'd like to see one of those old-fashion circuses again. Maybe I'd be disappointed, though, because a man's likely to look backward on his childhood days with glasses that exaggerate happiness. But there were intermissions between the acts, and then the audience watched the animals from where they sat, because it wasn't very far from the seats across to the dens. The restless motions and roaring of the beasts during the performance always seemed to me to blend in just right with what was going on. And I was sorry when we put up another tent for the menagerie.

We were the first circus to do it, and it was done for the first time in Atlanta, Georgia.



"Of course," he went on, " a tent of that size didn't take up much room, and we usually showed on a lot that was right in the heart of the little communities we visited—and mostly we showed in the barnyards of the taverns. There were no parades. There was no band with the show for a good many years after I was old enough to remember things about it. Pa had a fiddler, who sat with his back to the center pole, and played alone. Then pa got a grind organ, and had a canvasman turn it during the performance.

"And I was a good-size boy before he felt that he could afford a band. When he did, he went to New York and brought back six musicians. That band was his pride, and he used to stand around them as much as he could while they were playing. There was one thing about the band, however, that worried him a lot. Once in a while one of the musicians quit playing while the others continued.

"The first time it happened I'll never forget. Ned Kendall was a member of the band, and he played an old-fashion copper-keyed bugle. The band was playing an overture just after the doors were opened, and pa was standing beside Kendall, who played a few bars, and then quit. He remained quiet for a long time, and pa got uneasy.

" 'Why don't you go on and play?' pa finally blurted out. 'Go on and play.' 'I can't play,' Kendall told him, 'because I've got thirty bars rest.'

" 'Rest nothing,' pa yelled at him, 'I hired you to play, not to rest. You can rest all you want to after the show is over.' But even after we got the band there were no parades for a long time. Just before the show got into a town the band wagon was stopped, the horses hitched to it, and to all the other wagons, were plumed; the musicians put on their uniforms, and the show came into town with the band playing a lively tune.

Above—JOHN ROBINSON, the first founder of the circus, a hundred years ago. Reproduced from a very rare picture. Below—Typical show day crowd in a small southern town.

"The advertising for a good many years was extremely simple," the "Governor" went on, "but it was effective. The amount of paper that we use nowadays on one small stand would have lasted the show then for an entire season. There was no pasting, and there were no billboards for years after I knew much about things. Pa had a man he sent ahead of the show on an old mule. He put enough paper for six weeks' billing into the saddlebags, and he was allowed six boxes of tacks to the lot—one box of tacks to a week. The bills were tacked on barns and trees.

"And pa always went around when the show got into these places to see how good a job the advance man did. There was one thing he always insisted on, that the name of the town and the date be in big type. He kept this up after we commenced to use paper with pictures on it.

"Years after these early days, we started to use a twenty-four-sheet poster, showing the interior of a circus, and an awful big crowd watching the performance. There was everything you can imagine going on in the picture of the ring. The first town we got into where this paper was used we had a slim crowd at the afternoon show. After it was over, pa walked up town to see how much paper had been used there. On his way he stopped to watch three or four men who were intently examining that stand of paper, and talking about the things on it that they had seen, and the things they had not seen in the show that afternoon.

" 'Now,' one of them said, 'I seen that, and I didn't see that there.'

" 'I didn't see that neither,' another one said.

"Finally, they came to the conclusion that the show was so big—although it only had one ring, and no menagerie tent—that they had missed a good many of the things pictured on the poster. Just as they were leaving the poster pa walked over to them.

" 'No,' he said to them, and pointed to the picture of the enormous crowd, 'and I didn't see that big crowd there, either.'

"But the most curious paper we ever used for the show was for the Chinese section of San Francisco," the "Governor" went on, his recollection nimbly leaping over nearly two score of years.

"We were the first circus to go to California and back in the same season; theretofore, circuses went there in one season, and came back the next year. The first time we showed in San Francisco we stayed a week, and I found out then that the Chinese are as fond of a circus as any small boy you ever knew. I think every Chinaman in that country came to the first performance, and came back to see every other performance we gave while we were there.

"The next season we went to San Francisco I went ahead of the show. One night the editor of the Chinese newspaper—I think it was the Sai Gai Yat Bo—called on me. He wanted an advertisement, and he got it. Then he wanted to print for me some posters, and I let him do that.

"The paper he got out for me was splendid. It was printed on brilliant yellow sheets of paper, in black Chinese characters. There were pictures on it of elephants walking on stilts; a mastodon on a rampage; the 'Human Catapult'—a man being fired across the canvas out of an enormous spring gun; and enormous pigs and cows. Scattered here and there on the paper were pictures of bareback riders, twisted on their horses like the letter 'S,' and a herd of giraffes running at top speed. I think I paid two or three hundred dollars for the printing, and the paper was put up all over the Chinese district.

"Well, when the show came in, I expected to see the same great crowds of Chinese that I had had the season before, but we showed there for a week, and I don't think I saw a Chinaman under the tents. That made me a little curious, and I began to investigate.

"I found that the year before my elephant man had gone on a crazy drunk one night, and got the fever on him of 'damn the Chinaman.' He jumped into a crowd of them over near the horse tents, and grabbed a Chinaman with an extraordinarily long queue. He cut it off with his knife before all the rest of them. The Chinese simply boycotted my show the next season. And the news must have spread all over the United States. That happened in 1892, and for as many years after that as I ran the show I don't think I ever saw more than a dozen Chinamen all told under my canvas, although before that they attended in every city we visited.

"I've often wondered when I watched the crowds come on the show lot," the "Governor" said, his mind again reverting to boyhood, "whether any one in the crowd had an idea of the evil ancestry of the circus, and how pa took it out of the mountebank class, and made it a respectable thing to attend.

"Of course, there was the Roman circus," he continued, "but it wasn't the ancestor of the American circus. Our tent shows came from English fairs that were in vogue about the time that the Virginia colonies were being settled.

"These fairs were nothing like our own. They were drinking bouts, and wrestling contests, with bull-baiting and animal fights on the side. But these customs were imported and kept alive in this country by the frolics they had in the South before parades on show days for years after I was a grown man. It took a long time there to separate the circus from any hint of these fairs in the minds of the people. The merchants in the towns used to get up animal fights—bears and dogs; wildcats and dogs; two tom cats, or any other kind of an animal that would fight, and do it savagely—as a free attraction to the country people before the circus parade. The fights attracted them into town early on show day, and they did a lot of spending before they came on the show lot.

"The last time that I saw a show day animal fight was in Valdosta, Georgia, a good many years ago; the practice then was dying out. It was to be a bear and a dog fight in the back yard of a saloon. In this yard was a shed. People coming into town to do their shopping used to stable their teams in it to keep them out of the weather.

"By the time the fight was to start that morning the roof of the shed was loaded with people. A big black bear was tied in the middle of the yard, and about thirty dogs were turned loose in the yard with him. Just as the dogs came yelping toward the bear the roof of the shed fell, and the people on it went down on top of about forty horses. The bear and dog fight was forgotten.

"Fortunately, nobody was badly hurt. But during the excitement the bear managed to slip his collar. Like all buildings in that country, the bar room was set up on posts, which raised the floor about two feet above

the ground. Mr. Bear made one dive under the floor, and the dogs followed him. They fought under there for a quite a while, but it was no satisfaction for the crowd—they couldn't see the skirmish. After a little while of hearing nothing but squeals and grunts the dogs were called off.

"When the bear found he was free, instead of coming back into the yard he made a break into the street, and the dogs took after him. They went down the street like a lot of scared rabbits, and the bear started to climb a tree. When he got about half way up a big dog made a jump and a snap, and got a good hold on the bear's tail. That settled it. The dog held on. The bear couldn't go up, and he didn't want to come down. Finally, he dropped square on the dog. But there was no more fight in that bear; he knew he was whipped, and he walked right back to his box, where he knew he was safe. The dogs solemnly fell into single file behind him, and they made quite a procession down the street to the saloon.

"Then we made our parade, and the crowd followed it back to the lot, where we gave our free show, of a high dive for life, and the doors were opened.

"Some time around the close of the eighteenth century the English became ashamed of the manner in which their fairs were being conducted, and Parliament undertook to do away with them. In the place of these fairs more substantial attractions began to develop. They were specialized into menageries and exhibitions. They were stationary, and they were as much theaters as they were circuses. The stages were enormous, and at the close of the acting performance, acrobats and trained animals were brought in; pony races closed the performances.

"Of course, this class of amusements was imported into America, but it did not flourish here. Pa tried it out in New Orleans before he started our circus, and it was the only financial failure he ever made. Between 1800 and 1860 most of the population of the United States was in the country. Communities were far apart, and the only salvation for showmen was to put their shows on wheels and take them to the people. That was the beginning of the American circus, and it grew into an institution utterly different from any the world ever saw.

"The first of these shows were called 'rolling shows,' and they were extremely primitive. None of them traveled very far from the Eastern Coast. When they started out at the beginning of the season, they had hopes of crossing the mountains, and getting into new territory, but when they came to the mountains in Pennsylvania, they turned back; they had troubles enough where they were, and they stopped before they ventured into the midst of new ones. Pa brought the first rolling show into the Middle West.

"He did it, because there was a lot of fanaticism and ignorance to buck against in the coast country of the East; people there still associated the circus with the old fairs of England. Various states passed stringent laws, culminating in 1832, in the passage of an act by the legislature of Connecticut fixing the license for the bigger shows at $1,000 a day. That hit pa's show, for he had eight wagons, and thirty-five horses, and it was one of the biggest shows then in America. A thousand dollars represented the gross receipts for several weeks.

"These laws drove pa into the Southern Territory. He developed it, and we practically ruled the South as far as circuses were concerned for a couple of generations. Pa had a trademark, 'southern men, southern women, and southern horses against the world.' I was old enough to be a performer when he took the first circus into Florida and into Texas.

"But when he got ready to do it, pa broke the Connecticut law to bits. At the same time he took the circus out of the evil class that other people had placed it in, and started it on the road to being considered respectable.

"In 1852, he wanted to go into the state of Connecticut. We had been down in Florida, and worked our way North along the coast. The people of Connecticut were circus hungry, but there was that law around the state like a high rail fence. Pa went before the legislature, but it refused to repeal the law. The members of the legislature thought that the sight of a woman in tights was an awful thing; but after pa promised that the women of his show should wear long skirts when they rode, and the men would wear puffed and frilled shirts and knee breeches, the legislature reduced the license to a decent figure for him and we entered the state.

"That season the feature of the parade was a twenty-horse team. Each one of the horses was a matched cream in color, and had a white mane and tail.

"We also carried the spectacular play of 'Cinderella.' It was rendered by the children with the show, and was done on a grand scale. I was about nine years old then, and my cousin was about the same age. You know in the play the witch comes into the kitchen and asks Cinderella for something to eat just before she turns the pumpkin into a chariot.

"Well, every night the property man had an awful time trying to have something for Cinderella to give her. He would get a loaf of bread for the witch, and when it came out of the ring he would try to save it for the next night, but we boys used to lay for that bread, and it never touched the ground before we had it. We weren't hungry, but we just wanted to be doing something.

"One time the property man managed to hold on to the bread for four nights, and it got so hard and dry that nobody wanted to eat it. Then he got a little careless with it. That was our chance. There was a little creek outside the dressing tent, and I grabbed the loaf of bread, and threw it into the water. When it came time to give the bread to the witch there was none to give her. There was no time to delay, either.

"The candy butcher came along just then with a basket of gingerbread. The property man grabbed a big chunk of it from the basket, and ran into the ring and handed it to Cinderella. After that part of the show was over we boys thought we had struck it rich. Gingerbread! We stole it, and thought we had something soft for the rest of the season if we worked it right.

"Next night we were waiting to get the gingerbread, when we discovered that the property man had provided pound cake. We could hardly wait for the witch to get through looking at it. When it came out we grabbed it, and took two or three mouthfuls. It was yellow corn meal bread made to look like pound cake. Ugh!

"But our venture into the state paid. The show did an enormous business. In Hartford we showed on the city commons, and had to give four performances the first day to accommodate the crowds. The menagerie pulled the most of them, because it offered an excuse to those people whose moral scruples were most strict to see the Biblical creatures in real life. You know, in those days we advertised the menagerie animals as 'Biblical creatures,' and I never thought we were far wrong in doing it.

"From that time on circuses no longer were considered an aggregation of vagabonds."

This is the second of several articles by Mr. Barnet, on early circus life in America. Another will appear in an early issue.

Top—A carnivora house, showing a wheeled winter cage, where the beasts of the menagerie pass their winters.

Center—Chair and table highly prized by the "Governor," and occupying a place in his dining room. They were carved by the "Governor's" daughter. The bird and animal heads are wood sculptures from beasts in the circus managerie.

Bottom—The "ring barn" where most of the nation's celebrated circus performers kept themselves in condition, and worked up new acts. The "mechanician," shown here, is a long pole equipped with ropes and pulleys. Riders attach the end of a rope to their waists when they are practicing new acts, and the other end to the pole. It revolves about the ring as they ride, and if they slip from their horses they are left hanging in the air until the horses come beneath them again.

Dolls Date Back 4,000 Years

AN IMPORTER of toys, doubtless with an eye to publicity, recently remarked that dolls were coming "in" again. An American manufacturer promptly replied to this that at no time, in war or peace, had dolls been "out"; and that the only dolls coming "in" were a few meager samples that could not hope to compete with the established doll industry of the United States.

Be that as it may every doll has its day, and every day has had its doll. It is an old saying that the child is mother to the doll; but it is true that explorers find the doll-instinct almost everywhere they go; and records of past ages indicate that wherever the human instinct existed, it was echoed in doll-love.

At times dolls have exceeded their sphere among children and have been appropriated by grown-ups. During the fourteenth century it became the custom to use dolls as mannequins on which were displayed miniature gowns or costumes of the latest style. This practice still exists in France, though the elegantly-attired wax dolls of today are more often the puppets of society ladies than the useful equipment of the dressmaker. Often the doll has been able to combine utility with other purposes. For example, our forefathers—being great masters of magic—were able to insure the speedy death of a rival by sticking black pins into a wax figure of the enemy. Dolls in Mexico were used in religious rites, after which they returned to their proper function of affording amusement for the children.

A very primitive doll can be found in Russia; it is the moss doll and effectively expresses the poverty and loneliness of Russia's great forest regions. It is roughly fashioned of wood, with a face of pathetic sadness, and dressed in hood and clothes of forest moss. The male doll is distinguished from the female only by the hatchet which he carries! Among primitive dolls are those cut from chips of wood and gaily painted in the colors of the Russian opera.

In the Congo a baby's "buggy" is the mother's back, to which the infant is strapped. The dollies of the youthful cannibals conform to type, and are simple sticks of wood, wrapped and tied on the child's back with rags. Korean girls use similar sticks of bamboo, but art is added to utility and elaborate coiffures are arranged with plaited grass. A doll of such superb allurements neglects none of the arts of the toilet, for its face is carefully powdered by the little mother—though no face exists.

Ostrich bones are the material for many of the old Peruvian dolls, and sex is always distinguished, for the male wears a blanket while the female is clothed in a petticoat.

Dolls have been dated as far back as 4,000 years ago, and dolls of "civilized" character, too. The doll was an important individual in the life of the Egyptian child; the doll was varied and amusing in forms, and was mummified like any other respectable person. Will the Teddy Bear live as long as the Egyptian doll, which, carefully formed of wood, beautifully painted, adorned with lucky emblems, and with hair made of Nile mud beads strung on strings, still rests in museums?

Abyssinian dolls still use that method of representing hair, although in a more elaborate manner. The dolls often have movable joints, worked by strings. Many are of modelled bronze, or earthenware, and clearly show a Greek influence similar to that seen in Egyptian pottery and portraits on mummy cases.

In the far North is found one of the best examples of civilized dolls. The toy of the Alaskan child is a superb little model of Eskimo life. The doll is beautifully dressed in sealskin, and may be the predecessor of the Teddy Bear.

Not only do dolls portray the costumes and physical characteristics of their day, but also they often reflect mental traits and social habits. As the Boeotians were regarded in ancient Greece as the most stupid of human beings, so the Greek comic doll was an imitation of the blank-faced Boeotian. Among Mohammedan peoples dolls are regarded as graven images and as such their use is forbidden. But the Mohammedan girl will not be deprived of her human rights, and overcomes the religious obstacle by having a doll without a face.

The population of India today represents a fusion of two peoples—the light-skinned of Persian origin, and the dark-skinned aborigines. With the general exception of South India, where the conquerors from the Asiatic mainland did not so freely intermingle, the higher castes are as a rule lighter in complexion than the lower castes. This difference is carried over into the manufacture of dolls. A beautiful toy of Indian make shows a fair rajah seated in a gorgeous howdah on the back of an elephant but the mahut who sits back of the elephant's ears is almost black. Also, Negro children naturally love best the pickaninny doll, and look on a white doll as something abnormal.

It is a long road from the flint doll of the Congo to Edison's wonderful phonograph doll, but its kingdom is the same, and is everlasting, the heart of the child.

The Crime of the Cities—Boston

By FRED C. GREEN

STATISTICS compiled by Federal officials in charge of prosecuting prohibition violations in Boston indicate that eighty-five per cent of such offenders are not native-born Americans. Of the foreign groups Jews and Italians predominate, with Jews ahead of all others.

These statistics apply not only to Massachusetts but to Rhode Island and Connecticut as well.

More Jews are arrested for "bootlegging"—peddling liquor by the pint or quart from suit cases, rag-bags, and so on, than people of any other nationality; where enforcement officers raid places in which stills of magnitude are being operated it is generally a Jew who is either in actual charge of the plant or is back of it. Plots that have come to light which involve large shipments of contraband from across the Canadian border are, in the majority of cases, backed by Jews.

This applies to the smuggling of whisky and other liquors in freight cars, where the bottles or cases are camouflaged in sacks of potatoes, bales of hay, bales of rags or other merchandise. Recently two entire freight cars, filled with liquor that was billed as scrap leather and wool waste, were shipped from Montreal and seized in this vicinity. Two Jews, members of a Montreal firm, were arrested in Boston for their alleged part in this smuggling.

The Volstead Act provides only a fine for first offenses. Such a fine is regarded as a part of the overhead expense of carrying on an exceedingly lucrative business. The only thing that frightens such offenders is the possibility of a prison sentence, and in many cases they get around this by giving a fictitious name if they are arrested a second time.

These foreigners are not of the "second generation" variety. The majority of them have been in this country seven or eight years. Many of them come from countries where graft and bribery are prevalent and these, as soon as they come under the ban of the law, attempt to bribe the representatives of the government.

Although prohibition enforcement has thrown an enormous load on the Federal courts the work of prosecuting such cases has not been blocked and there is no confusion, unless it is the slight amount due to the necessary duplication of work under the present system.

The United States commissioner, whose office corresponds to that of a lower court judge, has no power to impose a penalty. He hears evidence in preliminary hearings and if he does not find the offender guiltless may order him held to await the action of the Federal grand jury or else to go before the United States district court.

In either of the last two findings it is necessary to submit the evidence a second time, thus making two bites of a cherry. Unless conspiracy is involved, first-time prohibition offenses are misdemeanors. There is a movement now on foot to give added power to the commissioners in order to enable the Federal lower court to dispose of as many such cases as possible.

For second offences jail terms may be imposed. In Boston, at present, the prosecutors are going through their files, sorting out a list of the worst offenders, to whom heavy fines or jail sentences are to be meted out, in an effort to set a warning example.

The prosecution here is directed by Herbert A. Horgan, who has been made a special assistant to the Attorney-General. He was formerly legal advisor to Prohibition Enforcement Agent McCarthy. Special assistant United States district attorneys are also to be appointed. During the war Mr. Horgan was connected with the Army Intelligence Department as the head of a bureau at Washington to investigate disloyalty among foreign-born citizens. This work gave him an unusually good insight into the foreign mind and he has an interesting suggestion as to how prohibition violations among our foreign element may be cut down.

He believes that if the foreign-language press of the country would take the matter up and propound to its readers, in their native tongue, just what the law means and what violations of it may incur in the way of penalties, including the loss of citizenship if the second papers have not been taken out at the time the offense is committed, it would do much good. This idea could be carried out, also, from the pulpits of the foreign churches and through other media that would reach those who do not read American newspapers.

"Bootlegging" on a small scale and the operation of small stills are found to a greater degree in our industrial centers where foreign colonies are established.

But the big "rum-running" projects, operated by organized gangs and in a systematic way, through chains of cities and towns from the source of supply to the distributing point, are backed by large capital and in the majority of cases Jewish brains are responsible.

The writer was shown the file in the office of the prosecuting officials and the cards therein bear out the statement as to who leads in violating the law.

(C) Gilliams Service

MISS BERTHA MAY GRAF

Before the National Woman's Party dissolved at its recent convention in Washington, an unofficial vote was taken by the delegates as to the prettiest girl worker among them. Miss Bertha May Graf, of the Suffrage Headquarters, won. In recognition of her beauty, Miss Graf acted as flower girl at the convention. This is her latest photograph.

The Builders

By FRANK DORRANCE HOPLEY

THERE is a fable of a man who thought to build himself a castle that should stand as a monument to his memory forever.

He builded one whose corner stone was riches. It was inlaid with gems and had a golden cornice, which glittered in the sun. "This castle will stand forever," said the man, but the winds of misfortune blew upon the four corners, and it fell.

Then the man builded again—this time upon power. He thought himself invincible with his bulwarked towers and strong embattlements. But there arose a mightier than he, who assailed the castle from all sides, and it too fell.

For the third time the man builded, and the foundation was fame. His sayings and deeds were heralded throughout the land, and he raised the structure to the plaudits of the multitude. But the people were fickle and before a year had passed they had followed after another, and the third castle began to crumble.

Again the man would have builded a castle, but the times were hard, and there were many poor and desolate in the land who needed assistance. So the man put aside his ambitions to raise a monument with his name upon it, and gave of his abundance, and helped to make life less hard and wearisome for many people, in consequence of which he could not build, this time, a castle, but had to be content to erect a modest house upon the hillside. There he lived through all the storms of life, and the house still stands, a monument to the man, because it was built on sacrifice and love.

There are many persons today who are like the man in the fable. Some believe that wealth is all in the world that counts. Others there are whose god is power. And those who chase the will-o-the-wisp of fame are oft-times doomed to disappointment. The multitude that applauds them today will, tomorrow, applaud others with equal acclaim. The goddess of fame is a fickle jade and will not stay won for long.

But the man who builds upon the corner stone of love and sacrifice for his fellow men, who thinks of the happiness of others before his own, is certain that his name will be remembered and revered after he has passed away, and many will rise up to call him blessed.

Warren Harding, the Man

Concluded from page 3

only thing is to minimize their seriousness or bitterness. As for will, those who have seen, as I have, Mr. Harding in the attitude of having made up his mind cannot doubt that he has an inexhaustible amount. It is implied will, however, and as such not likely to provoke clashes.

To describe him in a few words, the President is a man after one's own heart. That goes for the men as well as the women.

Reports are already current in Washington as to what the Harding White House-ship will mean. Reference has been frequent to the manner of the Roosevelts, who left many an aching social heart because beneath the so-called "bully" policy there existed an inner circle, a sort of sacred sanctum achievable only by those of unquestionable aristocracy; the Tafts were annoyed by petty enmities incurred during their Cabinet days; and the Wilsons, of course, observed a policy of their own making, but in which resident Washington has never figured. The Hardings may be depended upon to set up their own standard, a medium between exclusive and popular—a clearing house of current thought, a meeting place for the "best minds," as the President calls them, be they masculine or feminine.

At the time of writing the first rumbles of dissatisfaction were heard at Washington that President Harding was not going to be hasty in putting Republicans into office. In this regard his intentions have once more been misconstrued by machine politicians. The fact is that he stands committed to a thorough house cleaning, and his criticism of overstaffed and extravagant government departments were keen enough, but on the other hand he is too good a business man to disturb the business of running the government—for he is going to regard it as a business, just as printing the *Marion Star* is—by unnecessarily turning out incumbents before capable successors have been selected.

There is no denying that the government departments and routine work on March 4, 1921, were thoroughly disorganized and erratic, despite a few feeble attempts at political somersaults by a few Democrats who think they can conceal their politics (not their lack of ability) long enough to be permitted to retain their work. Their disappointment is going to be great.

President Harding believes in the proverbial new broom, but likewise is not forgetful that a new broom is inclined to be rough and roughness does some damage.

I quote from an interview I had with him in the spring of 1916—the first interview of national scope ever sought of him.

"We want a real and righteous Americanism abroad, and we need a newly consecrated Americanism at home. That's why I am a Republican. We must have a slogan of prosperity and we should make America prosper first.

"The war has given us a fictitious, sectional prosperity, but it does not blind us to the depression likely to follow, nor to the industrial reconstruction which must be worked out after peace is restored."

The man who could foresee this situation five years before it oppressed the United States is logically the man to restore normalcy.

The Thirtieth President?

Concluded from page 3

"Maybe not," the other replied sharply, "but it won't empty it!"

It doesn't matter much if one doesn't hear Calvin Coolidge speak; one may understand him just the same, and if he wants to reach you with his mind he will find a way. He is an excellent writer and his compositions reveal a literary quality that is rare in official papers. And he himself believes that the people do not want to hear words.

He ought to know by now. He has been seventeen times a candidate, I believe, and each time has won the race for office.

Vice President Marshall, also a taciturn man, but of different character, occasionally entertained the Senate and the country too with some humorous quip, even at the risk of becoming unpopular, as was the case when he compared the Senate to a balloon, but wit from the Chair will be awaited in vain—unless Vice President Coolidge, president of the Senate, should change his mind.

That is unthinkable, at least now, because it does not come within the province of progressive government, which is his one hobby by way of life work. Even though witticisms from the Chair might help to relieve occasionally monotonous proceedings in the august Chamber it is quite likely that he will expect Senators to provide their own wit and he will provide, if need be—as to this I cannot commit myself—the laughter.

One thing is sure—that he will be as stern a presiding officer as his predecessor.

Vice President Marshall, a few days before leaving office, had this to say:

"Is it not possible for the occupants of the galleries to obey the rules of the Senate? You are not all strangers. I see you here frequently. It imposes a burden upon the presiding officer that you ought not to put upon his shoulders all the time to call you to order. You have no right, under the rules of the Senate, to manifest your approval or disapproval. As good American citizens, will you not be kind enough to obey the law of the Senate as well as every other law of the Republic?"

This is a typical reproach, couched in the most convincing and pleasing terms, but I can imagine Vice President Coolidge uttering the same sentiment and order if not the same words—and from him it will seem just a little more forbidding.

But I can also see, in my mind's eye, Vice President Coolidge at home, embracing his two sons, John and Calvin, while mentally chuckling over absurd rules that require the Senate to provide its own applause.

Many Men of Many Minds

H. S. Firestone.—A man who isn't willing to share his success with others won't have much success to put in his own pockets.

John D. Rockefeller, Jr.—My experience proves that the only things that come to the man who waits are the cast-off things of somebody else.

Dr. Herbert Johnson.—The American girl of today is truer, braver and finer than those who have only watched her when frivoling at home can believe.

Hudson Maxim.—Capital is a reservoir where industrial energy is stored for use. Money exactly represents everything that can be bought with it and done with it.

Wesley L. Jones.—We should have men on the Shipping Board who know the shipping business, who can meet those dealing with the board on their own ground, and who can anticipate the moves of our competitors.

Samuel Insull.—The men I know who have gone ahead fastest have been just normal fellows. They were set off from the others, in the beginning, only by the fact that they made a practice of using the constructive little opportunities which others have neglected. And that practice gave them the special abilities they needed.

Irvin S. Cobb.—Pestilence we may guard against; famine we may alleviate; wars perhaps some day we may prevent; but against the criminal recklessness of the individual thoughtlessly endangering his own safety or the safety of some innocent victim, the world, until lately, had neither adequate protection nor sought for any.

John D. Ryan.—Influence is the worst handicap any young man can have. It tends to make him feel he need not exert himself to his full capacity and has a bad effect upon him. When other workmen learn that one of their number has a pull with somebody higher up, they look at him askance and the effect upon these other men is bad.

Herbert S. Bigelow.—The power to hire and fire is a power which no man should be trusted to exercise over another without restraint.

President Warren G. Harding.—I decline to recognize any conflict of interest among the participants in industry. The destruction of one is the ruin of the other, the suspicion or rebellion of one unavoidably involves the other. In conflict is disaster, in understanding there is triumph.

Herbert Hoover.—We seem to have lost our national perspective. We hold to our surplus of food and raw materials with which our warehouses are bursting. People do not realize that if we are to abandon the 3,500,000 children of Europe who are ambassadors of good will our hope for a cure of world evils is gone. These starving peoples of Europe may be driven to madness by the hardness of our hearts.

Individual Honor Foundation of Good Citizenship

Frank L. Dykema.—The foundation of citizenship, in a form of government in which the citizen is answerable only to himself for performing his duties, must be individual honor, a realization and conviction that citizenship involves a moral obligation to oneself and one's fellows, and an appreciation that failure to perform the duties of a citizen destroys self-respect and discredits him in the minds of others. Citizenship must be interpreted in terms of honesty, fair play, the square deal and the golden rule. The same reaction should take place in the mind of a citizen who fails in a duty, that occurs in the mind of a normal man who does a dishonest thing.

Owen Wister.—A cuckoo is a bird that never builds its own nest, but always lays its egg in the nest of some other bird. Our country is crowded with cuckoos, all very busy laying eggs. They meet and plot. They harangue each other. They curse the house of Uncle Sam. They ask, "Who was George Washington, anyhow?" They tell each other that private property is highway robbery. That is merely because they haven't any and want yours and mine without working for it.

David Starr Jordan.—The immediate outlook in America is trying, but secure. The basis of the Republic is far too solid to be overthrown by any force now active in the world.

E. E. Nash.—In the operation of a railroad nothing is more essential than obedience. The first requirement of a good officer is obedience. He has no right to expect a subordinate to do anything which he is not willing to do himself.

F. W. Wilson.—There has been too much bloodshed since 1914 to begin talking again about treaties, which, even if they are defensive, are nowadays peculiarly offensive.

Edwin T. Meredith.—The Department of Agriculture, in its work of fostering our great basic industry, is the servant of all the people, and if we can bring about a general recognition of that fact I feel sure it will not fail to receive the confidence and support it deserves.

G. K. Chesterton.—I believe that when men are happy, they sing; not only at the piano, but at the plow, at their work and in their walks abroad. I am well aware that modern men do not sing in the street very much. I am well aware that cosmopolitan money lenders never sing, but die with all their music in them.

William G. McAdoo.—Mexico is a country of vast undeveloped resources. She is absolutely dependent upon foreign capital for their development, which is essential to the progress and prosperity of her people. I think that President Obregon and his colleagues are determined to establish a new era of peace, order and prosperity in Mexico.

M. L. Burton.—The test of individual efficiency and usefulness to society centers in a man's ability to use his mind. Emerson never erected a more arresting danger signal than when he exclaimed: "Beware when the great God lets loose a thinker on the planet!" If we could only harness the mental power of America today we could solve the gigantic problems of the world.

Agriculture—Manufacture—Transportation

Seven hundred Chinese have sailed from Hawaii to work on Cuban sugar plantations.

According to estimates approximately 200,000,000 feet of lumber will be cut on Crown lands in New Brunswick during the present year.

Two thousand, five hundred and three oil wells were completed east of the Rocky Mountains during January.

Cotton exports last year exceeded those of any other commodity and were valued at $1,136,408,916.

A majority of New York shipyards have granted a reduction of 12½ per cent in the cost of repairs to government vessels.

The German potash syndicate has petitioned the government for the privilege to raise domestic prices 50 per cent.

During 1919, 69 per cent of the world's total of petroleum production came from the United States, according to recent figures of the Geological Survey.

G. W. Forster of the Bureau of Farm Management of the Department of Agriculture predicts that farm labor will be plentiful throughout the entire United States during 1921.

As a result of the record-breaking cross-continent trip completed by postal airplanes recently a continuous day and night air-mail service between San Francisco and New York City will be established May 1.

What is believed to be a world's record for a parachute jump was recently established at Fort Sill when an aeronaut jumped from an airship at a height of 22,000 feet, landing six miles from his take-off.

To restrain the state of Illinois from interfering with the collection by the railroads of the increased passenger rates a permanent injunction was granted by the United States District Court of Appeals, February 15.

The Nebraska College of Agriculture has produced a grading system to enable producers in the state to obtain better prices.

Since 1910 the Pennsylvania Railroad has laid 56,230,904 new cross ties and 1,347,289 tons of new rail.

The Spanish Government suspended wheat purchases recently on account of the over-supply of the Spanish market. However, this act will not interfere with individual purchases.

The president of the Illinois Veterinary Medical Association states that hogs can be successfully vaccinated for hog cholera with the double treatment when but a few weeks old.

Last year Prussian state railway thefts reached the number of 238,975. More than 17,500 loaded freight cars were stolen. Fifteen thousand thieves were arrested and convicted.

The excess of exports over imports in January, 1921, was $446,000,000 against $243,000,000 in January, 1920. With the exception of December, 1920, this is the largest monthly excess of exports since June, 1919.

To combat the peach borer a chemical manufactured from coal tar products and known as Para-di-choro-benzene has been found to be of value if applied during the last week in August or before September 10.

Fur men state prices obtained during the first few days the auction has been in progress in St. Louis have shown a general increase of about 25 per cent over those prevailing at the sales last month. They believe improved trade conditions have caused the upward trend.

After extensive experimental work it has been found that repair bills for damaged roads would be greatly reduced if motor trucks were designed to carry more of the loads put on them over the front axle and less over the rear wheels. Pneumatic tires also reduce impact and cause less damage to the highways than those of hard rubber.

More than double the average amount spent annually for ten years in building the Panama Canal was spent last year in constructing highways by Federal aid.

Soy beans thrive north to a latitude of about 46 degrees. Soy beans are largely raised for hay, silage and pasture. Samples were sent north during 1920 and of 551 reports returned to the Department of Agriculture 400 were favorable.

A new process for the manufacture of carbon from lignite will be utilized in a $1,000,000 plant to be built in Monroe, Louisiana. The new carbon will be used in the process of refining sugar, replacing the bone black now in use.

The South African Railways are advertising in this country for bids covering the electrification of two sections of their lines, one involving the line from Capetown to Simonstown and the other between Durban, on the east coast, and Pietermaritzburg.

Because of the fact that no rain has fallen on the desert country near Phoenix, Arizona, thousands of sheep would have perished had not the Forest Service thrown open to the sheepmen the Crook and Tonto forests lying adjacent to the desert in the foothills of the mountains. Even this is considered as only temporary relief.

The United States Department of Agriculture spent $250,000 in establishing Durum wheat in this country and the wheat of this variety now produces $50,000,000 a year. It cost $200,000 to introduce rice and the California crop alone is now worth $21,000,000 a year. The American Egyptian cotton crop introduced at a cost of $40,000 now produces $20,000,000 a year.

In Sweden a central arbitration board has been created consisting of seven persons—three appointed by the government, two by council of the Employers' Association and two by the Workmen's National Council. Its object is to render it easier for employers and workmen to have collective agreements interpreted, thus obviating recourse to strikes and lockouts. Decision of the board is final.

Briefly Told

The nickel cigar has made its reappearance in the loop district of Chicago.

The rainiest spot on earth is the Waipo Valley in Hawaii. The precipitation averages one inch a day.

The University of Maine faculty recently suspended fifty-six sophomores for hazing which consisted of a paddle gauntlet for freshmen.

Senators will use the famous "marble room" adjoining the Senate chamber as a lounging place. The chamber is to be barred to visitors.

The accident rates in coal mines of England, France, Belgium, Germany, Austria and Japan are much lower than in America because all the miners in one mine speak the same language.

So the public will knew them and as an additional punishment, the Chief of Police of Juarez ordered the heads of all pickpockets shaved when culprits are released from prison.

Every Saturday afternoon at the American post in Samoa, the civil prisoners are granted parole until six a. m. Monday. Many of the prisoners spend their week-end visiting relatives.

The money that American women spend on jewelry, feminine foibles and beautifiers in general during one year would pay either half the interest on the national debt or the entire appropriation for the Navy, including new ship construction.

All needy residents of Muskegon, Michigan, who are out of work are being given aid by the city. The city loans the funds, taking a note payable on demand without interest.

At a recent meeting of the Entomological Society of America a scientist stated he found a small tribe of Mono Lake Indians which caught and dried a ton and a half of caterpillars in a season for food.

A girl fourteen years of age was brought before a New York court as a truant from school. The girl proved that she was married and the court ruled that a housewife is not required to attend school regardless of her age.

Fifty thousand dollars in notes, bank stock and currency were uncovered by a farmer in Illinois who was harrowing corn stalks in a field. Safeblowers had buried the loot there the previous week.

Thieves stole the lightning conductors from the twin towers of Notre Dame Cathedral in Paris. The conductors were topped with platinum worth nearly fourteen thousand francs. The thieves worked seven hundred feet from the ground and are supposed to have been steeplejacks.

Fig Tree John, an aged Indian hunter who guided Fremont through the West on his expedition to the Pacific Coast, receives from the government every five years a new blue suit with brass buttons similar to those worn by the Americans in Fremont's time. In 1845 he expressed a wish that he be paid for his services in that manner as long as he lived.

Opium disguised as sausages was recently seized on a steamship at Brooklyn during a narcotic raid by internal revenue agents and police. The searchers were unrewarded until one of them cut open a frankfurter and discovered opium instead of ground meat.

Gates to the White House grounds were opened under the first order issued by Warren G. Harding as President of the United States. They have been closed to the public since early in 1917 when the United States severed relations with Germany.

A different odor for every frock is the latest fashionable idea of Parisian dressmakers. A pink creation should give out the delicate scent of roses, while lily of the valley is considered more appropriate for white gowns. The scent is sewed into the seams of the frock.

The mystery of the missing balloon of the United States Navy that landed near Moose Factory was cleared up when it became known that Ojibway Indians had divided the huge bag into ten sections from which they made several canoes and papoose carriers. The ropes are being used for dog harness.

Claiming that she and her five children have been placed in a position of want because three Cleveland men gambled with her husband, a woman is suing the three men for the amount they won from the head of the family.

The President of the United States has a special flag used on occasions when the President appears in his ex-officion function as commander-in-chief of the Army and Navy. The flag consists of the coat-of-arms as they appear on the President's seal, against a blue background and flanked by four stars.

The Carnegie Corporation has entered into an agreement with the Leland Stanford University of California to establish a food research institute at that university to study problems of food production, distribution and consumption.

America's Fastest Growing Weekly
Circulation This Week More Than 300,000 Copies

The American people are paying tribute to the one magazine in this country which has courage to print the truth—which is uninfluenced by the powerful interests that exercise such a tremendous pull on the newspapers and periodicals of the United States. Not only are we continuing the discussion which has aroused the entire country to the conditions which have been created by a highly-organized minority, but our plans call for the publication of further truth-telling, informative articles on subjects which for the most part heretofore have been denied the public.

Disarmament and Peace!

EACH THINKS HE IS BEING PURSUED
—Orr in the Chicago *Tribune*.

THE MOVEMENT IS UNDER WAY.
—Knott in the Dallas *News*.

By SENATOR Wm. E. BORAH

THERE is a great opportunity for the leading three or four maritime nations of the world to effectuate something real in the way of a disarmament program. It has been my observation that officials of various governments have been inclined to oppose disarmament, but one should note carefully whence these arguments come.

The people, however, are for disarmament everywhere. They want it, and they should want it, because it is the only way to stop the ever-mounting burdens of taxation. However, we shall never get any real measure of disarmament except through a great popular movement for it.

I have no doubt at all that an agreement could be reached if the people of the respective countries could have their voices heeded. Whether or not the militaristic forces, the armament forces, the armament trust, and the men who represent them both in this country and elsewhere are sufficiently strong to prevent the people from having their way, I do not yet know. They give some indication of activity. It may be that they will control the situation. There is no doubt that the masses of Japan, the same as the masses of this country, desire an understanding by which the two nations shall not enter into a competitive building naval program. It is equally true, in my judgment, in England.

The point, however, the most important point is that there is a practical possibility of it. I think there is other good to be had from the effort, even if we do not succeed as fully as we desire. I think we owe it to the people of the country, before we put upon them any greater burden for naval armament, to demonstrate that the men in public places have used their utmost effort, and in good faith, to secure an understanding. We ought not to ask them to carry

Stock Raisers of New Mexico Suffer Annual Loss of Millions Through Depredations of Wolves, Coyotes and Mountain Lions

By HARVEY W. PATTON

PREDATORY animals, such as wolves, coyotes, mountain lions and bob cats, are costing the stock raisers of New Mexico $2,000,000 annually through the killing of their stock. This is in spite of the fact that the Federal Government is doing its utmost to exterminate the pests, with the state and stock raisers co-operating. The county authorities were active in the campaign, too, but right now the counties are not helping for two reasons. The first is that the counties in which coyotes are numerous are short of funds and cannot pay the bounty of $2 for each coyote slain. The other is that when the bottom fell out of the fur market back East coyote pelts dropped from $12 each to an average of $1.50 each.

Up to a few months ago many New Mexicans made a business of trapping coyotes for the bounty and the price of the pelt, the pelt being theirs to market as they chose. Now they have all quit, leaving the entire field to the government, the state and what assistance the stock raisers themselves can give in ridding the state of the beasts.

It is authoritatively stated that the individual trappers were not always scrupulously honest in their dealings with the counties previous to the time they stored their traps away. For instance, not so long ago it was only necessary to take the coyote pelts to the county clerk, who would count them and issue a certificate on the county treasurer for payment of the bounty. Some hunters who lived near where the lines of three counties joined had no difficulty in taking the same bunch of pelts to the clerks of the trio of counties and getting a bounty certificate from each. If a hunter had 60 pelts he was entitled to $120 bounty, but by tricking the three counties, he was able to collect $360. In addition to this, the pelts were his and he used to get a good price for them. The counties finally discovered the swindle, and now every county in the state has a rule whereby the ears and fur of the head of the coyote must be left attached to the pelt when it is submitted to a county clerk for a bounty certificate. The clerk promptly slits the ears or head, and it is impossible for the hunter to cash in on that particular pelt or pelts in any other county.

Approximately 10,000 coyotes a year are being killed in New Mexico, and it is estimated that there are still 30,000 more roaming around and preying on stock, principally lambs, which indicates that there still is a big job of extermination ahead, with one less agency—the individual hunter—to do the exterminating. Some of the counties now owe hunters as much as $6,000 with no telling when they will be able to pay. Therefore it is unlikely that these fellows will get back into the game in a hurry, when they cannot collect the bounty due them and with no market for the pelts.

It would be interesting to know what kind of furs the coyote skins are called when they reach the retail stores in the big cities of the East. Some New Mexicans who know all about this hated and cowardly animal confess they do not know what fine name they are given. They must make up in fairly high-priced garments, else a single pelt wouldn't bring $12 when times were booming, and several pelts are necessary for a garment.

With the bob cat it is different. The fur of this animal is very fine, but it would never do to retail a garment made of its fur as wildcat or bob cat, so the fur is dyed, a fox head is put on it and it is sold as a fox stole.

But getting back to the original discussion. The work of exterminating the beasts is in charge of the Biological Survey of the United States Department of Agriculture, and the men actually engaged in the work are known as predatory animal and rodent inspectors. The headquarters of the inspectors is in Albuquerque, with Charles F. Bliss, an expert on the animals and their habits, in charge.

There are seven or eight trained hunters in the field all the time. Theirs is a lonely life, for they camp in the mountains or anywhere the pests may be roaming and killing stock. The cowboys help them by giving tips on where they saw signs of the animals. The hunters only come to civilization for supplies for themselves or their horses, but they are required to keep a diary of their daily operations and results, and report regularly. Their camp is always in the open country. These hunters are paid from $100 to $150 a month, and they must provide their own sustenance. The furs of the animals they trap or shoot are turned over to the government, which sells them at the best market price, the proceeds going into the Treasury Department toward the upkeep of biological survey. The hunter gets no part of this money, his salary being his only remuneration. Some of the hunters came out here as health seekers and took up the study of predatory animals, and under government training, are now considered experts. In fact, some of them are said to be more proficient than the old and professional trappers.

Predatory animal extermination is now on a scientific basis. The old method was to trap coyotes and wolves, but poison has been found more effective. Old wolves are trap-wise; in fact, they are educated, and they are hard to get through that method. For instance, if a hunter hits a wolf trail and sets out four or five traps, he may get a couple, but others will come along, see the victims in the traps, spot the empty traps and shy away. That is education for them. Besides, some of the old grandfather wolves have been trapped before and freed themselves, which was still more education.

Above—A trapper and his catch, a grizzly bear, called a predatory animal in New Mexico, because it kills stock and game. There has been constant warfare between the ranchers and the wily animals of the plains, and now Uncle Sam has taken a hand. His enlistment in the fight promises to curb the activity of the stock-killing animals.

Below—Spotted deer, which mountain lions in New Mexico are killing in large numbers.

Coyotes like fat more than anything else, and that is what is used. The hunters set out a pre-bait, that is, pieces of fat pork, near a carcass. If coyotes are around, the scent reaches them and they come for the fat. The hunters are thus apprised of their presence. Then they put strychnine in little squares of fat pork, and when the coyotes come back for more food, they eat the pork and the poison. Care is used not to make the poison too strong, for the animals won't eat the meat if they taste the poison.

The visitor mentioned that he had been informed that there was no way of telling how many coyotes were killed by the poison, as they wander away and die and nobody ever sees their bodies.

"As to that," replied an official at the headquarters, "we know that poison killed 3,000 last year, and we figured that this was 75 per cent of the number killed by that method. Of course, the large number trapped or killed by forest rangers, stockmen and individual hunters should be added to the total number exterminated."

The official was asked about the destructive instincts of the mountain lion.

"The lion is the worst enemy of deer in the state," he said. "This beast kills many deer and delights in slaying fawn. Sheep, too, are his prey. Not long ago one of them went through a herd of sheep and killed 30 just for the joy of killing. There are not so many in the state, but they are difficult to get. However, we have met with gratifying results in our war on them.

"Now, as to wolves. Less than four years ago there were 300 wolves in the state, all preying on stock. Today there are only 25, but we are finding it difficult to wipe them out, because they are cunning old fellows, the granddaddys of the cubs that weren't so hard to exterminate."

Wolves from old Mexico are crossing the border into New Mexico, and this gives the inspectors a new problem. There was a drought on the border during the past year, and all the cattle were moved away, depriving the wolves of their food supply of calves. Well, when the cattle were moved the wolves began coming over into New Mexico for their food. One hunter is getting on an average of two wolves a month.

It is estimated that one wolf will do not less than $1,500 damage a year to cattle at the present price of a steer—about $30—so if these beasts are allowed to multiply it is easy to understand the potential damage to stock.

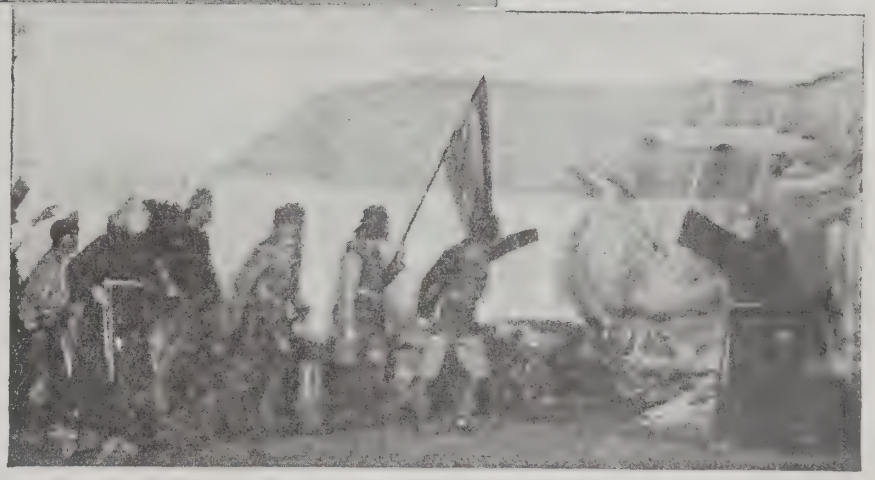
From the foregoing it will be seen that the Federal authorities and the people of this state have a war of considerable proportions on their hands. They insist the lion, the bob cat, the wolf and the coyote must go. It isn't only the stockmen who seek the extermination of these animals. They are destroyers of game, and this angle of the situation came up at the last annual meeting of the American Game Protective Association in New York in April. An appeal was made to help in the fight against the predatory animals, and it is meeting with a hearty response from sportsmen. At this meeting it was pointed out that mountain lions in New Mexico killed 3,000 deer in the state the previous year, while hunters killed only 700. Attention was called to the fact that at this rate of slaughter on the part of lions, deer soon would be extinct in the state. Mountain sheep also are being destroyed by the predatory animals.

Grizzly bears are considered predatory, too, especially when their natural food supply—berries, roots, and so on—is cut off, and then they prey on stock and small game.

Gophers, prairie dogs and jack rabbits are classed as rodents by the biological survey, and they are receiving attention from the inspectors. The gopher and prairie dog are not only pests on the ranges, but do damage elsewhere. For instance, it is estimated that gophers damage irrigation ditches supplied by water from the Elephant Butte Dam in the Rio Grande $60,000 a year. Before the water is let into the ditches the gophers burrow through the sides of the banks, and when the flow comes in the water pours through their holes, flooding alfalfa fields and other growing crops. Ditch riders are employed to discover these holes, and it takes time and money to plug them up. They also can render entire ranges useless by burrowing beneath the grass. Thousands and thousands of acres can be damaged in this way.

And the gophers come to the very gates of the modern city of Albuquerque to carry on their destructive work. If they get into a householder's garden patch he has a difficult job to get rid of them.

While the visitor was in headquarters a request came in from the University of New Mexico, situated at the edge of Albuquerque, to send some one up to rid the grounds of gophers. The little animals got into the grounds and were ruining the lawns.



The East may have its troubles, but any New Mexican stockman will say they are nothing compared to his, with cattle at their present low price and preying wild beasts trying to kill them off even at that.

California's Mission Play and Pageant

By HENRY QUICKENDEN

Top—Scene from the Mission Play at San Gabriel, California. The Indians are shown bringing in the dead body of their Franciscan Spanish friar who had died in the desert with his converts. Right—Frederick Warde representing Junipero Serra, in the Mission Play. At the left are shown some of the Indians in the play. Directly above are Warde and a group of Padres on the steps of San Gabriel Mission. At the right are shown the Padres and the Spanish soldiers at San Diego Bay, 1769, watching for the relief ship from Mexico to save their starving expedition—a scene from the Mission Play.

THE Passion Play at Oberammergau and the Mission Play at San Gabriel, California, are in some respects similar and in others the difference in the two is marked. Because of the likenesses, the California spectacle has been called California's Oberammergau.

The Passion Play of Europe was the inspiration for the Mission Play after a visit paid by Frank Miller, of Riverside, to Oberammergau. He recognized the materials for such a play in the early history of California as that history had been made by the coming of the Spanish expedition from Mexico in 1769 with its contingent of Franciscan brothers under the Father-Presidency of Junipero Serra.

The early history of California had to do with the missionary extension of Christianity even as the history of the Passion Play had to do with the founding of Christianity. The big missionary motive is the same in both plays. This lifts the Mission Play of San Gabriel, near Los Angeles, above the level of amusement. This new pageant-drama, with its Spanish fiesta scene, touches of humor, dancing and gay colors does, however, create and hold the interest of people at the same time keeping them close to the sublime.

The Mission Play is given daily from early in January each year on to the summer months. In the new playhouse to be ready for next year's presentation at a cost of $250,000, this pageant-drama will enter upon a new and permanent phase of its history. This is the tenth season. About 2,000 persons witness it daily and as it is shown twelve miles east of Los Angeles, on the former grounds of the old San Gabriel Mission, it is easily accessible to the thousands of tourists and natives who visit California during the winter months. Among the ruins of the old mission, the Spanish, Mexican, Indian, military and missionary atmosphere of the old days is easily preserved.

Frank Miller, who, as stated, is responsible for the production of the spectacle, first sought out Dr. Henry Van Dyke, at Princeton, to write it. Dr. Van Dyke declined because he could not spare the time in California to absorb the history and the atmosphere. President David Starr Jordan, of Stanford University, suggested later the California poet and journalist, John Steven McGroarty, of the Los Angeles *Times*. He accepted and made it a labor of love. He is a Roman Catholic, but the business manager of the Mission Play Association, E. K. Hoak, is a Methodist.

The play gathers up and immortalizes the early history of California, stressing in its three acts first the dates 1769—when the military-missionary expedition arrived from Mexico at San Diego; 1784—at Monterey when that and other missions were in their glory; and 1847—the beginning of decadence after the Mexican Government had confiscated the mission properties and the Indians were driven back from these centers of civilization.

This history is full of the color and romance that belong to the Spanish-Mexican period of early California and that even is continued to this day in the names and in some of the customs of the Spanish and Mexican elements that make up so considerable an element of this section.

The great character of the play is the Father-President of the Franciscan missionary friars who accompanied the military in 1769 and who died in 1784 after heroic and indefatigable labors. This part is taken by Frederick Warde, who crowns fifty years in his profession with his representation of Junipero Serra, the great Father-President.

An Opera Bouffe Plot

IF THERE is a librettist eager for a comic opera plot funnier and more fanciful far than anything his wildest imaginings are likely to conjure up, let us commend him to the assumedly serious arguments just now occupying much space on the editorial pages of many American newspapers and dealing with the indemnities demanded of Germany by the Allies.

One such article appears under the caption, "German Republic in Reality a Sham." Perhaps you have supposed that the emergence of the German Republic from the ruins of the Hohenzollern Empire was a natural and logical sequel of the decisive defeat of German imperialism at the end of a fifty-month war?

To the ordinary mind, the smashing of the Hindenburg line, the shattering of the German battalions, the utter economic exhaustion of the blockaded country and the complete undermining of the "war morale" of a population behind the lines were stern, cold facts. Recognition by that population of the true causes of woe, misery and disaster in the vaunting ambition and reckless arrogance of the imperial régime, might sufficiently account for the downfall of the empire, following so swiftly on the ignominious flight of the gilt-gingerbread emperor. When to these immediate and obvious reasons for the rise of a Social-Democratic Republic in Germany we join the big fact that for nearly thirty years the anti-imperialist Socialists had been the majority party in the Reichstag by the mandate of a popular vote, carrying on through all those years an active and effective propaganda in the press and on the platform, no difficulty should be found in accounting for a German Republic—that is, the prosaic mind unaccustomed to traveling in the irridescent paths of spectacular extravaganza would find no difficulty.

Foolish delusion this, we are assured by the knowing writers who have been nourishing their mentalities on the jingo pabulum purveyed so generously by the Paris press. The present republic in Germany was merely "a ruse concocted for the undoing of the Allies" by poor Mr. Hohenzollern and his friends, Hindenburg and Ludendorff—actively aided and abetted by Socialists! It was never meant to be anything more than a "temporary makeshift" to tide over until "German intrigue and cunning" should be able, through shallow pretense of compliance with Mr. Wilson's demands, to outmaneuver the keen-witted diplomats of France, Britain and Italy—to say nothing of American diplomacy!

The German Republic, we are solemnly informed, was "faked" in order to fool the Allies into granting lenient reparation terms and to mask Germany's military activities, resources and man power. An army of millions, "every man a trained soldier" and supplied with complete and formidable fighting equipment, is ready to take the field "when the hour strikes."

Proof? Bless you, haven't the junkers already started a movement for the annexation of Austria? Are they not talking openly of the return of the Hohenzollern dynasty to the throne? And—most clinching argument of all—has not the return of the Hohenzollern to rule at Potsdam, as soon as the peace terms are settled, been predicted by Lady Nora Bentinck, niece of Count Bentinck who harbored the ex-kaiser at his castle of Amerongen for eighteen long and weary months?

Truly, the opera bouffe mind hits only the high places in its fantastic flights of imagination. It is exempt from such prosaic considerations as the effect on the German "will to war" of the actual toppling in the dust of the imperial idol with its head of gold and feet of clay.

To this order of mind, the utter exhaustion of Germany's energies and resources in the nearly five years' war orgy, involving the starvation of its women and children, are just "stage business," thrown in for effect. The actual loss of Alsace-Lorraine, Prussian Poland, the Saar Basin, the African colonies, the Shantung lease and the Pacific Islands—all these count for naught. Or perhaps, they are all a part of the "ruse" to fool the Allies, part of the dark, deep and designing plot of the cunning Germans to get out of paying their debts and instead to start all over again the ruction that, in addition to the losses named, killed off some three million of their best men, maimed and disabled as many more, reduced the population to starvation rations during four years, cost the country its industrial and commercial leadership and gave a lasting black eye to its pretense of ethical culture?

Are there no bounds to jingo credulity? Such wild and weird yarns seek vainly to perpetuate the war legend, picturing the Germans as satanic supermen or hopeless idiots. Let us return to normalcy!

The Men Behind the Press

THERE is something worth thinking about in a suggestion made by William J. H. Boetcker in the Erie *Review*. National safety may depend, he points out, on the big guns of our fortifications and our fleets, but even more on the men who handle those guns. The question, "Who handles the gun?" is of such importance that our government recognizes the necessity of putting none but Americans on guard or in charge of these guns.

Far more powerful, however, than all the big guns in the world, as a weapon for the defense and preservation of our democratic institutions, is the press. So Mr. Boetcker asks why this great bulwark of our peace and honor should not be as jealously guarded as are the guns from being controlled and directed by alien and possibly inimical interests? And he suggests that Congress should pass a law limiting controlling ownership of American publications to American citizens and requiring the writer of every book, and of every magazine or newspaper article, to sign it with his name and a statement of his nationality, so that readers may be able to make allowance for national bias or propaganda.

The Obstinate Eleven

DUE perhaps to the ardent temperament associated with warm climate, when the Spaniard is a radical he is very, very radical. In the vivid phrase of pokerdom, he "goes the limit" in socialistic extremism. Spanish revolutionaries are not apt to be troubled by any very delicate scruples as to the use of bomb, torch and dagger in advancing "the cause." But a delegation of Spanish Socialists, recently returned from Moscow to Barcelona, frankly express themselves as "horrified" by the state of things they witnessed in Russia. They visited the country on the invitation of the Soviet Government with every expectation of being able to prove to their associates at home that the Russian experiment was such a success as amply to warrant affiliation with the Third Internationale. Instead, they found conditions of misery, tyranny and oppression beside which the worst of the evils of that monarchist and "bourgeoisie" rule which they had hitherto so fiercely denounced are the merest child's play.

Most of all, they seemed to have been astounded by the utter cynicism with which Lenin discarded any semblance of regard for the most elementary principles of that democracy which is the fond aspiration of the Spanish Socialists. The dictator, they report, offered as obvious explanation of the "delay" in transforming Russia into a happy and prosperous communistic commonwealth, the imperviousness of the peasants to Bolshevist arguments. The peasant class, he said, constitutes the very large majority of the population and they are constitutionally "non-proletarian," so that there is nothing to be done but to hold them in strict subjection virtually making slaves of them, until they are forced to change their minds and become good proletarians.

This period of necessary rule by a small and despotic minority is placed by Lenin at forty years. Meanwhile, as Russia is not an industrial country, the "proletarian" minority has nothing but worthless paper money to offer the peasant majority in exchange for food produced in the sweat of their brows.

Lenin is a vivid reminder of the twelfth juror in the old story who blamed the failure to agree on the "obstinacy" of the remaining eleven good men and true.

The British-Russo Treaty

THE document signed by representatives of Great Britain on one side and of Soviet Russia on the other on March 16 is not called a treaty. It is diplomatically referred to as a "trade agreement." Substantially, we are told, it is the same as the draft taken from London to Moscow by Leonid Krassin, Soviet minister of trade and commerce, in January last. While its provisions deal chiefly with a resumption of trade between the two countries, the agreement is a compelling illustration of the far-reaching scope of all agreements in regard to international trade. So it is actually a treaty and one in which the clauses "incidental" to providing for trade resumption are probably those of chief importance.

Many people who have all along clearly recognized the perils of Bolshevism, and who have not hesitated to express horror at the mere suggestion that a British Government should grasp the "bloody hand" of the Bolshevist usurpers, will condemn the treaty as a gross surrender of principle and a deliberate sanction of terrorism and massacre. There is something to be said for this view, but it must also be admitted that the humbling of pride is not all on one side. In exchange for its virtual recognition of the *de facto* government of Russia, Britain has exacted certain substantial advantages for herself and for the rest of the world.

Under the treaty, Britain will in large measure placate both the radical labor element and the trading class. For the latter, it insures the first opportunity for profitable trade with a population of more than 100 millions. But it also secures the clearing of mines from the Baltic and approaches to Russia, the ending of the blockade on both sides, and pledges against its renewal. The Soviet Government is particularly bound to refrain from any encouragement of Asiatic peoples to action against British interests, especially in Asia-Minor, Persia, Afghanistan and India. As the spread of Bolshevist influence in the Near East and the Far East is regarded just now as one of the most serious menaces to world peace, this provision must be considered broadly as of much more than British national interest. So also the provisions for the renewal of postal and telegraphic communications.

For all the world, most decidedly, an advantage is gained in the treaty's provisions binding each party to refrain from hostile action or propaganda outside its own borders against the other's institutions, or giving assistance or encouragement to any such propaganda outside its own borders. It may be taken for granted that propaganda against British institutions includes propaganda against American institutions—against democratic institutions anywhere. At any rate, it opens the way for similar agreements with the United States, France and the Scandinavian countries, as well as with the Latin-American republics.

French opinion is said to regard the agreement as unworkable, in view of the present revolt in Russia and Russia's shortage of exportable stocks, and to be averse to entering into any similar agreement until Soviet Russia recognizes the old Czarist debts. But as the treaty would stand if the Soviet régime should be overthrown and experience has taught us that its early overthrow is problematical, Britain's example will be likely to commend itself to both France and the United States as time-saving. Lenin's cynically avowed disregard for the sanctity of promises and pledges was given by Mr. Wilson as sufficient reason for refusal to negotiate with his government. But in the present state of international ethics, perhaps self-interest is no inconsiderable guaranty of good faith. From the humane viewpoint, of course, the big thing made possible by the treaty is that it makes possible the feeding of millions of human beings now on the edge of starvation, probably averting a famine as appalling as that in China. With even an approach to economic rehabilitation, the Bolshevist horror will be most surely undermined.

Be Careful, Mr. President

RUMORS from Washington indicate that the head of a private detective agency may be considered for the job as chief and reorganizer of the combined secret service departments of the United States Government. President Harding would do well earnestly to consider all that this may mean. It is not fitting that the secrets of the United States Government should be put at the disposal of private detective agencies. No man should be entrusted with any part of a special agent's work until all his antecedents are fully known. It is to be hoped that President Harding, through haste or inappreciation of the importance of the post, will not make an appointment which can make itself felt hurtfully not only in every department of government but in every aspect of American life as well.

Mr. Ford's Page

IT IS being sent out from Washington that the government is through interfering with business, and the announcement will be received according to the point of view of the individual. Some will hail it as a release from past restrictions and as a repudiation of a certain policy; others will regard it as a backward step and as a partial abandonment of the principle that property must always be held subservient to the people.

Every man must discuss this according to his experience and no single point of view will include all the truth. We may set it down as fundamental, however, that the intention of government has not been to restrict business but only the abuses which have crept into business.

This restriction has itself been subject to abuse at times. That is those who have been given the power of restriction have sometimes been under the control of unscrupulous interests who were quite willing that restrictions should be imposed upon their competitors, thus creating a disadvantage. But on the whole this business of restriction has not worked. Certain specific abuses may have been corrected, but the mainspring of all business abuses has not been touched, nor can it be by mere enactment of statutes.

The first revolt of the American mind against the tendency toward swollen irresponsibility in business was shown in the anti-trust agitation in Roosevelt days. Business was then forming in large aggregations and, as in all new developments, there was a tendency toward thinking itself the be-all and end-all of national life. There had just been a very severe industrial depression, and the vision of smoking factory stacks and "the full dinner pail" had played their part in an industrial stimulus and growth without parallel.

Life, however, cannot grow disproportionately on one side without causing inconvenience, and presently a protest came. It was but natural. And, just as before, when statesmen set their energies to making business lively, so now statesmen bent to the task of making business behave. Thus was inaugurated the era of control. There was a great deal of so-called "trust-busting," which had the effect principally of changing the legal form of the trusts and nothing more. There were investigations and systems of inspection, and with it all a few genuine reforms like the abolition of the railroad rebate.

Now, about all we have gained out of the experience is this: human nature runs wild if it gets the chance, and the tricks it will play cannot always be understood from the surface but must be probed, and, moreover, it can evade practically every law set up for its control.

So far from this being an argument against what the government tried to do, it is an argument for its being done in a more effective way.

The misdemeanors of business have been bad for business; if not always bad for the profits, then bad for the reputation of business. All the annoyance of the restrictions put on by government did not more than compensate, if indeed they did compensate, for the abuses which business practiced. That there was wrong-doing, no one doubts. That some of this wrong-doing was of the most sordid and nasty character is all too true. We despise the man who manipulates the scales in selling a pound of food; what contempt is sufficient for a corporation which systematically cheats on weights, using therefor a system whose intricacy and costliness and conspiratorial teamwork was worthy of a better cause!

None of these things is found out, however, unless there are agencies for finding them out. That is where the government has done its best work—in studying business, and during the progress of the study detecting the rotten spots. The Federal Trade Commission, for example, found out a great number of rotten spots. The bribing of purchasing agents, the use of deceptive advertising, the immoral and condemnable adulteration of commodities—these are rotten spots which require disinterested outsiders to detect and expose. People "on the inside" are sometimes too heavily interested to embark on the work of self-correction.

And yet, until this entire corrective work proceeds from the inside, it cannot be accomplished as it ought to be. Not legal but moral compulsion is the best law.

Business as a life-profession should have its recognized professional ethics, to violate which declasses a man. The motive power which would make such an ethical system vital, is the idea of Business as a field of human service, just as Education or Medicine are.

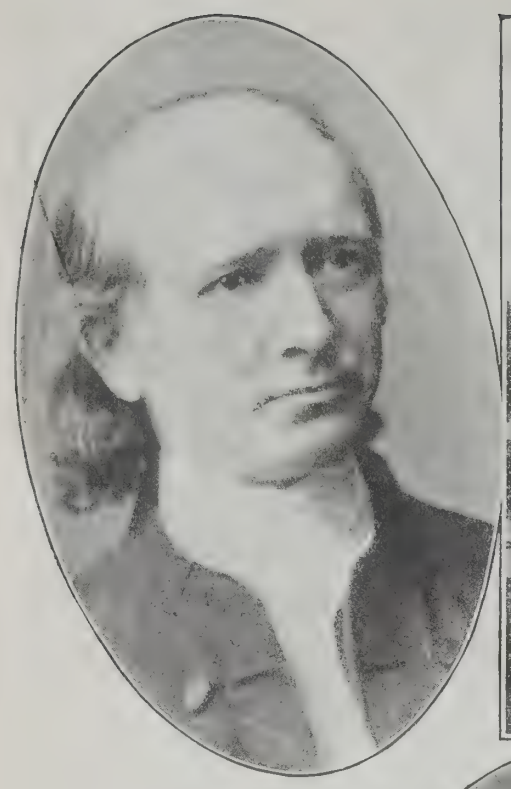
That idea is existent but it is not regnant. People know it as an ideal but not as a reality. There is, moreover, a considerable doubt expressed at times whether business can be run on that principle.

Malpractice in Business cannot become any more substantial or lasting than malpractice in any other field. There is no question about that. Business always goes on, but "businesses" are falling by the wayside every day. It is not only true to say that good principle is compatible with business (and that is expressing it as if business were merely moving over to make room for good principle because, forsooth, good principle has influential friends!), but it is also true that bad principle is absolutely incompatible with good business. A great many people have tried it, and though they may have been "successful" in scooping in the profits for a time, they have not succeeded in business.

Some men stay in business just as the burglar does; he may remain a burglar but he has to move around a lot. Some business men pursue the same business methods, but not long in the same locality nor in the same line.

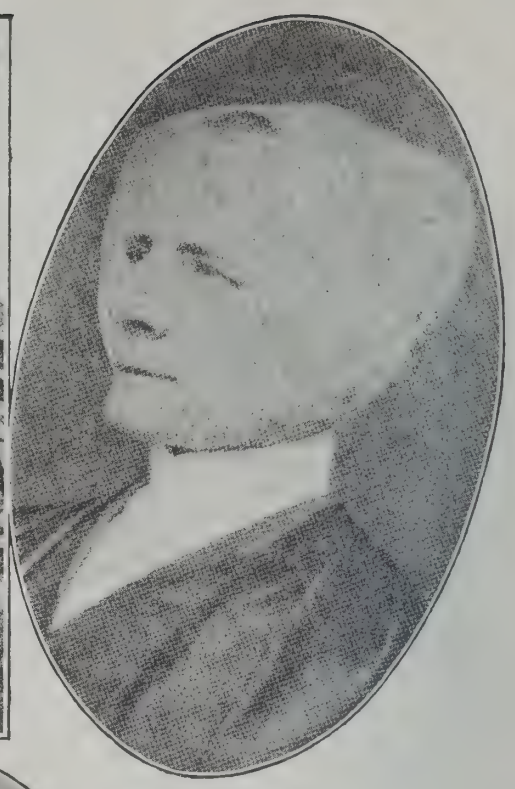
Business must be controlled from the inside, and the governing principle must be a mingled knowledge of social needs and moral laws, if it is ever to be properly controlled at all.

What Business needs is a little of the professional spirit. The professional spirit is one that seeks professional integrity, from pride, not from compulsion. The professional spirit detects its own violations and penalizes them.



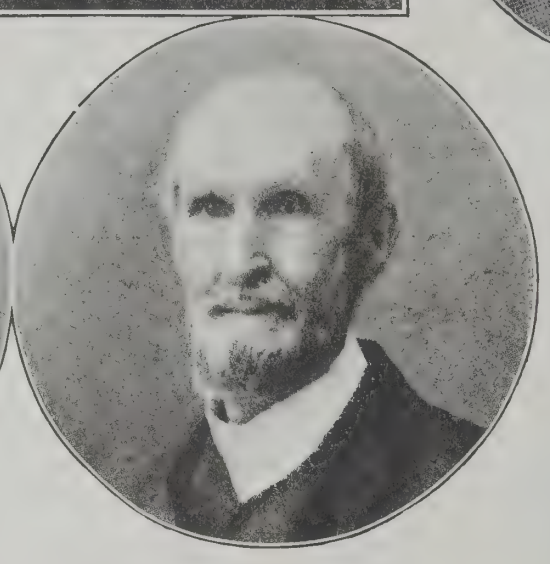
Take a hospital, for example: you don't need a policeman to keep it clean. It is part of the hospital's work to be clean, because absolute cleanliness helps to provide the atmosphere which has most healing and least harm in it. Hospitals keep themselves clean because cleanliness is not only their pride but their business. A dirty hospital simply is not a hospital, and no amount of make-believe can render it a hospital.

Business will one day become clean on the same basis. It will become clean as a preventive of commercial septic conditions. A machine that stops every little while is an imperfect machine, and its imperfection is within itself. A body that falls sick every little while is a diseased body, and its disease is within itself. So with business. Its faults, many of them purely the faults of the mechanism of business, but many also the faults of the moral constitution of business, clog its progress and make it sick every little while.



Now, you can inspect weights and measures, but not motives. You can examine income reports, but not the managers. That is, the rights and wrongs of business begin much further back than any legal process can go; indeed, legal processes are effective only as they produce alarm, fear or shame further in where the soul of the business lives.

Some day the ethics of business will be universally recognized, and in that day Business will be seen to be the oldest and most useful of all the professions.



BUSINESS is the oldest of professions, and if it had a code of ethics it would be the most useful profession practiced by man. It serves humanity at more points and is more vitally connected with all human interests, than any other. If a man is honest elsewhere, but not in business, what does his honesty count for? If a man is capable elsewhere, but a dunce in business, how incapable he really is! Business is a queen of the sciences, employing and encouraging them all; a field for the employment of all virtues that man can exhibit; the one profession capable of a dignified and expansive oversight and patronage of all the others. Where it falls beneath this estimate, the lack is in ethical pride. Business can best be controlled from the motive within.

Top, left—Elder JOHN VANCE. At 92 he was an excellent specimen of the old-time Shaker Elder. He was more than six feet tall and straight as an arrow. Like all the Shakers he was typical of the best American blood and exemplified the longevity of the communal life in which the average is about twenty per cent better than the average in New York City, Center—The Shaker meeting-house at Mount Lebanon, N. Y. Next to the Mormon Tabernacle in Salt Lake City, it has the largest arched ceiling, entirely unsupported by pillars, in this country. Right—Eldress ANNA WHITE. Bottom—Sister MARTHA ANDERSON and Elder FREDERICK W. EVANS.

The White Communists

Shakers Preparing for New Era of Development

By PAUL TYNER

COMMUNISM is a term which just now is associated with the violent and bloody chaos of Bolshevist Russia, with the scourge of Trotsky's armies and with the menace to all order and civilization of the Third Internationale and its propaganda of disorder and destruction everywhere. But the spirit and aims, as well as the method, of the noisy revolutionary self-styled Communists of today are at all points the very antitheses of those of the people who for more than one hundred years have exemplified on American soil the blessings and the possibilities of the genuine communal life. There is nothing "red" about the Shakers. Not the bloody banner of Revolt, but the white flag of Peace is the standard they lift aloft.

Revisiting the community at Mount Lebanon, New York, recently, after more than twenty years, the writer anticipated possible changes. The passing of almost a generation must mean the passing of old friends. It is something new in Shakerism, however, to find it exemplifying the maxim, "other times, other manners." This was the first surprise experienced. The visitor found that those he had known as the younger men and women, less wedded to the past and more concerned with the future, had come into control. Despite the traditional conservatism of advancing years, they had justified the radical promise of their youth and become daring innovators—comparatively speaking.

That the Shakers are "dying out," is a frequently recurring news report. It was recently announced that three aged survivors of a once large colony at South Union, Kentucky, were making arrangements to have their lands which are valued at more than a million dollars revert to the state. Only a few years ago the United Brethren Church bought at a bargain some 20,000 acres of good land and many buildings at Lebanon, near Dayton, Ohio, thrown on the market by the demise of the Shaker society there. I remembered that Charles Nordhoff in his "Communistic Societies in the United States," had predicted, 45 years ago, the early vanishing of the Shakers, who then numbered about 3,000, and whose total wealth was then estimated at about ten million dollars. Early in the nineteenth century, following a phenomenal accretion to their membership flowing out of that "Kentucky Revival," which occupies so important a place in William James' "Varieties of Religious Experience," there were some twenty Shaker societies with an aggregate of 18,000 members. This was the high-water mark. There are now but nine "societies"—those located at Mount Lebanon, and Watervliet, New York; West Pittsfield, Massachusetts; Canterbury, New Hampshire; Enfield, Connecticut; Alfred and Sabbath Day Lake, Maine; South Union, Kentucky; and St. Cloud, Florida, with a total of 14 "families" or communes and less than 500 members. The present is the low-water mark in membership.

Mount Lebanon is situated in one of the most charming and picturesque spots in the Berkshire Hills close to the New York-Massachusetts state line, and the splendid concrete interstate road between Pittsfield and Albany runs through the Shaker lands just above the village. It is also reached from Chatham on the Boston & Albany Railroad by a Rutland branch line that runs to New Lebanon, the birthplace of Samuel J. Tilden and of Martin Van Buren and still the home of the Tilden Chemical Company owned by nephews of the Democratic leader of a generation ago. Driving up the hill from the station on a recent spring-like morning, the visitor was struck again as a quarter of a century before by the beauty of the scenery and the bracing quality of the air. Westward stretched the Lebanon Valley, dotted with cultivated fields and pastures and merging into the gentle slopes of well-wooded hills. "Beautiful for situation is Mount Zion!" has always been a favorite quotation of the Shakers. For a century and more Mount Lebanon has been to them a hallowed spot—a veritable "Zion," hilltop of past glories and of future hopes.

One is struck too by the marvelous quiet of the place, as, after a turn in the road just past a beautiful oval-shaped pond bordered by willows and neighbored by saw mill and grist mill, on a rise of ground, we turned in at the broad entrance-gate and drew up at the door of the white two-story and attic building reserved for the reception of visitors and administrative offices. Shaker villages are never noisy. The very atmosphere suggests unhasting and unwasting activity. But this morning there was something different in the silence everywhere to that of a generation ago. It was deeper with a certain indefinable intensity in it. Yet there was nothing of the quietness of death or decay about it. It had, instead, a brooding and expectant quality, such as one might imagine filled the palace of the Sleeping Beauty. It seemed to soak into the visitor standing for a moment on the porch and looking across the garden to the big dwelling house, north to the great stone barn, with the stables and the laundry on one side and the sisters' shops on the terrace ascending to the main road, on the other; south to the village stretching for half a mile along the main road. In the old days, the scene would have been marked by the figures of bonneted and kerchiefed sisters and broad-brim hatted brothers in overalls or long coats passing briskly to and fro on their various errands. Now there was not a human being in sight. Again one sensed that feeling of anticipation, of a general waiting for the word that would wake the whole place into brisk and purposeful activity.

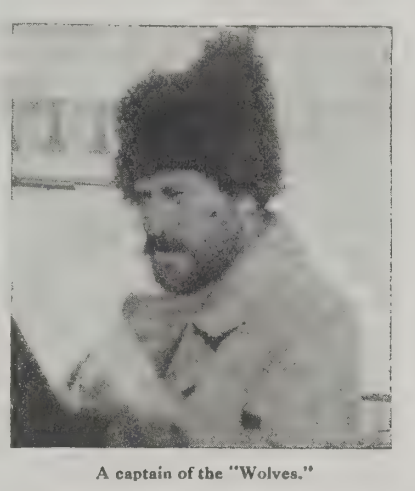
This impression was strengthened by the appearance of the buildings. For the most part they looked as if they might have been erected within the year. Yet all were anywhere from 40 to 70 years old. The Shakers build solidly and substantially, to start with, and then they religiously keep buildings in excellent repair and renewal. A knock soon brought Sister Martha Burger to the door. Almost from her first words of kindly greeting, the visitor's sense that there was a spirit of Shakerdom facing forward rather than backward was confirmed. On his previous visit, Martha had been one of the "younger sisters"; but as even then her hair was prematurely white, one had no difficulty in recognizing her. Her younger sister Sarah, she said, had succeeded the beloved and widely known Eldress Anna White as Eldress of the "North Family" (in every Shaker village there is a north, south, center church and south family—named from their locations), and Martha herself had succeeded Sister Catherine Allen as the sister charged with the reception of visitors and leading the young sisters' classes, among many other duties. Sister Catherine herself had for years been called to the joint leadership, or "ministry," of the whole Shaker Order with the visitor's old friend, Walter Shepherd, a sturdy reformer from that great breeding place of reformers, Manchester in England, who had been "Second Elder" in the old days.

While waiting for Sister Catherine to come from the dwelling of the Church Family in the center of the village, Sister Martha told the visitor of changes the years had brought. Significantly enough, it was learned that the old distinctive dress (as severely austere as that of nuns for the women), had been abandoned. It seemed strange to find the sisters reveling unabashed in "woman's crowning glory" undisguised by stiffly starched and ironed white bonnets, and to note the disappearance of the old puritanically kerchiefed necks. Let it not be imagined, however, that the modernized costume of the Shaker sisters comes within a thousand miles of the low-necked and short-skirted dress now seen everywhere in Philistia. Modesty and simplicity still characterize it, if not as ostentatiously as of yore. It gives one a little bit of a shock, however, to find the good sisters quite frankly and humanly shaking hands with a brother. During the previous visit it was rigorously taboo—and had been for nearly a century—for a sister to touch a brother or a brother a sister. The brother could not even lend a helping hand to a sister getting in or out of a vehicle. And they never sat at table together.

So one surprise followed another. "I'm going to give myself the pleasure of dining with you, Brother Paul!" exclaimed bright and earnest little Sister Catherine with smiling enjoyment of the visitor's surprise. In old days there were no pictures on the walls. Now one found pictures everywhere—photographs, etchings, excellent landscapes in water colors and pastels and an oil portrait of Elder Walter by a noted

(Concluded on page 14)

Exiles From Crimea



By PAUL BOWERMAN

Russians selling money and jewels on Step street, Constantinople.

IT WAS a beautiful day in November when the refugee boats from Odessa began to file down the Bosphorus. At first they attracted but little attention, although everyone knew that Wrangel's valiant defense of the Crimea had been crushed by the Bolshevist hordes, and that an exodus was to be expected. The village people gathered on the quay and hazarded a guess that the Russians had come, and having identified the Cossack uniform upon the swarm of men who crammed to suffocation the first of the boats, they returned to their work and thought no more about it. Constantinople had seen too many refugees to be moved by the sight of a boatload.

Scarcely had the first boat passed when the second steamed into view—larger this time and even more closely packed. It seemed alive with men. The decks were a solid phalanx of brown sheepskin, and without the aid of a glass one could see they were too crowded to sit down. They had climbed all over the rigging, they filled the hatchways, their heads hung out of portholes, they perched on the roofs of the cabins, fore and aft. The shouts of the street-gamins attracted the villagers to the quay again, and interest grew warmer. It suddenly flashed upon everyone that the thousand or more soldiers they saw on the decks had not rushed up from below to enjoy the Bosphorus—they were there because they couldn't move, and hadn't moved since they left Russia no one knew how many days before. They were but a fraction of the human burden which that old battered hulk was carrying somewhere. The villagers began to estimate the thousands who were jammed, deck below deck, in the bowels of the ship. It was an uncomfortable reflection. Before they had finished their speculation the boat had disappeared around a bend in the Bosphorus, and another appeared. Then another, and another.

A captain of the "Wolves."

All day long those silent ships came out of the Black Sea, until people grew tired of counting them. It was a strange fleet; their only point of similarity was the closeness of the gunwales to the water. Old Russian battleships, with rust-splotted hulls; clumsy cargo boats, ill-suited to such a cargo; sailing schooners, brown and weather-stained, with dirty canvas flapping against rotten spars; broken-down coasting steamers, listing heavily to port or starboard; and most tragic and pathetic of all, a wheezing little river boat, with side paddles, dragging in tow a ridiculous red lighter-ship that rose and dipped in the tiny wavelets of the Bosphorus. Only a few of them could have weathered a gale, and some could never have crossed the Black Sea in ordinary circumstances. It was by a miraculous stroke of good fortune or the intervention of Providence that those treacherous waters had seen a week of absolute calm.

Evening came and still the chain of ghost-ships continued like a row of fireflies down the Bosphorus. The city saw them pass the Golden Horn and swing around Seraglio Point into the Sea of Marmora. How many of them were there? Where were they going? On the streets, in the trams, on ferry boats, every one repeated to his neighbor the questions that had been put to him. Out of the haze of rumor and guess evolved the opinion that the French, who had guaranteed Wrangel's Government, were shouldering the responsibility of caring for the remnants of the disaster. Tunis and Algeria and Madagascar were spoken of as the possible destination of these fleeing thousands. They were to be given land, perhaps, to begin life over again as colonists. But no one knew. And while they talked and argued and gesticulated, more ships came.

Business men, commuting across the Bosphorus from Haidar-Pacha and Kadikeuy the next morning, brought the news that startled the city into a realization of the magnitude of the problem that confronted it. The ships had not gone on. Instead they lay at anchor in the Bay of Moda, just below the city off the Anatolian shore. The ferry boats had passed close enough to hear the distressing cries for help. And while every small craft that could be pressed into service was commandeered to carry bread and water, and while relief organizations were straining every nerve to cope with the emergency, and while destroyers and sub-chasers under half a dozen flags were darting from ship to ship in an effort to sift out the sick and to begin the task of sanitation, the seemingly endless procession of ships still came down the Bosphorus, executed an arc around Seraglio Point, and came to anchor with the others. Finally, some days later, the *Ekaterinador* limped in with a ghastly story of a frantic struggle between rapidly disappearing rations and a broken engine. It was the last one. Fifty-two in all, with between 100,000 and 150,000 persons on board—homeless, for the most part penniless, and very close to the point of starvation.

The peoples of the city, already weary of feeding and caring for the less fortunate, for once forgot the crossfire of hate and prejudice and greed, and joined hands to alleviate a distress far greater than their own. How the machinery was got under way and by what superhuman efforts the feat was accomplished, is already known. Many of the accounts were written in the first moments when the task seemed too monumental to carry through, and others in the last moments, when the end was near and the momentary burst of unselfishness had relapsed into the inbred rut of political or national feeling.

Three months have passed since that beautiful day in November. The ships in the Bay of Moda have gone away. What has become of that floating city? A few thousands went to Bulgaria and Rumania; a few more risked a return to Odessa; and some of the Don Cossacks were taken over by the Allied armies and sent to the front in Asia Minor. The others are in Constantinople.

With every new influx of refugees the city changes color, chameleon-like. The Greeks pushed the Turks into Stamboul and took over Pera and Galata for themselves; the Armenians, coming in increasing numbers during the war, overswept both; and now it is the Russians who supply the dominant tinge to the fascinating patchwork. And of all the threads woven into the strange pattern, theirs is the most interesting.

For a few weeks following their liberation from the ships in the Bay of Moda they were riotously happy. The years of war and revolution were over and they had at last found a haven where there seemed to be no more uncertain tomorrows. They filled the streets with their long military coats and great fur hats, asking nothing more than the overwhelming relief from the nightmare of their flight from Sebastopol. They brought laughter to a city that had almost forgotten how to smile, and unmindful of the astonishment that their levity evoked they succeeded in maintaining among themselves a buoyant enthusiasm that was delightfully infectious.

There was already a sprinkling of Russian cafés along the Grand Rue de Pera, and it was there that their seemingly unquestionable thirst for happiness reached its climax. The *Grand Cercle Muscovite*, the *Ogoniok*, the *Iar*, the *Rose Noire*, and a dozen others were crowded with the brilliant blue uniforms of the Don Cossacks and the beautiful gowns of the tall fair women. It mattered little if those uniforms and gowns constituted the sole possessions of their owners, or if they had no home to go to when the music stopped or even a place to sleep. It was enough that they had escaped the retaliation of the Bolshevists, and that there was food to eat and wine to drink, even if it be paid for from a slender purse. Never had the music been gayer, never had violins played so hauntingly their melodies, never had the long fingers of the sallow-faced pianists so thrilled the hearts of those music-loving people. And impelled by the magic of the artists who were playing as they never had played before, they would rise to their feet in a spontaneous burst of pent-up feeling and raise their voices in a song to the memory of an old Russia and to the hope of a new.

There was something pathetic in their childlike oblivion to the imminence of a new disaster. The city contented itself with an indulgent smile, not begrudging a brief span of happiness to a people who had suffered so much, and yet cynically wise in the knowledge of its own relentlessness. Meanwhile the throngs of uniformed men, resplendent in jewelled daggers and ivory buckles and spurred boots, promenaded the streets with their wives in magnificent sables and sealskins. But even then they were beginning to discover that their money was vanishing, that there was no market for their jewels, and that there was no work to be had.

The break came within a month, swiftly and without warning. What had yesterday been a colorful pageant was today a pitiable spectacle, as if by sinister magic. The gaiety and the laughter in the streets died way. In the cafés they tried bravely to maintain the illusion, but they counted their change and were content with a bowlful of *bortsch* where but yesterday a feast had scarcely sufficed. Unable to pay the exorbitant rents of Pera, little by little they scattered into the labyrinth of twisting streets and bewildering byways of the outer quarters. They moved from place to place in a descending scale of rents, satisfied with smaller rooms, and resigned to interminable flights of stairs. They crept nearer and nearer to the filth and depravity of Galata, drawn unwillingly into an existence that grew daily more intolerable and more inevitable.

The jewels disappeared from the hands of the women, and the gold daggers from the jackets of the men. The professional money-changers, swamped with the paper money of half a dozen régimes, refused to accept any more. Musicians who had studied under the great masters of Berlin and Petrograd slipped into dirty beer-halls and pounded out ragtime on battered pianos for the edification of tipsy sailors and the short-skirted girls of Galata. All day long a group of artists, no longer able to buy canvas and oils, trudged up and down the Grand Rue exhibiting a handful of ink sketches to an indifferent public.

GENERAL BARON WRANGEL

From morning till night crowds of Russians stood patiently in the upper half of Step street trying to sell the paper money of Nicholas and Trotsky and Kerensky. At first a few curious passers-by bought a note or two to take home to their children, and grinning bootblacks demanded a thousand rubles for a shine. Occasionally an itinerant vendor would part with an orange or a manderine for a note that once had been worth thousands of dollars. This flurry of interest soon subsided, and the tired, hungry men stood there, with pockets full of brown notes now as worthless as so many handbills, and endured the jibes of the street-gamins who imitated their accent and exchanged torn-up newspapers with one another in tragic mockery.

The last few weeks have brought a quickening of the crisis. There has been a sifting-down which has scattered to the four winds the ashes of the lower strata of the Russian colony, and has brought to the surface a few brilliant successes—the very limited few whose unusual talent in music or art or commerce has gained for them the attention and patronage of the city. Because of the publicity attendant upon the achievements of these few happy exceptions, the benevolence of the city has been withdrawn from the thousands of the less fortunate, in a mistaken idea that the circumstances of the two unequal classes are improving alike. In a city so vast and rambling and ill-organized it is impossible even to approximate the straits in which the greater numbers now find themselves. But an afternoon's walk from Pera down into the festering side-streets of Galata, across the Pont Neuf to Stamboul, and thence into the crooked passageways back of the Valideh Mosque, would convince the most superficial observer of a calamity which will some day take its place in history as one of the most tragic addenda to the horrors of the World War.

It was only yesterday, on the Pont Neuf at noon, that the crowds of hurrying people saw two men who might have been taken as the personification of the disaster. Leaning against the iron railing of the bridge was a tall, gaunt figure enveloped in a torn and dirty military coat, wrinkled in such a fashion that one could see that it had served in the double capacity of mattress and blanket. An enormous hat of wolfskin was pulled down over eyes that were bloodshot and fevered, its great size accentuating the hollowness of his cheeks. His epaulets were those of a colonel, and on his sleeve was the insignia of the famous Death's-Head Regiment. In each hand he held a thirty-cent can of Alaskan salmon, which he was trying to sell to the passers-by, calling his wares in broken Turkish in a voice hoarse from coughing. There was something in the way his elbows slumped back against the railing that betokened the weariness born of despair.

Presently he straightened himself up, transferred one can of salmon to his left hand and raised his right, numb with cold, to a smart salute. The general returned the honor, set down a bundle, and stopped to talk with the Death's-Head colonel. The general was a short, stout man with black, snapping eyes and features in which generations of breeding and culture were evident. They talked for some moments and then shook hands. The colonel raised his hand in a parting salute, and again offered his two cans of salmon to the public. The general picked up the bundle he had set down. It was a cheap handbag such as the native women carry to shop in, crammed with the morning edition of the *Stamboul*. He walked away toward Galata crying, *"Stamboul! Stamboul!"* It was incredible. Yet not one of the hurrying thousands so much as turned his head to give the little drama a passing glance. It was a living miniature of the vast tragedy of reversal which has destroyed all human security and reduced all human values to nothingness.

The Jews' "Defenders" Make a Poor Showing

They Fail in Frankness; Billy Sunday an Example; the Hearst-Bernstein Botch; the Gravity of a Jewish-Negro Alliance

THE Jews are most unfortunate in their "defenders." Perhaps the initial misfortune is that the Jewish mind has reverted with automatic directness to the idea of "defense," and not to frank self-criticism and correction. The bankruptcy of Jewish leadership has never been so apparent as in this situation which only calls for an examination and a repudiation of that which brings shame upon the Jewish name. But had such examination and repudiation been made by the leaders, it would have involved confession of the inadequacy and incompetency of their leadership, and in the present state of affairs, when their power is already swaying perilously, they dare not make this confession.

It is now nearly a year since THE DEARBORN INDEPENDENT, desirous of bringing into wholesome and sanitary public discussion a question which was festering in silence and suspicion, began a series of studies of the Jewish Question. The question of the motive which inspired these studies has received various treatment. It is a striking note in all the Jewish attempts at explanation, that these studies are in retaliation for some wrong or injury committed by a Jew. It must be rather humiliating to be compelled to postulate wrongdoing on the part of one's race to account for a study of that race. However, THE DEARBORN INDEPENDENT is able to defend the Jewish name in this particular and to say most plainly that the present series of studies are not in retaliation for the misdeed of any Jew, and to add, if need be, that they have not in view the injury of any Jew, great or small, but solely the prevention of further injury to the world through the vast misuse by Jewish leaders of the power that rests in their hands.

In all that year of discussion, Jewish leaders have been making a "defense" which even the Jewish people have felt was far beside the point. Rabbis, publicists, political and racial leaders have all arisen and shouted and called names, but have carefully avoided the questions at issue. There have been "challenges," all of which have been strategic attempts to stop the discussion and bury it in the smoke of "investigations" which could easily be controlled. Personal abusiveness has been resorted to, not to mention lurid and ludicrous falsehoods—but never a focus on a fact, never the choice of a concrete situation, and a candid examination of that.

Jews Disgusted With Sham Defense

ALL these activities have had two purposes in mind, as those who understand Jewish modes of procedure have long since seen; first, to befog the issue with irrelevant matter; second, to divert the studies from the main line to some side line which runs off into a morass. There will be plenty of time to explore the side lines, but the wiser element of the Jews will meet the question on the main line. The refusal of the astronomer to debate the proposition that the moon is made of green cheese, would hardly be received as proof of his fear to meet the facts of his science.

The first real Jewish "defense" was a counsel to violence, for boycott is of the essence of violence—a commercial "pogrom," to use a word the safe and comfortable Jews of America like to employ. This counsel of violence came from the leaders, of course, and was stimulated by secret meetings where every effort was made to rouse the passions of the Jews to *unlawful* activity. We stress the word *unlawful*, because the Jewish leaders counseled a course which they claim in the courts to be unlawful when used against themselves. How, when and where this was done does not matter in this connection. The point is that in following this desperate line the Jewish leaders confessed their utter incompetency and un-Americanism. Had they been plain men of common sense they would not only have seen the lawlessness of their course but its impossibility as well. But why expect blind leaders to be wise? Who can say that this frenzy of incompetence may not be one of the influences that shall open the eyes of the Jewish masses to the folly of their leadership?

The extent to which this idea of violence "caught on" among the Jewish people can be gathered from a study of several thousands of communities throughout the United States. There is no doubt that the Jewish attitude of "Beware!" toward the non-Jews is still strong in a few quarters, but there is also no doubt that it is rapidly disappearing. The Jewish individual is not a fool, and he is not misled by the folly of his so-called leaders nor by the antics of those "Gentile fronts" who find the Jewish "defense" rather profitable in one way or another. Indeed, some of the most refreshing expressions that have come to THE DEARBORN INDEPENDENT are from Jews who shrewdly estimate the qualities of the Jewish "defense." These sound-headed Jews clearly see that the best defense is to take the situation as it actually is, analyze it, act frankly upon their findings, and seek to remove those mistaken policies and qualities which are always turning up to plague the Jewish people.

In their non-Jewish "defenders" the Jews have had a precious handful. As friends of the Jews they may be just as desirable as any other friends, but as "defenders" their main service is to divert attention for a moment. Then the general situation of the Question closes over them and they are forgotten. Jewish humor must have had numerous occasions to observe how well justified is the Protocols' estimate of non-Jewish ability in the light of the intellectual character of non-Jews' "defense" of the Jews.

Billy Sunday and His "Jew Sermon"

BILLY SUNDAY, for example, is one of these Jewish "defenders." He is not at all clear what he is defending them from, but he is defending them just the same. In the sermon list which Mr. Sunday dispenses during each evangelistic engagement there is what is known as "the Jew Sermon." Men who have been connected with the promotion of his campaigns say that this "Jew Sermon" is depended on to enlist a portion of the financial support which might not otherwise be obtainable in defraying the necessarily heavy expenses of a Billy Sunday campaign. Jewish contributors are more easily approached through the introduction of "the Jew Sermon." It is a familiar compilation of complimentary statements, all of which have been made in this series, such as the fact that Jews sailed with Christopher Columbus to discover America, Jews are never seen in the poorhouses, and so on.

It recites the statement of which Jewish writers delight to remind Christians, namely, that Christ *was* a Jew. The tense is emphasized because Mr. Sunday's utterance is capable of interpretation in the present tense. "If ever you walk the streets of glory, and are kept out of hell, it will be because of your repentance and faith in the shed blood of a Jew." This is questionable theology, to say the least, for it is the faith of the Christian church that Christ was and is the Son of God. Nevertheless, the statement as made by Sunday is quite in harmony with the Jewish view of the case. Few things are more nauseous and reprehensible than this senile acceptance of the statement that "your god is a Jew," "We gave you your god, now we'll give you your government." It is very much as if the American people after execrating the assassin of McKinley should journey to Africa and find that Czolgosc had become the god of the Africans. It would give the American a sense of superiority to think that an outcast of his people had become the god of another race.

Well, that does not matter either. Mr. Sunday speaks about "my friend, Nathan Straus." He says, "You pay tribute to the Jew for the suit you have on and the dress you wear; for they control the tailoring and the custom-made business of the United States. There is not a cabinet in Europe that hasn't had Jews in its membership. Some of the shrewdest financiers in the world are Jews. It was really the banking house of Kuhn, Loeb & Company, of New York, that refused to loan Japan the money to prosecute the war, that really hastened peace. Isabella had to hock her jewels to pay for Columbus' voyage, and she hocked them to a Jew. And the Jew is just as distinctively a Jew today as he was 6,000 years ago. All hail, the Jews!"

Mr. Sunday Didn't Know—But

THIS is great "defense." Everyone knows what it is, a rehash of Madison C. Peter's little book. But it doesn't touch the case. Each statement Sunday makes contains the vital essence of criticism, but he doesn't know it.

Mr. Sunday has not read "The International Jew." More than that, he has not even read his textbook, the Bible. Dollars to doughnuts he cannot tell offhand the difference between Judah and Israel, or he would stop confusing them. And it is doubtful if he can tell where the Jewish Christ found his first disciples, among the Jews of Judea, or the non-Jewish Israelites of the north country. Mr. Sunday, excellent and useful as he is in certain fields, is simply not master of his subject, and what is worse, he has not tried to be.

That he speaks without knowledge when he attempts to characterize the studies which have appeared in THE DEARBORN INDEPENDENT is shown by the following telegrams:

"William A. Sunday, Jan. 11, 1921.
"Fairmount, West Virginia.

"We have read your comment as carried by the International News Service, of January 7, on Jewish series now appearing in THE DEARBORN INDEPENDENT.

"Will you be so good as to inform us whether you have read any one of the forty or more articles which have appeared, and if so, which one, and if more than one, how many? Thanking you for telegraphic reply at our expense.

"The Dearborn Publishing Company."

Here is Mr. Sunday's reply:

"Dearborn Publishing Co., Jan. 11, 1921.
"Dearborn, Mich.

"Have read frequent excerpts from Jewish series printed in other papers and comments by Metropolitan Press. I had no reason to question the correctness of these reports. The part with which I especially disagreed was the statement that the Jews were aiming at control of the important activities of the country. I have not found the slightest evidence of the existence of such a condition.

"W. A. Sunday."

Mr. Sunday did not read any "excerpts" from these articles in any "other papers" up to January 11. None was printed. Up to that time the newspapers printed Jewish propaganda only, and Jewish propaganda is the only knowledge Mr. Sunday has of the Jewish Question. The part with which Mr. Sunday especially disagreed was, he says, the statement that the Jews are aiming at control of the important activities of the country. It would be difficult if not impossible to arrive at an understanding of how Mr. Sunday could especially disagree with what was not said. If he had known, he would have seen that it was not "aiming at control" which was stated, but *actual control* which was shown. And as for Mr. Sunday's failure to find evidence of such a condition, there is plenty of evidence in his own sermon on the Jews. He possibly does not consider it as evidence because he read it in a newspaper and did not gather it by direct observation, but he considers it good enough for his sermon.

Mr. Bernstein Plus Hearst Type

AS A "defender," Mr. Sunday occupies the position of one who has not studied his case. Whether he would study it or not, we have not asked him. From his own standpoint, his sermon to the Jews is an unfaithful and halting piece of evangelism. Obviously he feared to go sled-length in his effort to convert the Jews—that would be to "insult" them; he therefore remains in the region of half-truths and stereotyped praises and veers from his stated purpose as soon as he has disposed of his bouquets.

Mr. Sunday, by the way, is not the only minister who confessed by telegraph that he spoke without knowing whereof he spoke. However, the great majority of them proceeded at once to look into the Question for themselves, and the result has been confirmatory of most of the statements made in this series. As a matter of fact, the Bible is the best textbook from which to begin the study of the Jewish Question.

The "defense" of the Jews has been exceedingly stupid not only because a part of it has been made in utter ignorance of what the charge was (as if one should defend a man for murder who is only charged with speeding), but also because of the assumption on the part of some of the defenders that the question could be settled by personalities. Thus far this resort to personalities has been taken exclusively by the Jewish side, though not for lack of material on the other. On that line too there would be no hesitancy to try conclusions, but there are a few Jews at least who appreciate the forbearance in that respect which has been shown.

The chief weakness of the "defense" which resorts to personalities is that it settles nothing. If all this were mere say-so, dependent for acceptance upon the credibility of certain witnesses, an attack on personalities might serve to break down the basis of belief. But if the case consists merely in bringing to light certain facts which anybody can see for himself by the mere act of looking, then the matter of personality has

nothing whatever to do with the weight of the case. If the articles in THE DEARBORN INDEPENDENT have been successful in securing the adherence of great hosts of Americans, it has not been because of any blind dependence on the statements of this paper, but because this great host could look about in their own communities and in their own spheres and see that what the articles have said is true. It is a matter of sight, not faith.

That is the reason why Mr. Herman Bernstein's articles were totally unworthy as a defense of his people and valueless as a contribution to the Question. Mr. Bernstein, with the aid of the pro-Jewish Hearst syndicate, and the lurid-lettered Hearst newspapers from coast to coast, may laugh every person connected with the matter out of court, but when he has done, the Facts are still there, and the indictment is unchanged. Doesn't Mr. Bernstein see that? Of course he does. He is not a member of the American Jewish Committee for nothing. The American Jewish Committee exists for the management of just such policies and propaganda as have forced the Question to the front in these United States. The Bernstein wad is shot, just as the Brisbane wad and the William Hard wad and numerous lesser wads have been shot, but they never reached as far as the Question.

Crediting men like Bernstein with an interest in the matter as well as a certain amount of intelligence, the only explanation that can be made of their performances is that *they are sparring for time.* Not daring to meet the Question, for that would involve too much confession, they are hopeful that the Question itself will wear out; but that they might not seem to be inactive they break in from time to time with such performances as those of Bernstein, which are as formidable as if they were pot-boilers wrung out of the necessities of an impecunious writer.

If the Question dies out; if these studies can be brought to an end because of the barrage of abuse which the Jewish press is hurling, then the Jewish leaders can proclaim a victory, and they will have Mr. Bernstein's large red headlines in the Hearst papers to prove that they were in the thick of the fray. Again, how unfortunate are the Jews in their leaders and defenders!

There is room for suspecting that the weakness of the Jewish defense is due not only to a reluctance to indulge in that confession which would result in the further breach between the mass of the Jewish people and their incompetent leaders, but also to a hope that in the meantime some "back fire" may be started which will be effective in drawing public attention away from the main Question to something else. That has been the mark of Jewish strategy from the beginning of this series—to start a diversion.

Starting a Negro "Back Fire"

TO ILLUSTRATE this will involve mention of a phase of the Question which has not yet come up for detailed discussion. It is one of the disadvantages which these studies labor under that it is impossible to present the material on as wide a scale as might be desirable. Thus many phases of the Question are still waiting publication. One of these relates to the bond which exists between certain Jewish influences and the Negro population of the country. There have been strange unrests and convulsions among the Negro people in the United States, prophets have arisen, new watchwords have been coined, a spirit wholly unlike the Negro as his normal self has made its appearance, until it is no longer anything but the plainest truth to say that the Negro Question is more acute as a *national* problem than it ever was before.

Nor is this the fault of the Negro. Fortunately the American knows the Negro better than anyone else and is not a victim of "race prejudice." All the obtainable facts seem to point in the direction of the conclusion that the Negro is being tampered with by influences cleverer than anything that he could devise and more malicious than anything the Negro himself would naturally create. That is, the Negro is being used as a tool by some influence whose interest is in national disorder. It is a big question and there is plenty of material to present regarding it. But this much is said merely for introduction. The well-known assertion of the Jews that *"the Negroes and the Jews are the only two oppressed races in the United States"* has long been harped into Negro ears.

Now for one of the reactions. It is solemnly declared in a Negro publication that:

"The Protocols of the Elders of Zion is the ritual of the Ku-Klux-Klan."

"'The International Jew,' now running in THE DEARBORN INDEPENDENT *is a series of lectures from The Imperial Wizard to the members of the Ku-Klux-Klan,* instructing them how to perfect the Invisible Empire."

This paper seriously instructs its readers to read THE DEARBORN INDEPENDENT'S articles with this secret key in mind. For "Jew," read "Klan." For "American Jewish Committee" read "American Klan."

Thus, in the minds of the Negro readers of the newspaper here quoted the seed of the suspicion is planted that the Jews and the Negroes must stand together in the fellowship of persecution, which really means, in the present state of the Negro mind, something more.

Still Building on the Sand

IT IS not easy to believe that this amazing attempt to start a back fire among the Negroes was conceived by a Negro. It is out of harmony with his point of view and his temperament. The idea was very probably of quite other origin.

We would call the attention of the United States Government to the present situation among the Negroes and urge that a strict investigation be made into those influences which are arousing the Negro to courses of which he will become the victim while his hidden instigators go free.

It is a fact explaining this flight of the Jews to the Negroes for help, that the help which the Jewish leaders seek is usually a help based upon a false idea. That "we are the only two oppressed races in the United States" is both untrue and seditious, since there are no oppressed races here, and such an amalgamation of two races under the plea of oppression constitutes a threat against the rest of the people.

In time the Negroes too will find that out, after they have served the Jewish leaders' purpose and possibly suffered for it; for all other people up to this time have found that out and have withdrawn.

Just now the "Chosen People" theory as a hindrance to plain speaking about Jewish influence upon American life is less flourishing and impressive than perhaps at any other time in the country's history—why?—because the Jew, by inserting his influence into the very councils of the Christian church, has stressed that "chosen people" theory until it burst all bounds of truth and justice.

The Jewish people, as people and as Jews, have always been able to appeal to the Christian church and the Christian conscience in the United States, in the complete assurance that what was right and generous in their behalf would be assisted in every possible way. This has been the attitude of the church since its implantation in the United States, and before. The Jews prospered under this attitude, indeed could not have prospered without it, and were anxious at all times to strengthen as far as possible the doctrinal basis on which this spirit rested. That doctrinal basis was, of course, "the Chosen People" theory. It was not obnoxious until it became overworked.

No text of scripture has been in wider use the last six months in the United States than that which is quoted as saying that anyone who blesses "thee" shall be blessed and anyone who curses "thee" shall be cursed—the common interpretative reference being made, of course, to the Jews whom we see today, Morris Gest, and "the Wolf of Wall Street," as well as the others. It represents a "fear of the Jews" strongly fostered by misemphasis on certain words supposed to favor the Jew in all that he does and set him apart from and above the rest of society with relation to his social doings.

World Rule Not by Materialism

THAT has largely broken down. First, it has broken down because it was spoken of All Israel, eleven-twelfths of which is now without identity, and not of the Jews only; second, because even if the Jews are "the chosen people" their own scriptures distinctly declare that the methods they now adopt are not the chosen methods. Some people—even ministers who ought to know better—are so weighed upon by superstitious fear and a desire to accommodate present-day Jewish facts to anything but common sense, that they even excuse modern Jewish methods with the assertion that "the Jews are prophesied to rule the world" and "these methods are the way by which the prophecy is being fulfilled"—these methods being the cornering of gold, the control of commerce and all the other things this series has talked about.

The absurdity of this cannot fail one day to strike the minds that harbor it. If tomorrow the fiction that gold is wealth should be done away—and some day it will be done away—all this control of the world through gold will be done away too, and the international Jews will be left alone sitting upon their little hillocks of metal. They will be the first junk-dealers of the new era, and their junk will be their gold. Again: let the world eliminate war and all the profits that accumulate from it, past profits in the form of interest, present profits, and future profits which will continue as long as the present system of credits and interest continues, and one moment after this elimination all this "prophetic" control of the world goes to smash. If the Jews are to rule, it must be with a scepter other than gold. If they are to wield universal power, it cannot be on the basis of their present materialism.

The basis is wrong. The fear is wrong. The whole doctrine has been used for wrong purposes, for the stoppage of truth-telling and the concealment of situations that ought to be disclosed.

That refuge, however, is passing. No more "anti-Semitic" pursuit and judgment faces the Jew today than that which he may find in his own Scriptures. He now flees to a coalition with the Negro, because the other which he is fast losing is based on a wrong idea which he had no little hand in fostering.

How many more such moves will he have to make before he sees that his refuge is not in the "delusion of persecution" which he has permitted to victimize him, but in a frank face-to-face estimate of the situation as it appeals to him to reconcile himself with the world—not by ceasing to be a Jew, not by pretending not to be a Jew, but by ceasing to be anti-social, and by ceasing to pretend that his Semitic descent elevates him above the general social interest.

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

Nahum Sokolow, according to the Jewish Correspondence Bureau's Paris correspondent, in explaining why the "Polish-Jewish Question" was not raised at the Geneva meeting of the League of Nations, said the Jewish Committee went to Geneva with two main objects. One was to try and secure "minority rights" in countries where they had not yet been granted. This was fully obtained. The League adopted the principle of requiring recognition of minority rights, which means "special Jewish rights" exclusively, as a condition of League membership.

Three Jews have been elected to the new Parliament of the Union of South Africa. They are Morris Alexander, David Harris and Harry Grauman.

"The rabbi of history has usually been pictured as passive, tolerant, submissive and saintly. Dr. Stephen S. Wise gave a vivid portrayal of the modern rabbi when at Ann Arbor he addressed the student body of the University of Michigan and thrilled his auditors with a dramatic defense of his war record . . . . Now that he has been attacked, Dr. Wise will not only defend himself but show the 'Anti-Semite' how the modern Jew reacts to these wholly unwarranted assaults. The submissive Jew is of the past. Today we are alert and fighting back"—*Rabbi Coffee in Chicago Jewish Sentinel.* These be brave words; but it will be news to those who were present on the occasion mentioned that the auditors were "thrilled" by the New York rabbi's performance. It would be nearer the truth to say that they witnessed an exhibition of questionable taste and an abuse of the hospitality of the university to devote his time to an arrogant and insolent attack on a member of the faculty on a purely personal issue before an audience gathered to hear a lecture on "Americanism." And it might be added that up to date, Rabbi Wise has failed to keep his threat to hale Professor Hobbes before the courts, although the latter has replied to the rabbi's "challenge" by repeating in the public prints his characterization of Rabbi Wise's "war record."

Jews will be especially grateful to President Wilson. He favored liberal immigration laws, and worked for the rights of minority races. He appointed no Jew to office as political reward for votes delivered. Those Jews he did select were worthy representatives, as Judge Samuel Alschuler, of Chicago, Justice Louis D. Brandeis, of Boston, Henry Morgenthau and Abram I. Elkus, of New York City. When the President sought advice, he consulted such men as Felix Frankfurter, Rabbi Stephen S. Wise, Edward A. Filene, Bernard Baruch, and Julius Rosenwald. Citizens of this type, serving America with unselfish devotion, have blessed Judaism as well.—Rabbi Rudolph I. Coffee, in Chicago *Sentinel.*

According to a Jewish News Service dispatch from London, the next Zionist executive will consist of Professor Chayim Weizmann, Nahum Sokolow, Sir Alfred Mond, Major James Rothschild, Judge Julian W. Mack, Julius Simon, Nehemiah De Lima and M. M. Ussishkin. It is suggested that Mr. Justice Brandeis remain as "honorary president of the world Zionist organization," and there is some agitation to have Zhabotinsky and Neiditch added to the executive as representatives of the Russian Zionists.

Kansas' Four Legisladies Are Home-Makers

Not Only Have the Fair Voters Been Shown How to Mark Ballots—They Have Been Instructed How to Scratch Them!

By LILLIE GILLILAND McDOWELL

WHAT woman will do with the vote is no longer a matter of speculation. During the month immediately preceding the first national election in which women were permitted the right of franchise, the National Good Government Bureau mailed out approximately 40,000 Good Citizenship leaflets to women inquirers. One hundred thousand political platforms and leaflets were supplied them by the Democratic and Republican parties.

Many states, acceding to popular demand, had their own bureaus. Especially noteworthy is the achievement of Missouri. The Missouri State League of Women conducted a political information campaign which embraced the sending out of explanatory information concerning the marking of ballots and *the scratching of them;* and the conduct of a political information bureau which really informed. This bureau kept on file records concerning the candidates from each party, the information being obtained through questionnaires sent to the candidates themselves. These records told where each candidate stood on questions vital to women and children, and something of his record as office-holder. Even his religious affiliation was given.

Thus through this nation-wide informative movement and its resultant good upon the election which followed, has woman proved her fitness for the ballot, and the whole has been, as some one trenchantly put it, "A wonderful contribution to forward citizenship."

But the holding of political office by women, particularly such office as has to do with legislation, is, comparatively speaking, as yet in its tentative stage. The states have proceeded cautiously here. But two women have been elected to seats in the Lower House of Congress. No state has had a woman representative in its Upper House.

Conservative Connecticut leads with five women members in its legislature. Kansas and Colorado come next with four each. California and Utah each have three. New Hampshire, New Jersey and Oklahoma have two apiece. Idaho, Indiana, Michigan, Montana, Nevada, New York, Oregon, Vermont, North Carolina and Washington each ventured one. Thus it will be seen that less than half the states have woman representation.

Why this notable lack? Is woman afraid of the venture for herself? Do men fear that she will spring too much sob stuff, or over-much freak legislation?

The women members of the Kansas legislature may be said to be "safe and sane" on these lines. Kansas "tried it out" with one woman member last term and liked the brand she picked so well that three more were added this year.

A Kansas newspaper woman happily coined the term "legisladies," as distinguishing the Kansas women members from the male members of the House. The name fits. They are ladies. They are essentially feminine. All are home-makers, who put home first. They have attempted no freak legislation. One of them even voted for the repeal of the state's drastic anti-cigaret law, on the grounds, not wholly feminine—many male members accounted for their votes in the same way—that it "didn't work in her town." One complains that the Topeka sidewalks hinder her in the wearing of high heels. Another begged a member addicted to lengthy flights of oratory, to let up a little that she "might get home in time to set her hens." Still another boasts of the fact that she helped to pick more than $400 worth of strawberries from her home garden last year.

At least two of the Kansas legisladies have judicial minds. One acquired hers by association with her lawyer husband. The other is a lawyer. Miss Nellie Cline studied law with her father, and was admitted to the Pawnee County bar in 1912. Although her county gave 1,000 majority to the opposition ticket, Miss Cline defeated one of the most prominent attorneys of her county.

While a number of women have been admitted to practice in the state courts, they have confined their activities largely to office service. Miss Cline is the daughter of G. Polk Cline, one of the most widely known criminal lawyers of Western Kansas, and was associated with him in the firm of Cline and Cline. She is a brilliant young woman as a first-er. She was the first woman in Kansas to practice before the supreme court of the state, the first to appear on the program of the Kansas Bar Association, the first and only woman Democratic member elected to the House, and the first unmarried woman to sit in the legislative body in Kansas. Although she possesses many fighting traits inherited from her father who is a veteran Democratic leader and old-time legal warrior, she brings no fads nor isms to her work. Rather her interest lies in the problems of good roads and transportation, as related to her section of the state, which is a garden spot for wheat-growing. She has been given place on many prominent committees, where her legal knowledge has proved of much help.

Mrs. Minnie J. Minnich, of Sumner County, is the wife of H. J. Minnich, of Wellington, a local Santa Fe engineer. Mrs. Minnich was born and raised on a ranch in New Mexico and received her education in the public schools of Raton and at the Ladies' College, Liberty, Missouri. Immediately upon finishing the course here, she became her father's assistant and associate in business on the New Mexico ranch. Needless to say, the live stock interests of her section have in her a warm supporter. She has never run for public office before, but her fine business training and experience stand her in good stead in her legislative work, and she is honored with a place on many important committees, such as employes, public utilities, state institutions, cities of the second class, and agriculture, of which latter she is secretary. Mrs. Minnich believes that each member of the House should for the most part confine his activities to forwarding the interests of the section he represents. The bills she has offered for passage have all been of this type. One, which has attracted wide attention, and which doubtless other sections will copy, is known as the Wellington Foundation Bill, and was passed without opposition. It provides for the lending of money by the city at a low rate to those wishing to build homes. Thirty such homes have already been completed since the bill was passed. Wealthy citizens have donated liberally to the fund provided for in the bill and the city is just finishing a successful $25,000 drive to add to it.

Mrs. Ida M. Walker, of Norton, is a newspaper woman. She is an associate editor of the *Real Westerner,* of which her husband, C. B. Walker, is editor. Her department, "On the Impulse," is widely quoted in the Middle West.

Mrs. Walker was born in a sod house in Western Kansas, in which section she has lived ever since. Thus she is a real westerner, imbued with the breezy, progressive ideas of the West. She began her career in her teens as teacher in the country schools. Later she taught in various city schools of her section. In her home town she has served on the local library board, as president of the city federation of clubs, and is now superintendent of the Methodist Sunday school. She worked faithfully during the World War in the various local activities. She is now serving her third term as recording secretary of the state W. C. T. U. She was president of the Kansas Federation of Woman's Clubs for two years. She organized a number of counties in Northern Kansas in Belgian and Near East Relief work, and is now state director of woman's work for Near East Relief.

Mrs. Walker has a keen mind and sound business ability, and serves on many important committees. Not a brilliant orator, she yet has the happy faculty of summing up the situation in a few words, in striking contrast to the jazz oratory so often found among men members.

Mrs. Walker mothered the State Bonus Bill, of which she is joint author, and which has won favorable comment over the state. It not only provides for the soldiers of the late war, but for the Spanish-American veterans as well.

Mrs. Minnie J. Grinstead, of Seward County, was elected in 1918 as the first woman member of the Kansas legislature. The male members, while scrupulously courteous, did not particularly welcome the innovation. They were afraid the woman member would be "fussy" and full of fads and isms. But the sound sense she displayed throughout the trying ordeal of her term as the only woman member, won not only for herself a warm welcome to her second term, but for her woman colleagues as well when they entered upon their first term.

Mrs. Grinstead is the wife of Judge Grinstead, former county attorney of Seward County, and now judge of the Thirty-fifth District. She has a wide grasp on public affairs. She is an ex-school teacher, a forceful speaker, a licensed evangelist, and has been lecturer for the National W. C. T. U. In the House she has never from the first sidestepped responsibility. She is active in debate and has introduced her full share of bills. On several occasions she has served the House as relief speaker. Although the mother of four children, who with her husband were in Topeka throughout her first term as legislator, and for whom she acted as housekeeper, she never once was missing from her seat at morning roll call.

Mrs. Grinstead's first campaign was full of thrills. She opposed one farmer, a real estate merchant, who had served the previous term in the legislature, and had proved to be "ferninst" every "fad or ism" that came up, and had voted "no" on every question save one—that of the segregation of Negro school children in cities of the second class. Mrs. Grinstead stood pat for every measure she thought right—and they were many, as might be expected from her previous career. She was elected on the Republican ticket by a small majority, but was given the second term without opposition.

Mrs. Grinstead holds almost the record for service on committees in the House, especially such as relate to welfare and reform measures, and is the only woman in the United States who ever served on a legislative judiciary committee.

But all has not been clear sailing for these women members on the legislative seas. Mrs. Minnich has found herself between two waves. Backed in her campaign by the Railway Brotherhoods, they are now protesting more or less mildly against the firm stand she has taken for the industrial court. Mrs. Walker is particularly good at checkmating attempted put-overs in legislation, in which matter even guileless Kansas is not guiltless. This wins for her, of course, some passing resentment. Miss Cline is keen in debate and repartee, and no man likes to be worsted by a woman. Mrs. Grinstead introduced a bill making it possible for a married woman who might be hurt in an accident to collect her own damages, instead of the money going to her husband, as under the present law. This bill brought upon her an avalanche of letters, some in praise, many condemnatory. A woman from the effete East wrote: "For shame! Suppose I lived in Kansas and should hurt my hand while at my housework. I could then sue my own husband for damages."

The bill, being too advanced even for advanced Kansas, was killed.

Mrs. Grinstead also mothered the Girls' Dormitory Bill for state schools. In an eloquent plea for the measure, she spoke of the possibility of the allotment provided for covering the cost of a kitchenette for the various groups of apartments, in which kitchenettes the girls could make fudge. But the farmer members would have none of this "tomfoolery," and the bill was killed, whereat Mrs. Grinstead, in a fit of temporary discouragement, exclaimed, "Oh, fudge! what's the use?"

But on the whole, the Kansas legisladies look upon their work as well worth while, since it has many compensations to offset its trials.

Reducing Life Cost of Coal

The coal miner has the most hazardous of important occupations. Between two and three thousand meet death in the United States every year. Top, left—Special equipment to enter gas-filled mine. Center—Waiting at the mine entrance. Right—A coal miner. Below, left—Using the geophone, a listening device developed during the war, to locate the whereabouts of men entombed in a mine.

By ROBERT KENTON

IN 1907 Congress was economically inclined. A small-sized panic, as you may recall, was abroad. But the panic, while the greatest, was not the only big sensation of the year. In the coal-mining districts there was a series of disasters that stunned the country. In several of them hundreds of men at work below ground were killed at the same time. The public began to demand that Congress take cognizance of the situation. In May, 1908, the Geological Survey was directed to begin a study of the subject. The job was turned over to Dr. Joseph A. Holmes.

It was found that in mining, especially coal mining, human life was treated as valueless. Though from the beginning of mining operations, the work of digging coal underground had been the most hazardous of occupations, virtually nothing had been done to reduce risks taken by coal diggers. Nobody could tell how or why many disasters, like those later found to be due to dust explosion, occurred. No effort had been made to develop effectual means for rescuing entombed miners, or for properly caring for those who might be rescued.

Yet for years the holocaust of life in mining was perhaps greater than that in war up to that time. In 1907 every 144,000 tons of coal taken out of the mines represented one man killed in the work of getting it above ground. From 1896 to 1907, the annual average was nearly six miners killed for every million tons of coal mined. Between 1907 and 1912 no fewer than 33,000 men were killed underground in the coal mines of the United States. Several times that many, in addition, were injured. Our mining death rate was among the highest in the world, and it is far from being the lowest now.

Dr. Holmes' inquiries led into fields remote from life saving. One now rarely thinks of the United States Bureau of Mines as in the beginning a life-saving organization, but to a far extent it is that still. The Federal bureau which now does research work on every phase of mining and metallurgy grew out of Dr. Holmes' investigations that were instituted because of the shocks given public opinion by the series of mine disasters that occurred in 1907.

The bureau was established in 1910 and Holmes was its first director. Under it is one of the most striking humanitarian organizations ever set up by government, being that part of the bureau which still looks after life saving in the mines. While life risk is still high in the mining industries, and probably will ever remain high, there has been a reduction in the proportion of miners killed; and frightful mine disasters have been made much less frequent during the last several years.

The government has worked on the coal mine fatality problem in three general ways. One is by scientific study, another by giving practical aid in rescue work, and the other by means of propaganda.

The first involves extended researches into all the problems of mining. An experimental mine is operated by the bureau near its main laboratories at Pittsburgh, Pennsylvania, and therein are developed ways for buttressing mine shafts against cave-ins, in studying dust and testing explosives. The studies of dust have led to some of the most interesting developments in modern applied science. It was found that a large proportion of mine disasters was due to the explosion of small particles of coal floating in the air. They seem harmless, even when seen, but they possess a terrific potency. Up to a certain point the dust is not explosive. Beyond that an electric spark or lighted candle may cause the very air to take fire and burst so violently that the mine shaft is shattered. The studies thus begun have been continued by the Department of Agriculture with reference to other kinds of dust. It was found that virtually all kinds of dust are explosive. For many years mysterious explosions had been occurring in grain mills. Most of them were due, as in the case of coal mine explosions, to atoms floating in the air.

Many miners' lives have been saved by the studies made of the explosiveness of dust and in finding ways to keep tab on the treacherous atom.

Another serious cause of death in coal mines is gas. The dangerous gases usually have neither taste nor smell, and sometimes are not discovered until men fall over in the throes of death. One of the ingenious ways the mining bureau has evolved for finding dangerous gases in mines involves the use of canary birds as detectives. The birds are very sensitive to gas and when they come in contact with it they topple over at once. Most coal mine operators now keep canary birds among their equipment, and one is regularly carried on a tour of inspection through the passages in the mine. When it shows signs of sickness, it is a signal that the workers in the mine have just about time enough to reach open air alive. White mice are as sensitive as canary birds but as they have a habit of often feigning unconsciousness, they can't always be depended on to give truthful signals.

Bureau of Mines' studies of gases had much military value when we entered the recent war. Its gas experts started the organization which handled that phase of our war activities.

The Federal Government does not maintain rescue facilities at each mine. It has rescue stations in the mining districts and operates ten traveling rescue cars that go from mine to mine. Those facilities are largely for propaganda and educational use. They are often employed, however, in actual rescue work. Experiments have been made in getting Bureau of Mines rescue specialists with government apparatus to mines via airplane and they have been successful.

What the Bureau of Mines specialists do chiefly is to inspect rescue equipment maintained by the mine operators, promote the adoption of the best equipment, and train volunteer miners in rescue and first-aid work.

Thus in the last ten years more than 100,000 miners have been organized into and trained in the work of rescuing and attending to their associates who may be caught in disasters. They are to the mines very much what the volunteer fire company is to the small town, except that they are probably better trained.

To encourage enthusiasm among the volunteer rescue and first-aid teams at the mines, an annual meet is held every year under the auspices of the mining bureau. Those meets are now international, Canada and Mexico being invited to send teams to compete for the prizes given those that prove most efficient.

The last meet was held in September, 1920, at Denver, Colorado, and the next one will take place next September in St. Louis. More than 100 teams from as many mines always take part in the meets.

Another incentive which has been provided is a special honor for miners who perform specially heroic feats in rescuing those who are endangered. It is in the form of medals issued annually by the Joseph A. Holmes Safety Association. It is a semi-private organization, for the government makes no provision for rewarding heroism in mine rescue work. At the Denver meet honors were given in six cases, and in three of them they had to be conferred on next of kin as the miners honored lost their lives in making rescues. One man, for example, was suffocated from gases from a mine fire after directing the construction of a barricade that saved the lives of eight other miners. One man, Jacob Delmarh, of Mullin, Idaho, was imprisoned in a cave-in for fifteen and a half hours while endeavoring to rescue two entombed miners, who, by the way, were reached and taken out alive after they had been held underground for more than fourteen days. James Collins was with Delmarh and also received a medal.

In addition to the international meets, state meets of volunteer rescue and first-aid teams are also held in the mining districts.

"No man is braver in time of need, or more willing to risk his life to save the life of another, than the miner," said Dr. F. G. Cottrell, then director of the United States Bureau of Mines at the last big meet of rescue teams. "In time of mine disaster it is never a question of who will volunteer to enter the zone of death. Such is the eagerness to respond that it often becomes the stern duty of some cool-headed foreman or miner to hold back the men while a few are selected to conduct the rescue work in an efficient manner."

The danger in rescue work has been lightened considerably by apparatus developed in recent years. The chief protection now given is a breathing machine. Members of a rescue party fasten it on their backs and over their heads. The instrument is filled with a supply of oxygen which the rescuers breathe while under ground. It is something like the gas masks used in the war. But the war gas mask is of little avail in mine rescue work, for it doesn't supply air, being only a filterer.

One spectacular war device now being used in mine rescue work is the geophone. It was used at the front in locating hidden batteries. With it a party of entombed miners able to make a noise can be fairly well located far from where they happen to be.

Experts estimate that attention to mine rescue work as promoted by the government during the past ten years has saved the lives of at least 5,000 miners. Yet in 1919 more than 2,300 miners lost their lives while at work in the coal mines of this country. During the first eleven months of last year nearly 2,000 coal miners were killed, nearly four men losing their lives for every million tons of coal taken out of the earth.

Our death rate in mines is still large as compared with that of most other countries, that is, when arrived at by the number of miners employed. As compared with the production from mines it is not so large, for the output per miner is greater here than in virtually all countries. This is due to our greater use of mining machinery. However, one man is killed for an average of 250,000 tons of coal mined in the United States; and it is said that one out of every six miners employed here is injured or killed every year.

"There is perhaps no other industry in the United States that has such life hazard, and there is none other to which the government gives such full attention to the saving of life," says an official of the Bureau of Mines.

Disarmament and Peace

Concluded from page 1

these burdens until it is demonstrated beyond peradventure that no understanding can be had and that therefore we are compelled to build as a matter of security and safety.

Let me say, too, and particularly to those who are very technical with reference to the disarmament idea and proceeding, that if we do not demonstrate to the American people that we have endeavored in good faith to secure a partial disarmament or complete disarmament, and that we have failed, and that therefore there is no alternative left except, as a matter of security, to build a greater navy, they will send a Congress here which will cut the appropriations regardless of whether we have a contract or not.

Of course, there are two ways to defeat disarmament.

One is to oppose disarmament and present the arguments against it. There are those who sincerely believe that we cannot afford to disarm, even under an agreement, and with them I have no quarrel, although I differ with them. They have their own reasons and they act upon them. There are others who are unwilling to say that they are opposed to disarmament; they are perfectly willing to pay lip service to disarmament, but they conjure up all conceivable methods for delay, which is another way of killing the program.

There is another proposition connected with the suspension of the building program, and that is the question that possibly in the near future we may arrive at some understanding with Great Britain and Japan with reference to the building program of the future. I want above all things to see an agreement with Japan and England which will enable us to cut down our burdensome expenses. If that cannot be had, then I want to see the most efficient navy possible for the money which we put into it. Both these propositions can be carried along together, and both should have prompt attention and prompt action.

I am not one of those who believe in a weak navy or a small navy, unless our security can be arranged through undertakings or agreements which make us equally safe. I presume everyone, however, whether he is for a large navy or a small navy, would like to know whether the navy is to comply with the standards which the best investigation and thought declare to be an efficient navy.

We certainly do not desire to build to the extent of $640,000,000 and then find ourselves in 1925 with an obsolete navy. I am informed that the agricultural appropriation bill carries altogether $33,000,000. That is $7,000,000 less than the cost of *one* of these possibly obsolete battleships, of which there are to be sixteen, costing about $40,000,000 apiece now. We should know as definitely as it can be known before we continue this program, that it will bring us an efficient navy.

Some time ago I offered a resolution which had for its purpose the bringing together of the three great navy-building nations, with a view of securing, if possible, an understanding by which the building programs might be reduced. There seems to be an opinion in some quarters that that matter ought to be delayed for a time. If it should be delayed, then it seems to me extremely important that we know something of the condition of our building program and as to whether or not it is along the lines which will make for efficiency in case we should ever be called upon to make use of the navy. Some of the great naval experts of the world now contend that what is known as the capital ship, or the battleship, will be practically useless in future naval warfare. Of course, I do not assume to pass an opinion on any such question, but it does seem to me that a layman may feel keenly interested in knowing what the ultimate judgment of the experts is to be upon this subject.

It is conceded that we are building the most expensive kind of navy which we could possibly build. The question is, is this expensive navy also an efficient navy? Unless ultimately we can arrange, through agreement, to curtail the expenses of naval armaments, we shall want a thoroughly modern navy.

I have never suggested doing away with capital ships. That is a subject for investigation. Some great authorities do believe that they ought to be abandoned. I have not suggested it; but I believe it is the part of wisdom for us to stop our building program until we can know what we are spending this money for, and whether we should put more money in capital ships or less, more money in submarines or less, and how we should round out and make a whole, modern, effective fighting navy.

I am frank to say that I do not think we have given sufficient consideration to this question. In saying that I am not criticizing those who have studied it in the Navy Department, but as a general proposition it has not been sufficiently considered by the people of this country.

If it should transpire that the most expensive navy is also the most inefficient navy, it would constitute a double crime upon the part of Congress to proceed with the program. It would not only be an offense against the taxpayers of the country, but it would be a crime against the people of the country in purporting to give them security which it does not give.

I desire, therefore, first to make every possible effort by agreement to reduce and cut out the competitive naval building program of the great powers. I would like to hear, both from Great Britain and Japan, about this reduction. If that cannot be done, I desire to have a navy that is in every sense a modern navy and an efficient navy. What we possess in the way of a navy must be the navy of the last best thought in the world.

I have not advocated that the United States shall disarm unless she can have an agreement with other naval powers to disarm. I am not proposing that the United States shall build an inefficient navy. What I am trying to get is the best minds of the country upon the question of what constitutes an efficient navy.

Congress is responsible for the expenditure of vast sums of money for the national defense, and it should have the best information possible as to whether they are being wisely expended. The information with reference to the subject in this country is very meager. I happen to know that there are men in the navy who believe that the capital ship will no longer be serviceable in modern warfare, but they do not feel exactly free to give that information under present conditions, unless they are called upon to do so.

The English cabinet have taken up this question, and they are dealing with it with their usual foresight and vigilance. They have decided—with the hearty concurrence of the admiralty—that the committee of imperial defense shall "institute at once an exhaustive investigation into the whole question of naval strength as affected by the latest developments of naval warfare." The British Government will therefore present no program to Parliament for capital-ship construction until the results of this inquiry have been considered.

I understand that that now is the settled policy of the English Government—to know thoroughly, and as conclusively as it can be known, what the revealments of the war are with reference to what constitutes an efficient navy. In that country, a country which for 200 years has dominated the sea, it is deemed wise to make haste slowly, not only in the interest of the taxpayers, but in the interest of an efficient navy, and, above all, in the interest of that continued control of the sea so vital to her existence. That government, therefore, has deferred all building for six months and set its experts to work and asked for the fullest and freest expressions from all students on the subject. In England they still have freedom of speech in the navy, and many of the best men in their navy contend that the navy as it is now proposed, or has heretofore been proposed, is an obsolete navy.

I would like to say here that if there is any way under our bureaucratic system of government to release the members of the navy to an expression of their real views on this subject I should like to have it done. I know there are men high in the service of this country who have long been connected with the American Navy who feel that the expenditure of money upon these battleships is a waste of money. If we could have the same freedom of discussion that is taking place in England upon this subject I think we would be able to arrive, possibly, at a sound conclusion, and I doubt if we shall ever arrive at a sound conclusion in any other way. A layman may have his views about it, but we must have the unbiased and uncontrolled view of those who have made a life study of it. They must be permitted to say what they think without being brought to task for doing it.

The information that is necessary and useful to have as soon as possible relates to the practical result of suspending naval building operations at this time. I do not know whether it is practical or not. I think it is, but full information is essential.

Partial or complete disarmament, if it is to come, and I hope it will, must be through the joint and sincere effort of the nations now bearing the greatest burden of navy building. Disarmament, or the reduction of armament by whatever arrangement it can be consummated, has no bearing upon the efficiency of the navy, and so long as a building program is in order, even if limited, it should follow the plans dictated by efficiency and common sense.

Occasionally one hears or reads that the United States, free as a nation from many of the political troubles that beset other countries, should be the first to disarm, an example that "would be gladly followed" by other powers. This view has led to many misunderstandings. The fact is that the United States cannot take the first step unless this step in a sane direction is taken by the other powers. The efficacy of the disarmament program lies in its acceptance by several nations; the more the better.

Europe is still Europe, with all her racial antipathies and imperialistic appetites, with the same standards of government, whatever name the government may bear, and the same strange conceptions of right and justice, in whatever terms she may clothe her schemes of ambition.

Mr. Lloyd George, in his campaign in 1918, declared that he stood for "the abolition of conscript armies in all lands. Without that the Peace Conference would be a failure and a sham. These great military machines are responsible for the agony the world has passed through, and it would be a poor ending to any peace conference that allowed them to continue."

That declaration was made after the war had closed and when the dawn of a new day seemed to be breaking and when he was seeking a special authority from the people of his country for the purpose of inaugurating a new world condition of affairs. It came very near being the first declaration toward disarmament. Four years or so ago President Wilson said that the "freedom of the seas is the *sine qua non* of peace, equality and co-operation," adding that "it need not be difficult either to define or to secure the freedom of the seas."

These statements concerning two elemental principles of world peace were made by men who were in a position to know, whose experience justified them in making them, and who were in a position to carry them out. They went so far as to declare that without their being incorporated in the Treaty of Peace or in the Covenant of a new world all the work of peace would be in vain.

Yet the freedom of the seas remains precisely where it was before the war, and conscription is a thing not only unchallenged by the Peace Treaty, but made absolutely necessary if the League of Nations—based upon the combined military force of four or five great powers—shall continue.

Wilson and Lloyd George stood in a position, if ever they intended to initiate the disarmament movement, to initiate it at Versailles, yet there is no intimation of any disarmament program in the treaty or in the Covenant of the League of Nations.

The program of disarmament, if it is to be made feasible, must grow out of a sincere and joint desire of the various governments to get together and disarm. It is a joint duty. Let me be fair and say that I do not think that Europe can yield by itself. I do not know that it is possible for her to yield. On the other hand, has not the United States, in so far as she has gone, accepted the policy of Europe?

If we assume the task of effectuating a change, we must do it upon the same basis as the past—by whatever power precept may exert.

The first step has been taken.

Your Own United States

This pile of stone might be what was left of any old barn, but it is the ruins of a tavern in old Kingsport, Tennessee, where Andrew Jackson, James K. Polk and Andrew Johnson, Tennessee's three contributions to the presidency, each stopped on the stagecoach journeys between Washington and their homes in the state of Tennessee.

What Machinery Has Done for the Farmer

By AARON HARDY ULM

This is the fifth of a series of articles by Mr. Ulm on farm life and farm management.

WE FIND, as stated in a previous article, the report of the United States Department of Agriculture for 1866 eulogizing farm machinery as if the acme had been reached in the development of labor-saving devices for rural use. But not until thirty-odd years later was the real epic of farm mechanics sung officially, and then by a government bureau not attached to the agricultural department. About 20 years ago the United States Bureau of Labor Statistics put forth the most striking figures extant on what machinery does for food production.

In 1830, the report pointed out, it took 64 hours and 15 minutes of man labor to produce an acre of wheat, the labor cost being $3.71. In 1896, the report claims, it took only two hours and 43 minutes, at a labor cost of 60 cents, to produce an acre of wheat. In 1830 it took 66 hours and 15 minutes of man labor at the cost of $3.73 to produce an acre of oats; in 1893 it took only seven hours and six minutes, at a labor cost of $1.07, to do the same thing.

From 1855 to 1894 the human labor time in producing a bushel of corn, says the same report, decreased from four hours and 30 minutes to 41 minutes. In 1830 a man had to work a total of four hours and 30 minutes in producing a bushel of wheat, while in 1894, it took only 10 minutes of man work to get a bushel of wheat. The labor cost in the case of wheat, says the report, fell from 17 3-4 cents to 3 1-3 cents in the same period of time.

In 1880 the average number of acres cultivated by each farm worker in America was 23.3; the number rose to 31 by 1900, and the value of each worker's annual product rose from $454.37 to $286.82, that is, an increase of about 60 per cent due to labor-saving machinery.

Even with cotton, which hasn't been helped by mechanical invention so much as other staple products of the farm, the labor time required for producing 1,000 pounds of unginned lint fell from 167 hours and 48 minutes in 1841 to 78 hours and 42 minutes in 1895. In the realm of grain production the effect of man labor aided by machinery increased during a period of about a half century from 150 per cent in the case of rye to 2,244 per cent in the case of barley, says one investigator.

Although the foregoing figures have been used frequently without reservation by authoritative writers on agriculture, it is fair to say that their absolute accuracy is not accepted by many farm economists of the present time. However, the approximate accuracy of most of them is not disputed.

Since the figures were developed, the advance in labor-saving farm machinery has been almost as phenomenal as during the period covered by them. For when the statistics were worked out, there were virtually no tractors, no motor trucks, or few combines for harvesting wheat. Though today it is possible to do all the work of planting wheat by a single operation and all that of harvesting by another operation—immense machines being used in each instance—a farm economist tells me that he estimates the normal labor time given to the production of an acre of wheat at about 10 hours.

Statistics dealing with such phases of farming on a national scale after all must be more curious than informative, as the best labor machinery can be or is used in only a small percentage of total operations having to do with any big crop.

Theoretically speaking, machinery has done as much for the farm as for the factory, though there may be a substantial practical difference.

The effect of farm machinery on the national economics of farming can be best illustrated perhaps by some figures on population and farm production. In a period of 30 years the following rate of increases took place:

Population	175%
Number of farms	260%
Cattle	185%
Swine	66%
Bales of cotton	201%
Bushels of corn	257%
Bushels of wheat	389%
Bushels of oats	411%

The period in question ended with 1889, and no doubt even more striking increases in farm production as compared with growth of population have occurred during the succeeding thirty years.

Machinery may explain the growing divergence between rural and urban populations. It is taking fewer and fewer persons to provide food for all the people.

A circumstance one who is saddened by growth of the cities at the expense of agriculture often fails to recognize is that the city man may often render a greater aid to farming than is given by the actual farmer. Men who build harvesting implements and tractors that whack farm labor needs into driblets as compared with those of the hand or hoe farming era assist mightily in improving the economics of food production. The point that the writer wishes here to make is that labor-saving machinery has served or may serve farming just as much as any other industry. To what extent the economies resulting from it have benefited the farmer equally with the non-farmer is a question of doubt, though the answer probably favors the non-farmer. Everybody knows that labor-saving machinery has cut the hours of labor and raised the standard of living in cities. It has also helped to raise the standard of living in the country, but perhaps to not so great an extent as in the cities. It has probably done much less by cutting hours of work in the country than in the city. But the disadvantages labor-saving machinery has carried into city life are a less pronounced accompaniment of its advance in the country. The labor-saving machine on the farm has tended less to make a machine of the farmer than it has done with regard to the city worker. Though it has promoted big farming, the effect there has not been nearly so great as in industry. While labor-saving machinery may have benefited the farmer less than the city resident, it certainly has not penalized him nearly so much.

Many people are prone to forget what mechanics have done and—much more important—what they may do for farming and rural life.

A recent farm survey made by the Department of Agriculture showed, for instance, that in one notable agricultural state more than 92 per cent of the farmers have automobiles, and that for all the western states 62 per cent have cars. In several states telephones are more common on farm than in city homes, having a prevalence of nearly 100 per cent on the farms of a few states, and 72 per cent for all the farming West.

Few cities will show as good rating for either automobiles or telephones as the farms in perhaps one-half the states of the West. And both are more labor-saving devices than they are in the cities, particularly if we include only home telephones and "pleasure cars."

A great many people maintain the impression that those living refinements supplied on a community scale in urban communities are virtually unavailable to the country, where vast waterworks systems, electric lighting plants or gas plants cannot be maintained by local government or big corporations.

There are farming communities in this country where every home is equipped for and enjoys electric lighting. There are others where every farm has a waterworks plant.

The survey already mentioned showed that there is running water in nearly one-third of the farm homes of the North and West, while running water is in at least the kitchen of virtually one-half the homes. More than one-half the homes have washing machines and nearly one-half have carpet sweepers, while 95 per cent own that first of all household mechanical conveniences, the sewing machine. And if you think the average farm house is the fly-haven that it used to be, note that the survey disclosed the pleasing fact that the windows and doors of 96 per cent of farm homes in the North and West are screened. Bathtubs were found in 20 per cent of homes, which is probably a higher rating than some cities can show, certainly higher than any city could claim thirty years ago, and far higher than European cities can boast of now.

If one turns the pages of a first-class farm paper, it will be seen that the biggest ads therein usually relate to mechanical comforts and conveniences that a generation ago were not thought of in connection with farm life.

"It would not pay the manufacturers of such products to advertise in farm papers if they were not selling goods of that character to farmers," the Secretary of Agriculture said not long ago.

The Department of Agriculture has made many studies of mechanical conveniences for the farmer, both in cultivating his fields and enlarging the comforts of his home.

Those studies show that the farm home, in a mechanical sense, can be equal to the city home, with all the peculiar advantages adhering to the country in addition. And they show that a great many of them are.

Of course, the city man doesn't have to make much initial investment in such things as waterworks and lighting plants, as the countryman must do. These initial investments are the chief influences that hold back big mechanical improvements in the country. It is relatively easy for the farmer to buy land, which he can get usually on long-term credits predicated on the land paying for itself out of what it produces. This has abetted the natural appetite of the American farmer for land, ever more land—an appetite which many students of farm life think should be restrained and directed toward making best possible use of land. The farmer without much cash can't easily get the equipment for waterworks and lighting plants on long-term credit. Movements are under way looking to the solution of that and other credit problems having to do with rural life advancement. Big business might find it highly profitable to work out means by which farmers may purchase important household conveniences and perhaps costly farm equipment on long-term payment plans whereby they could "pay for themselves" as land is expected to do. For those things can be just as helpful to profit-making farming as land.

"The lack of conveniences on the farm is not nearly so distressing a fact as the presence of conveniences is a fact of hope," says Professor C. J. Galpin, the rural life specialist in the Office of Farm Management of the Department of Agriculture.

If one wants to stretch the imagination the day can be visioned when animal power will be an unknown quantity on the American farm. The census of 1920 is disclosing a large decrease in the farm horse population as well as in the number of horses in the cities. There are probably more than a half million tractors on American farms at the present time. The distribution during the last several years has been at the rate of 150,000 to 200,000 a year, and during the last year it was not so large as was anticipated. Many thousands of farm trucks have displaced horses for hauling use. Gas engines are supplying power for varied farm uses, from cutting silage to running washing machines.

Mechanics give assurance that farming has passed forever the bumpkin and clodhopper era—the "hoe farming" stage as the students of rural life call it. But the beginner farmer, if wise, will approach machine farming with due care and caution. The tractor, for example, went through 20 years' experimentation before it proved its case by practical demonstration. But there is no question now, say the investigators, that the tractor is doing and will continue to do wonders for farming.

Another curious result of the studies of tractor farming is the fact that it hasn't yet produced the "horseless farm" except on a very limited scale. It merely reduces the amount of horse power that farmers must maintain. It was believed that in some sections it would boost the growing of horses, by making it profitable for farmers to maintain more brood mares. But this doesn't seem to have resulted.

There are now more than 10,000 motor trucks, many of them operated co-operatively, serving regular routes, say investigators. And of course many tens of thousands of trucks are used by farmers individually in marketing crops or otherwise expediting their work.

Because of the growing scarcity of arable land ready for cultivation, the time is approaching when increased food needs due to growth in population will have to be met in large part by intensive methods of farming that will raise the volume of production per unit of cultivated area. Machinery will be a great aid in facilitating intensive agriculture—a phase of farming that the beginner or the outside student can find well worth studying. In fact, land as mere land is usually given exaggerated rating in estimating the comparative values of all factors entering into farming.

Farm economists say that the use of land is only about one-sixteenth the cost of growing a potato crop, less than one-fifth the cost of an oat crop and only one-third the cost of even a hay crop. After all, the great factors in farming are labor, implements and intelligence. This doesn't mean that the land equation is negligible; its subordinate rating in the sum of total costs renders it all the more important that land be selected with the greatest care. For the product of labor applied to land grows in more than arithmetical proportion to the yield per unit of land to which the labor is applied.

"If an amateur hopes to make money by farming," says an authority, "he should go where the present farmers are prosperous, that is to say, where land is good."

The White Communists

Concluded from page 6

artist. More than that, over the piano in the visitor's reception room was a fine steel engraving depicting the first meeting of Herman and Dorothea in Goethe's story. This in a community the essentially celibate character of which a few years ago was stressed by absolute prohibition not only of books and pictures, but also of flowers and instrumental music or the wearing of a ring or brooch, as things likely to suggest the discarded and denounced passion of sex attraction!

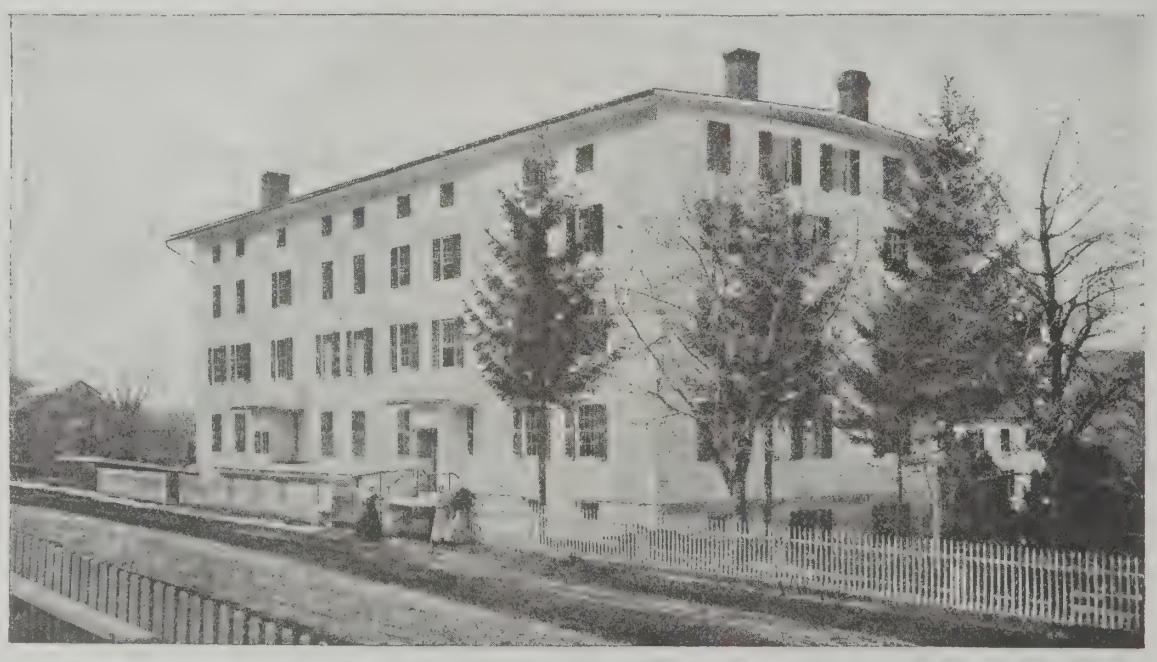
After lunch, the visitor accompanied Eldress Catharine on a walk through the village. The shops where Shaker cloaks, and "fancy" articles in the way of pincushions, bags and emery rolls for needles in the shape of big white and yellow daisies with green ribbon hangers were sold now bore neatly lettered signs. There were also on sale maple nut candies (made from maple sugar drawn from trees on the place, and nuts harvested in the neighboring woods). Big signs called attention to these wares also at points on the much-traveled state road. As we passed along, Eldress Catharine related brightly many interesting reminiscences of famous and fashionable summer visitors from Lenox and Pittsfield and other Berkshire resorts. The dignified and serviceable Shaker cloak of silver gray or tan broadcloth, lined with cherry or plum colored silk, was years ago made a fashionable driving and motoring garment by the example of Mrs. Cleveland and Mrs. Payne Whitney. Mr. and Mrs. John D. Rockefeller, Jr., visited the Shaker shops on their wedding journey and his bride selected a number of inexpensive fancy articles as souvenirs. The souvenir which the young Standard Oil millionaire carried away was of quite a different sort. Eldress Catharine commiserated him generously on the burden bearing imposed by his wealth. But she also very straightforwardly held up to him the sin of cruelty in the docking of the tails of his four coach horses. Moreover, she suggested that a great business man like Mr. Rockefeller might be expected to show more appreciation of economy and efficiency than to take four big horses to pull a carriage containing two small persons. On departing he told Eldress Catharine that she had "given him something to think over."

The Shakers are ardent supporters of the Humane Society and are actively associated with the Universal Peace Union and the International Council of Women. Probably the most notable characters since the founder, Mother Ann Lee, that Shakerism has produced were the late Elder Frederick W. Evans and Eldress Anna White. With his brother, George Henry Evans, associate of Horace Greeley, father of American land reform, an ardent abolitionist and champion of equal rights for women, Frederick was a friend and helper of Robert Dale Owen and Fanny Wright in the wave of Fourieristic communism which was then sweeping over the United States in the thirties. The Brook Farm Community, in which George P. Ripley, Charles A. Dana, Margaret Fuller (Princess Ossoli), and George William Curtis were leading lights, was, perhaps, the one brilliant historical outcome of this movement. Commissioned to travel and investigate the matter of location and the surest permanent foundation for a communistic society, Frederick Evans came into contact in Philadelphia with a noted Shaker, Abel Knight, who converted him from materialism to Shakerism. That was in 1831 and from that day until his death in 1903, Evans lived at Mount Lebanon, becoming during the last half-century of his life Shakerism's chief apostle and exemplar.

Eldress Anna White came of an old Quaker family on both sides. An ancestor was one of the founders of the city of Hartford, Connecticut; an uncle, Chandler White, was associated with Cyrus W. Field in the promotion of the Atlantic cable and a brother, Cornell White, was the founder of the Day Line of steamboats between Albany and New York on the Hudson. In joining the Shakers she renounced a considerable fortune and devoted to the cause of her faith and her people rare literary and administrative gifts.

In the following November, Eldress Anna, accompanied by Sister Sarah Burger, presented the resolutions adopted at the Shaker Peace Conference to President Roosevelt at the White House. An eyewitness thus describes the occasion:

> "The interview was unique as the two strong characters met face to face. In that most virile and forceful of men, that most spiritually forceful of women, was a subtle quality in common. Eldress Anna found Roosevelt 'a much better looking man than she had expected.' She referred to the fact that the Shaker Order was coeval with the Republic and to its consistent peace platform for over 130 years. Without ever having taken part in political or party strife, Eldress Anna affirmed that the Shakers had been among the best citizens the Republic had ever had and she spoke appreciatively of the President's recent Thanksgiving Proclamation, which she regarded in its noble language, as in its spirit, as 'sound Shaker doctrine.' The President gracefully acknowledged this tribute. His eyes never wavered from the face of this Shaker eldress of 75 years, nor did her gaze flinch from his steady, piercing look."



Roosevelt's reply to the address and the resolutions has timely interest just now as conveying pointedly his views on the great question of disarmament. He said:

> "I cordially agree with the spirit of the resolutions, but do not believe that disarmament under the existing circumstances of the intercourse between nations is practicable, although I favor very strongly enlarging and amplifying the powers and jurisdiction of the Hague Court of Arbitration, in reference to the submission of questions to that tribunal for decision. I feel that it is more important to eliminate the causes of war than to diminish the existing armies and navies of the different nations. I consider that it is better that a nation should engage in war than to submit to injustice and the imposition of wrong upon national honor and interests. Justice before Peace! My general sentiments are strongly in favor of the spirit and purpose of the resolutions adopted last August, and I am much obliged to the sisters for traveling such a distance in this weather to present them for my consideration."

May Wright Sewall, in a contribution to the memorial volume published after Eldress Anna's death, wrote: "I had thought of this community as safely islanded within its own interests and ideals. After my visit it seemed to me rather a tower for observation, and its head the keenest and clearest-eyed of observers.

It was of such incidents—surprising enough from the viewpoint of the Shakers as I had known them, yet entirely in line with the courageously progressive mentality of Eldress Anna—that Eldress Catharine and the visitor chatted as they walked through the spacious brick dwelling house of the Church Family in which she is now at home. There were books everywhere and in the windows flowering plants, while portraits of the loved and venerated leaders of the Order adorned the walls. It seemed that nearly twice as many women as men remained among the community's survivors, and, toward the last, Eldress Anna White had bravely faced the possibility that the business and financial administration, always confided to the brothers hitherto, might have to be taken up and carried on by the sisters alone. The type of woman developed by Shaker life and training, she was confident, would show a capacity for business management not inferior to that of mere man. Indeed this has been shown by Eldress Catharine's recent effective blocking of the scheme to turn over Shaker acres to the state of Kentucky.

Ciceroned still by Eldress Catharine, THE DEARBORN INDEPENDENT man revisited the meeting-house, this time being privileged to visit the upper story in which the members of the ministry formerly attended invisibly the Sabbath meetings held in the main auditorium below, seeing and hearing through a grille. This building, erected about ninety years ago, is remarkable as having the largest arched ceiling, unsupported by pillars, in the United States, next to the Tabernacle in Salt Lake City. Formerly the brothers and sisters from all five families in the village gathered here every Sunday morning for worship and there were also often many visitors from the outside world. Both the architecture and construction is the work of olden-time Shakers who were often most ingenious mechanics. They were the first to make wire nails and to revive the lost art of Pompeii by putting up fruits and vegetables in tins. They originated the making of corn brooms and the putting up and sale of garden seeds. I was shown chairs and rockers strong and comfortable, yet light and conveniently carried about, which have been in constant use for forty years and yet seemed as good as new. For five or six years past the production of this hand-made furniture has been discontinued—"because of the inability of the communists to meet the competition of machine-made furniture," the Shakers will tell you. But remembering the success with which Elbert Hubbard's people at East Aurora, the Acadians in Louisiana, and the arts and crafts societies all over this country are carrying on the making of beautiful things for people imbued with something of the gospel of the beautiful in the common life so valiantly practiced and propagated by William Morris and John Ruskin, one must conclude that it is really lack of members of the same character and skill as those that formerly made Shaker workshops busy hives of industry that is back of this falling off. Meantime, the knowing ones are availing themselves of the opportunity to obtain specimens of this Shaker handiwork while they last.

The North Family dwelling house at Mount Lebanon, N. Y.

Animated from the very first and continuously of the "gathering" of men and women in thousands to the "Millennial Church"—as the Shakers term their organization—they provided well ahead for anticipated increase of numbers. Despite the fact that a score of big farms and commodious and comfortable dwellings, barns and workships have been sold off in the last few years, there still remains in possession of the Central Society at Mount Lebanon a sufficiency of such land and buildings with furniture and equipment to provide homes and pleasant and wholesome work and living for at least 20,000 men and women. Manifestly, it is contrary to Shaker industry and economy—to say nothing of modern "efficiency"—that a plant capable of caring for 20,000 people should be kept up for the pleasure and comfort of only 500. Such an "overhead" involves shameful waste, of course.

The decrease in numbers, naturally, is a very tender subject. Brave and devoted little Eldress Catharine was disinclined to go into detail on this subject. "As Eldress Anna White often declared," she said, "there are more Shakers in the world today than ever before." She meant that many principles for which the Shakers stand have permeated the churches.

Elder Frederick taught that the communal life was only made possible by the utter extirpation of human selfishness, and that this extirpation was impossible except through strict celibacy.

As a matter of fact, the Shakers have for years more or less consciously recognized the great Swedenborgian idea of "discreet degrees." Many "world's people" known to be in sympathy with Shaker principles are regarded as associate members, while continuing to live outside the communities and in the marriage relation. Within the community itself, there are novitiate members, eldership and ministry. And there have been thinking men and women among them who have perceived a solution of the membership problem in an enrollment of an "outer court" in what Shakers regard as "the natural order," as compared with the "divine order." Without any least surrender of conviction as to the "rightness" for themselves of the celibate life, there is no reason why non-celibates should not be taken in—those who had graduated from the "natural" into the "divine" order retaining the control and direction of the order. Men and women enrolling in the community's outer court would, of course, be likely to be a selected class; the law of natural selection operating in the attraction of those sincerely seeking to live the spiritual life, and so to a great extent furnishing a recruiting ground for the higher degrees and fitted for leadership.

These reflections were irresistibly suggested by the inspection, under Eldress Catharine's guidance, of the old meeting-house. I examined with admiration the ingenious arrangement of curved joists on which the arched ceiling was laid and the manner in which these curved joists were securely fastened by means of hand-wrought iron bolts and nuts to great oak transverse beams, all in such a manner that the very pull of the ceiling's weight only strengthened its structure. And this arrangement in the roof had its counterpart in deep and solid rock masonry foundations in the basement, all nicely calculated to last for a thousand years, and sustain not only the walls but also the superimposed weight of the arched roof.

"Then you have abandoned this historic building?" Eldress Catharine was asked.

"Nay," she replied, a bright smile lighting up her pale face, "we long ago learned that the prophecy of Mother Ann that the Order should see alternative periods of rest and activity, eclipse and emergence, is in accordance with what Herbert Spencer called the law of universal rhythm. Just now we are in eclipse, so to speak; we are in that dark hour just before the dawn. So we lie fallow. But you will understand from the fact that we have just had the meeting-house repainted at a cost of $1,000, and the roof renewed at a cost of another $1,000, that we regard ourselves as stewards for the thousands of consecrated men and women who are to come after us. We shall not fail in our trust as conservators of Shaker wealth, spiritual and material."

Although strong pacifists, the Shakers "did their bit" in the nation's war crisis. They co-operated with the Red Cross in furnishing bandages and other supplies for the wounded, and they contributed liberally to all the big "drives" for war auxiliary work. It is not easy to believe that this development and all the conservation of energies represented in the Shaker system can go for naught. What part will it play in this era of human reconstruction?

Hatching the Fish That We Expect to Catch

Requires More Patience Than Waiting for a Bite Says Man Who Feeds a Million With a Feather

By EARL CHRISTMAS

THE man with a million babies! Yes, millions of them. Think of it—a million babies or so to feed for breakfast! And not the tiniest infant in all the world demands the patience and tender care that these babies require of this mere man. Such is the man who runs a fish hatchery.

Take the case of Oliver W. Mix. Mr. Mix is the foreman of the state fish hatchery at St. Paul, Minnesota. Every year he turns out into the waters of Minnesota a total of some 65,000,000 tiny fish, part of a vast horde hatched yearly by the state to re-populate its lakes and streams. Last year, eight state hatcheries in Minnesota hatched and placed in the waters of the state some 258,000,000 fish. With its 10,000 lakes and numerous streams, Minnesota is one of the great fishing resorts of the country, and the extensive fish propagation work undertaken by the state is part of a program to preserve and develop this resource.

Many states have entered into the interesting and highly important task of raising fish to replenish the supply in their lakes and streams. Incidentally, they are doing the job faster and better than nature could do it. But few states have the possibilities for development held by the almost limitless waters of Minnesota.

Two hundred and fifty million fish—that's a staggering total when you try to measure its extent, and it is suggestive only of the amount of work involved, the amount of patience and care required being to the uninitiated quite as incomprehensible as the total.

The trout-hatching season is now at its height. While snow and ice cover the streams and the lakes, and fishermen are telling their stories about the winter fires, the fish hatchery starts turning out its yearly horde. Tiny brown fry, a half inch long, more or less, flounder about in the water at the hatcheries by the thousands, yes millions, the origin of uncounted delights for the men who follow the lure of the trout streams.

The hatchery over which Mr. Mix presides at St. Paul, the biggest in the state of Minnesota, turns out 5,000,000 trout every winter. In the spring, Mr. Mix will be hatching the pike perch, and doing the job better than nature could do it. That will add more millions to his yearly troubles, some 60,000,000 or 70,000,000.

And to all these millions of tiny fish, Mr. Mix must give his personal attention.

"It's just like so many babies," he said. "These trout here, for instance, begin coming to the top of the water for food when they are three weeks old. We plan to ship them out to the streams before that time, but often we are unable to do so. Then we usually wait until we have a carload ready to ship at a time.

"They must be fed when they come to the top. The sac or yolk of the egg remains attached to each little trout after hatching, providing food for the first three weeks. After that sac disappears, they begin coming to the top of the water for food, and we have to be on the job with the food.

"Just now, I am feeding only about 300,000. That isn't so bad. But sometimes I have to feed a million or so. There have been times when I had to feed the whole hatchery. You take a feather and feed them three times a day and—"

"But how many does the hatchery hold?" I asked.

"Something more than 5,000,000," he said.

"Feeding 5,000,000 fish with a feather three times a day—well, what would you do with your spare time?"

"Oh, I manage to keep busy during the hatching season," Mr. Mix continued. "We never would have to feed so many under the present plan, where we have our own cars, unless something in the way of a transportation tie-up resulted. Sometimes, when we couldn't get cars at the time we wanted them, we would find ourselves with large numbers to feed on our hands.

"Now, the state owns a special car, and the crews make the distributions more regularly. Sometimes, we might have to feed a million this way, but usually it would be around a half million or less.

"You take a feather and spread the food around over the water evenly, so that all the fish will get a chance. If you don't they will go to eating one another. If you don't spread the food over the water with the greatest care, many of the little fry will die."

Feeding several million fish with a feather ordinarily would commend the patience of any man, and not many women would be disposed to question its eloquent testimony. Sometimes before breakfast, however, Mr. Mix will count the tiny fish in one of the pans at the hatchery just to see if his estimates are running true to form. In one of these pans, used in the hatching of trout, there are 10,000 fry. The pan is one foot wide and about two feet long. Sometimes Mr. Mix finds he has miscalculated by 50 or 100 or sometimes by only 10.

Top—The eggs of the trout are placed in pans in running water. The eggs are about an eighth of an inch in diameter. Center—OLIVER W. MIX, who finds that running a big state fish hatchery qualifies a man for a medal when it comes to patience. Bottom—This picture shows a section of one pan of the tiny trout in the fry stage, about three weeks after hatching. Less than an inch in length, they are called fry; longer than an inch, fingerlings. Most fish are shipped from hatcheries in the fry stage.

Full of strange and interesting insights into the wonders of nature is the fish hatchery. For instance, if you should go down to a trout hatchery and find a man feeding his fish with a feather, you probably never would guess what he is feeding them.

The miniature trout, when they get big enough to eat, demand a diet of liver. And liver they get despite the high cost of meat. The liver is ground into fine particles and mixed with water. The mixture is spread evenly over the surface of the water with a feather, and the fish do the rest.

The tiny fish require from 50 to 100 pounds of liver a week, when about half a million are being fed. When the number is larger, the food bill at the hatchery becomes a serious item.

"But the tiny fry and fingerlings aren't the only fish that need meat," Mr. Mix explained. "The meat for the brood stock sometimes runs as high as $148 a month. In the summer, they eat 600 pounds of beef lungs and liver a week. If we stop giving them meat, the fish begin to disappear. You see, they eat the young and weaker.

"Even the little pike start eating each other if we don't ship them out soon after they hatch. I have seen a string of them, two or three inches long. One fish would try to eat another, and as the head of the little pike is comparatively large, it couldn't be done. He would get the job just about half finished, when he'd get stuck. Another hungry little pike would come along and try to eat the second, swallowing away at his tail until he, too, got stuck. Others would try the same thing, until there would be seven or eight in the string, all dead."

But feeding the fish isn't the only concern of the man who runs a fish hatchery.

"The water must be kept at the right temperature, and there must be a proper circulation of the water while the eggs are hatching," Mr. Mix explained. "If there isn't proper circulation, the little trout may be crippled. As it is, there are all kinds of freaks. Sometimes there are fish with two heads, some with three heads. Some are twins.

"The spawning season for the trout usually begins in October. It requires from 90 to 100 days for the eggs to hatch. The tiny eggs, stripped from the trout, are kept in little square pans in running water until they hatch. Running water is necessary, because the presence of air in the water is necessary."

When the fish hatch, they go into oblong pans in the long troughs of running water in the hatchery. In each of these pans, a foot wide and about two feet long, 10,000 tiny trout wiggle about while the white sac is disappearing from their bodies. If they begin to lose the precious sac of food too soon, a stream of ice water, turned into the trough, serves to check their growth while the railroad hurries its cars.

For the pike perch, with eggs much more numerous, a different system is used. The pike eggs are placed in jars. When the fish hatch, they come to the top, and flow off through numerous tanks and pipes into the shipping tank. The pike hatch in much less time than the trout, and must be shipped out at once, having no such three weeks' food supply as the tiny trout. So the pike hatching season, beginning usually some time in April and lasting a month, is a frantic rush at the fish hatchery. In that month, some 65,000,000 pike are hatched and sent out from the hatchery over which Mr. Mix presides.

Brook trout constitute the great bulk of trout hatched at the Minnesota hatcheries, though brown trout, lake trout and steelhead trout are hatched in lesser numbers. Pike perch, however, because of their more prolific nature, form the greatest part of the yearly production. Of the 258,241,323 fish planted last year, pike perch numbered 248,788,000, while brook trout numbered 7,041,096.

"Replenishing our fish supply is a task of tremendous importance," said E. W. Cobb, state superintendent of fisheries. "Minnesota and other states with good lakes and streams for fish might well spend two or three times as much as they do in this work. Our fish are just like our forests. We realize their importance after they are gone. Unless we pay greater attention to protecting our fish and propagating more, they will go the way of our great forests."

Anyway, while serving as a much-needed institution of conservation, the fish hatchery is a most interesting place. For instance, the hatchery at St. Paul has developed a species of white brook trout. With a beautiful white skin and lithe body, they skim through the darkened water of the pools, the cynosure of all eyes of the fish kingdom, you might imagine as you watch them dart here and there.

But this time beauty is a delusion and a snare. The white fish—"Albinos," they call them at the hatchery—have a very high visibility and a correspondingly high mortality. All their enemies can see them too well.

The kingfishers sit in a tree overlooking the pond, and when a white streak appears in the water below, dart like an arrow into the water, pinning the fish with their sharp bills.

Perhaps man wasn't so kind in developing a race of white fish. However, Mr. Mix has provided a covering for part of the pool where the Albinos live, and they can seek refuge there when the kingfishers get too thick. And a rifle helps keep the casualities as low as possible. All this and more falls to the lot of the man who runs a fish hatchery. Perhaps no other man handles the destinies of so many living beings, and he has the champion long-distance record for patience.

UNIVERSITY OF ILLI... APR ...

"Like a Bone to a Dog!"

THE actual situation today is one that makes the demand for disarmament imperative. More than two years after the bugles sounded "cease firing," the victorious nations are piling up armament on a stupendous and insensate scale. And the people pay!

Congressional grants of money for war purposes stand out in glaring contrast with the amounts appropriated for the constructive work of those departments of the government on which the real strength, prosperity and progress of the country so largely depend. Out of total appropriations of approximately SIX BILLIONS OF DOLLARS, it is proposed to spend some FOUR BILLIONS on war purposes, diverting this immense sum from the arts of peace: from our productive industries and the crying needs of economic reconstruction.

Peace is literally starved to feed the insatiable maw of the War Monster. Having, in actual war-time, sacrificed on the altar of this frightful fetish the flower of the nation's manhood and increased our debt by thirty billion dollars, we continue in peace-time to fatten its huge and horrible bulk with the nation's strength and substance, crippling our industries and burdening the workers.

Is it not time to call a halt; to turn from the way of militaristic madness to that of sanity?

Last of Mark Twain's

By HENRI

WHEN Mark Twain wrote about Hannibal, the Mississippi River, "the Tennessee lands" that he put to use as the scene of the opening chapter of "The Gilded Age," and about all of the other American localities that you find pen-pictured in his books, he honestly described their environment, and the people who were in it. Mark Twain realism was spread out there so that you could see it with half an eye.

But nowadays, with the exception of "the Tennessee lands," if you look over these places with the hope of finding very much that is as you read about it in the books, you'll be disappointed. Clear-cut living pages from the writings of Mark Twain are over and done with.

Even on "the Tennessee lands" the tide of civilization has not been kind to Mark Twain realism. But its work of obliteration has been hampered. It has had a good deal to contend with, so that speaking generally of that region, his realism is not entirely destroyed.

Until comparatively recent years, the whole of "the Tennessee lands" was a solid page from the opening chapter of "The Gilded Age." Located in the extreme north-central part of the state, in one of the wildest sections of the southern mountains, the tide of civilization could make no impression on that country when it first rolled that way a good many years ago. So the tide separated. It flowed around the haunts of "ol' Squire Hawkins," and Mark Twain's variety of highlanders in them, leaving the region marooned amid somber loneliness. There was no end to the flowering of outlandish beliefs and strange ways. They were rooted in a tangle of Irish banshees, Scottish highland habits, and customs and lore of the Spanish and the Dutch, brought into the mountain country by the very earliest settlers. Nothing from the outside came to blossom a hybrid among them, nor to make away with them.

But the waves of civilization continued to lap at the outskirts of "the Tennessee lands." One by one the inventions that "ol' Squire Hawkins" enthusiastically described to "Nancy" margined the edges of the lands. The steamboat alone has been delayed. The stream that the old squire said would be the carrier of traffic so far has obstinately refused to deepen its channel to accommodate any craft that draws more water than a rowboat.

A branch railroad from the main line on the eastern edge of "the Tennessee lands" is in course of construction into the heart of them. Civilization has thrown wagon roads across the country of the first chapter of "The Gilded Age" like Time carves wrinkles in the face of a woman. Some of these roads are good; some of them are very bad. Between the extremes you find the history of mountain thoroughfares, beginning with footpaths through the forests, and ending with highways that are paved with gravel. And there are a few resident automobiles that run on these roads.

Of course, the effect of these invasions of civilization has been to change the ways of thinking and doing of a majority of Mark Twain's people of the mountains, even far into the interior. These people no longer are "poor worms." And, at the same time, it is doing some unexpected things. Recently, it literally unearthed several scores of citizens Mark Twain failed to mention. They are the cliff dwellers.

Now, cliff dwellers in that country were not aborigines. The latter were driven out of the mountains so many years ago that their presence there is nothing more than tradition in the memories of the oldest inhabitants. The cliff dwellers there are strays from the white settlements, who wandered around until they found a place to live that suited their fancies. Following an age-old custom of the highland Indians, some of these strays inclosed open places beneath rock ledges with pieces of detached cliffs that were carried along by landslides.

They lived in these "rock houses." During the summer they raised enough corn in little clearings in the forests to feed them through the winter, and kept track of their droves of half-wild hogs that ranged the woods. When the urge to roam again became strong, the "rock house people" looked around for more open places to inclose. Other strays followed the easier Indian custom of locating caves, and fitting them up as habitations. However, the cave dwellers were looked upon as being an inch or two behind the "rock house people" when they were measured by the yardstick of civilization.

No one seems to know whether civilization floated to the cliff dwellers like fall tang does in the air, or what happened. They sensed it, whatever it was, and by couples and by families—but not all at the same time—they emerged from their caverns in response to it. When they got out into the open, these underground people housed themselves in log cabins. And they're taking to new ways like ducks plunge into cool ponds on a hot afternoon.

But on some of these former cliff dwellers civilization is reacting something like a fit affects a cat—it has induced kinky thoughts and wild squirms among them. There is, for instance, "Cynthy" Sellers. She lived in "rock houses" and caves for sixty-five years. On these lands that Mark Twain described you'll always find two books in every little cluster of cabins—a Bible and a catalog of a mail order house. The latter is the one that is most generally read by whoever is not illiterate, because the catalog gives a glimpse of what there is in the world that is locally known as "the outside." One day, some one ran across a wonderful description of an evening gown and a bathing suit. The story of what they were like was told, and it spread until it came to rest in the ears of "Cynthy." She sent "outside" for them.

As civilization came on, some of Mark Twain's people backed away from it. That is the reason you still can find a few undimmed living pages from his books. These people did not like new ways of thinking and doing, and they continued in retreat, until they were deep in the heart of things on "the Tennessee lands." In a valley over here, without warning, you'll step among three or four log cabins near to one another; off yonder, the only structures are a cabin and an animal shelter, nestling in the farthest back of beyond.

In these cabins, old men and older women live as their ancestors lived, in an environment that never has been violated since Mark Twain described it. In other isolated places are more of the likes of the characters who ramble in and out of the first pages of "The Gilded Age." They never have lived anywhere else.

These two sets of people are the only folk on the continent who reproduce in unchanged environment, and with actual characters, Mark Twain realism in their everyday lives. They are fighting hard in their coverts against extinction by the tide of civilization, and that fight has every appearance of being a losing one. When these places are wiped out there will be no other spots that are exactly as Mark Twain pen-pictured them.

And how do you find these places? Well, there is no direct route to any of them. There is usually no connection between them. They are just huddles, squatting haphazardly at the ends of overmodest trails that wibble-wabble across the country of "The Gilded Age." You start out on a hit-and-miss course along the brims of valleys that are wantonly embraced by sheer-sided, timber-bristling crags; through thousands of acres of virgin pine and hardwood forests, and along the banks of streams that set even the prosiest gadling to dreaming. After a while you'll come across a living page.

You can do this afoot, or aboard the broad back of a he or a she mule, to get into the details of the proceeding. While you may think that muleback is an ungainly mule that he owned. His moods reflected is the most satisfactory means. "The Tennessee lands" are not very much smaller than a minor European principality, and that is a lot of ground to cover afoot. And the mule has this advantage, it never persists in walking too near the edge of disaster.

It was for the lack of a mule, to digress for a moment, that you never will meet up with the original "Colonel Mulberry Sellers." He lived on "the Tennessee lands" until a few years ago. But the "Colonel" was fond of his moonshine beverage, and of an ungainly mule that he owned. His moods reflected the weather. When there were storms, and heavy rains made torrents of the mountain streams, the "Colonel" also went on a rampage. He took his capacity load of moonshine, and a bit more, mounted his mule, and set out to ride through every stream that was raging. And he did this, though the "Colonel" was a very old man.

When he rode the mule there was little likelihood of a mishap. But one afternoon the mule was not to be found when a heavy mountain storm ceased. So, the "Colonel" mounted one of his horses. The second stream he attempted to cross was a familiar one during high water to the mule, but unknown territory to the horse. It slipped in midstream, fell, and both the "Colonel" and his mount were drowned. But he was "Colonel Mulberry Sellers" to the last. When his body was recovered, in his coat pocket there was a handful of chippings from a lead mine that he had located on "the Tennessee lands," and which he expected would develop into a real money-maker for him when he got the time to get around to the job of opening it up.

"LEMON" SEXTON
Sheriff, who raised the dead and found the lost.

Not far away from the scene of the last adventure of the "Colonel" is the cabin of "Uncle Hi." It is well hidden from civilization, because he is a mountaineer after the pattern sketched by Mark Twain. The cabin is a two-room affair, and in it live "Uncle Hi," his wife, and two generations of their descendants.

I spent an afternoon and a night with this old man of the uplands late in the fall. Though it was a chilly afternoon, the door was open, as doors usually are in that country in all sorts of weather. "Uncle Hi" drew a cane-seated chair squarely into the center of the light from the half-cabin-width fireplace. That was my place to "set a spell, afore supper, hit's ready." The position threw the light into my face, so that it could be furtively studied. Mark Twain's folks are a suspicious set at any time.

There was little conversation. Highlanders in these living pages from the books of Mark Twain are not disposed to make very much talk. I had time to study the room. The walls were the unconcealed squared sides of the logs from which the cabin was constructed. The cracks between them were chinked with clay. In some places it had lost its grip, and fallen out and away. The floor was of boards, hewed from logs. There were some cheaply framed pictures scattered here and there on the walls. A half dozen chairs shared the floor space with two massive beds, one in the far corner of the room, and another in the opposite corner. The winter supply of sweet potatoes was heaped on the floor between these beds.

Occasionally, "Uncle Hi" stirred the fire with a tree branch. The logs crackled merrily, and popped

Clear-Cut Living Pages

De QUESTIER

enthusiastically. Presently, in high jinks of unrestraint, the fire splattered tiny embers that flew about like escapading leaves in a windstorm.

From the center of the fire a scrawny stick reared above its companions. A wee flame darted upward from the end, then retreated. No harm following its adventurous leap, the diminutive blaze took courage. It stretched higher and higher—an ambitious thing, oddly humanlike in its efforts.

"Uncle Hi" directed a stream of tobacco juice toward the blaze. By an uncomfortable fraction of an inch it missed the slender flame, which jumped back in apparent alarm, and winked out.

"Hit'll come back in a minute er two," he said, pointing with his right forefinger toward the end of the stick, "that 'ar leetle ol' blaze, hit will.

"Hit's a game down hyar, hit is," he remarked after he wiped his lips with the back of his hand, "fer t' set an' spit at them 'ar leetle ol' blazes, hit is. Th' wimmen, they like fer t' do hit better'n th' men. Hit gives 'em somethin' t' do.

"An' hit seems's ef them 'ar leetle ol' blazes, they like t' play hide an' seek with t'backer juice," he went on. "They'll jump in an' out, an' dare sumbudy t' ketch 'em, an' they'll keep hit up 'til th' whole end 'v th' stick, hit's afire."

A little girl in the far interior of "the Tennessee lands."

For a time conversation lagged. These lapses in talk give you plenty of time to reflect on the emptiness of the lives of Mark Twain's living characters from the opening chapter of "The Gilded Age." Imagine, if you can, being unable to read—for the most of them are illiterate; and having nothing to read but a catalog if you do know the alphabet. No town; no streets; no picture shows about you—just the wilderness. No amusement, except spitting at "leetle blazes." And nothing much to talk about, because you've been talked out of something to say for more years than you can remember.

Supper was eaten by daylight to save coal oil. The lamp never is lighted, except in emergencies. And the meal varied little from the majority of meals you get in these sheltered spots. There was corn bread—heavy slabs of it; what is known as "bacon" in the uplands—fat chunks of salt pork, fried in its own grease until that grease floated them in the bowl from which you picked your particular chunk; potatoes boiled; beans, and coffee that had the taste and the aroma of ammonia. In these sheltered spots, Mark Twain's people certainly never have learned to eat.

"That 'ar ol' baby 'v Goodle Sellers," remarked "Uncle Hi" some minutes after the meal was over, and perhaps ten of us were seated before the fire, "that 'ar ol' bratze 'v his'n, hit's got th' canker sore mouth."

"Shoe water's whut hit needs," replied his wife. "Hit's th' only thing which hit'll cure tham 'ar ol' cankers."

"When th' bratze's pappy, he comes in at night," explained "Uncle Hi" in response to an unasked question, "ef he'll jes' take his ol' shoes, which he's bin a-wearin', an' fill 'em with water at th' spring, an' let that 'ar ol' water soak in 'em, an' then empty hit out, an' wash that 'ar ol' bratze's mouth out with hit, why, that 'ar ol' shoe water, hit'll shore nuf cure them 'ar ol' cankers right up."

That moment a bevy of "leetle blazes" upreared in the fireplace. "Uncle Hi," his wife, and some of their older descendants, took up their spitting game.

Suddenly through the open door came skunk odor that was nearer to a vapor.

"Dill Mason's ketched a skunk fer hi'se'f fer th' chicken pox," remarked "Uncle Hi," without turning his head. The little blazes were playing a boisterous game, and there was no time to devote to anything else.

"Thar's a lot 'v that 'ar ol' chicken pox 'round hyar now," he later remarked at the end of the game, which resulted in a score of ten to one in favor of the blazes, "an' that 'ar ol' skunk smell, hit'll clear hit out, hit will. Thar won't be no chicken pox hyar in a day er two.

"Dill's bratzes, they hain't got hit yit, an' they won't git hit now," he went on, "fer he'll hang that 'ar ol' daid skunk over th' door. Hit'll keep away typhoid fever, er smallpox, er any 'v them 'ar ol' diseases, hit will.

"Yes, sir," continued "Uncle Hi" in a slow drawl, "that 'ar ol' skunk, hit will shet up any epidemic 'v any kin', ef y' put hit above th' door on th' outside. Fer them 'ar ol' diseases, they're jes' like a-hangin' a buzzard's tail feathers over th' door.

"Y' know, ef y' nail one 'v them 'ar ol' buzzard's tail feathers over th' door," and here "Uncle Hi's" voice lowered to a croakish whisper, and he peered through the door to see what lay beyond, "thar hain't no witch whut ever flew er walked, which hit'll go in under hit, thar hain't."

The silence that followed was broken by a solitary owl call. It echoed among the crags about the cabin. "Uncle Hi" heard it, and listened attentively. The cry was repeated.

"I'll jes' shet that 'ar ol' door," he said, and he hastily made good his intention.

Then, as if to change the subject, he quavered a song. It was an interminable thing, that detailed the unsuccessful efforts of a mountain somebody to draw milk from a brier bush. The words evidently originated from one of a dozen mountain versions of the Biblical story of the stone that was offered in the place of bread.

The owl call was the cause of the music. In these last of the living pages from the writings of Mark Twain, cries of night birds are heard as an evil omen. The belief is that they are prowling witches in disguise. When he heard it, "Uncle Hi" sang to keep up his spirits, like a small boy whistles when he passes a graveyard after dark.

For these people live always in horror of a visitation not only from witches, but also from "hants," a corruption of the word "haunts." They are malicious spirits of the dead, prowling around to bedevil the living in a hundred different ways. And the "hants" are a touchy clan. They resent loose talk about themselves, with strangers especially, and they take fearful vengeance by chasing night travelers for long distances. The "hants" gather in bevies, these mountaineers will tell you, and screaming and cawing like crows, they will, unseen but heard, corner individuals in lonely places. There in the midst of an unearthly hubbub they will beat these individuals until the life is nearly out of them. At other times they merely pursue those who have offended them—but the pursuit is nearly as trying as the beating, for it is a hard job to run for any distance up the sides of peaks, and down the other sides into depressions. While the pursuit is on, the "hants" utter their fearful cries. For these reasons, you'll seldom hear many tales about "hants," until you are well acquainted with Mark Twain's people in these sheltered spots.

And the worst of the prevalence of "hants" is that their numbers constantly increase. The rocky soil prevents the digging of deep graves. The coffins are flimsy affairs. Sometimes they are so scantily covered that their outlines are plain to be seen. They crack open soon after burial, "t' let th' hants out," the old women say, but between excursions over the mountains the "hants" can be found at home in their graves.

Partly as a protection against droves of wild hogs, who dig up freshly dead bodies, and partly as a mark of respect, newly made graves are surrounded with brush, and even with pretentious fences; and they are covered with structures of various kinds. Old Mark Twain highlanders say that these fences and structures provide "hant" shelters long after the coffins fall apart, and the graves are nothing but earth scratches. When the mood for making talk is on them, these old-timers of the uplands will spin long yarns that are filled with details concerning adventures with flocks of "hants," and especially about the whirring sound that they make, caused by their flights when some invader disturbs a shelter where they have congregated to plot mischief and devilment against the living.

But of witches you'll hear aplenty. They're not numerous. But belief in their powers is widespread. When afflictions of the most ordinary kind come upon families they are regarded as weird evils, rather than as natural consequences. Then the witch doctor is summoned to remove the spell, and he goes about his business in the most astounding ways. There are several witch doctors on "the Tennessee lands," and they are kept reasonably busy relieving distress.

Of all of these "hant" and witch afflictions that you're likely to hear, however, there are few that are not endenizened bits of fairy lore and monster stories, changed a bit, but showing that they are parts of Old World superstitions brought into the hill country by the early settlers. These tales have been wound one with another, and made to fit "Tennessee lands" localities, until it is not always easy to trace each story back to the nation from which it was brought into the hills.

It lacked a few minutes of half past six when "Uncle Hi" suggested his need for sleep. Bedtime comes early in these sheltered spots. He indicated to me the bed in the far corner of the room. That was the guest chamber, and the partition between it and the family bedroom was the heaped-up pile of sweet potatoes.

Soon eight persons, "Uncle Hi," his wife, and six he and she descendants of various ages, removed their shoes. The men unbuttoned their shirts at the collars; the women loosened their dresses at the tops, and without further preparation, one by one they crawled into the bed opposite my own. On that bed, as well as on the one I occupied, there was a tick fat with feathers to sleep on, and a duplicate of it to sleep under. The remainder of the family distributed themselves in the other room, which also was the dining room, and all was quiet.

And that is their life. Is it general on "the Tennessee lands"? No. It is modified to all of the degrees between this life and near-obliteration of Mark Twain realism over the country of the opening chapter of "The Gilded Age." These people are the exceptions, but they are exactly the kind of people who might have been Mark Twain's playmates, and later neighbors.

For "The Gilded Age" is but a history of the Clemens family. His father and mother owned these lands, and lived upon them, until the urge for moving took them into Missouri shortly before Mark Twain was born. Had the migration been delayed for a reasonable length of time, or not undertaken, Mark Twain would have been born into an environment and among a people precisely of the sort he pen-pictured. He wrote "The Gilded Age" largely from the stories of "the Tennessee lands" that his mother told him. She was honest in giving him her impressions, though they must have been a mosaic of disappointment to her. Years afterward he saw that country. Leaving it, and coming north on the railroad, he sat in the smoking car with one cigar alight between his lips, and another cigar in his hand.

"I'm contemplating this cigar," he said to his seatmate, "with a lot of satisfaction, and thinking how good it will taste when I light it."

7. A gossiping group in the highway through the country of "The Gilded Age."
8. You can camp on "the Tennessee lands."
9. All dressed up for visitors to "the Tennessee lands."
10. A "hant" shelter on "the Tennessee lands." Graves are covered with structures or surrounded with fences to prevent disturbance by wild hogs.
11. Single cabin and animal shelter where Mark Twain realism is nursed.
12. Where Mark Twain realism is vivid on "the Tennessee lands."

Inventing New Taxes

THERE was an Oriental despot once who made a standing offer of a handsome prize for the invention of a new tax. In pre-war Turkey, it would certainly require genius to think up a really new way of getting more money out of the pockets of the people and into the national treasury. This Sultan went on the simple assumption that the more the taxes the larger would be the revenue. But in actual practice it turned out that *as taxes were multiplied the revenue became smaller and beautifully less.* This, of course, was simply incidental to the decreasing wealth and productiveness of the people in proportion to the increase of tax burdens. With consequent discouragement of industry and enfeeblement of the poverty-stricken workers, even floggings this year, following the selling up of the peasant's cows and pigs and the mechanic's tools and garlic patch last year, failed to produce piastres for the Sultan's purse.

Oriental statesmen are slow to learn the unwisdom of killing the goose that lays the golden eggs. Are western politicians any wiser? Crude indeed is the political philosophy which seeks to solve the problem of providing increased revenue by inventing new taxes and piling up old ones, regardless of the effects of any particular tax on the country's wealth and prosperity as a whole. That was one fallacy of the era of high protective tariffs. The higher the tariff the lower fell the revenue, while the cost of living for the masses was increased out of all proportion to any increase in the average wages earned, and the whole system became a notorious source of political corruption.

Another flagrant example of this Turkish idea is the peace-time continuance of the excess profits tax, which was at first tolerated only as a temporary war emergency measure. Waking up to the fact that it is a drag on all business, and so a drain on the sources of revenue, our legislators now seem to be trying to think up something to take its place. One sapient suggestion is that of a capital levy; that is, the "lifting" of from 10 to 20 per cent of the total capital of the country from its present owners. Blindness is shown to the fact, apparent to any man looking beyond the end of his nose, that such a levy would seriously diminish the productive capacity of the people and stunt the growth of industry.

Another scheme which bears a suspicious family resemblance to this Turkish plan is suggested by a Treasury "expert," Dr. Thomas S. Adams, chairman of the advisory tax board of the department, and it is reported as likely to have strong support in Congress. This plan would place a tax of from 10 to 20 per cent on undistributed earnings of corporations. Dr. Adams favors the 20 per cent rate, which he calculates would yield about $190,000,000, as against an anticipated loss of $450,000,000 from the repeal of the excess profits tax. He also estimates that the additional revenue from the application of the surtax rates to "dividends distributed by the corporations *to avoid* the 20 per cent undistributed profits tax" would amount to $500,000,000, making a total of nearly $700,000,000 additional revenue which would be derived from this tax. Well, *a tax deliberately designed to provoke tax-dodging* as a basis for a surtax on the dodge would certainly capture the Sultan's prize.

Then there is Representative Bacarach, a member of the Ways and Means Committee, who favors a tax of one per cent on all retail sales. He also favors the Adams scheme, but thinks that 10 per cent on undistributed corporation earnings would be enough, if his surtax on sales is adopted. That means that the ultimate consumer would be forced to give up an additional dollar on every $100 he now spends for the clothing, feeding, education and happiness of his family, on top of all the present extra taxes he pays on cigars and ice cream sodas, movie and theater or concert admissions, tooth-paste and shaving soap, continuing also, if he is a stockholder, to pay the tax on distributed earnings.

Chairman Fordney, of the House Ways and Means Committee, favors, instead of this undistributed earnings tax (which he sees "would retard necessary additions to working capital"), a flat tax on corporation earnings. The man up a tree will scratch his head in vain to find out how such a flat tax would increase needed additions to capital.

All these schemes, of course, leave out of account the one-third of our total Federal expenditure of some six billions yearly that might be saved by the cutting in half of naval and military estimates—a reduction which would still leave our war costs heavier than they ought to be for a non-militaristic republic on a peace basis. Our statesmen, in fact, seem to have entirely lost sight of the wholesome axiom that taxation should be limited to the actual requirements of the government economically administered.

This whole discussion, however, will have served one good purpose if it rouses people generally to some live thinking on the subject of taxation.

Is it possible to levy a tax which, while affording sufficient revenue, is at the same time just, dodger-proof, easily collected, sure to encourage rather than discourage enterprise and industry and to help rather than hinder and burden the masses of the people—so contributing to the genuine progress and prosperity of the country as a whole?

Why a Budget?

UNITED STATES is the only nation of first rank in the world which has yet to adopt the budget plan in the formulation of annual estimates of its income and expenditures. Each of the ten departments of the Federal Government makes up its own estimates of its requirements independently, bureau heads submitting special bureau requirements to department heads, the department heads submitting these estimates to the President and he, in turn, submitting the estimates to Congress. Then they go to the committees on appropriations in each house, and after hearings and examinations are reported back for action in the shape of a jumble of separate appropriation bills. There is utter lack of co-ordination in the matter; the whole thing is piecemeal and fragmentary. Neither Congress nor the people at large are permitted such definite and coherent presentation of the facts as is essential to the formation of an intelligent judgment on the wisdom and advisability of proposed expenditures of the people's money.

Much mystery has been made about this whole matter. The commission appointed by President Taft, more than a dozen years ago, to investigate the subject and present a modern budget plan embodied its recommendations and their bases in four huge volumes calculated to puzzle a Philadelphia lawyer. Despite the repeated efforts of Presidents Roosevelt, Taft and Wilson to procure the enactment of a budget law and despite the almost unanimous demand of the commercial organizations and the press, Congress after Congress has "played horse" with the proposition. So gross was the mockery of the whole principle and purpose of a budget in the measure passed by the last Congress in its closing months, and so palpable its sham and pretence of acceding to the people's demand, that President Wilson was obliged to veto the bill.

Let it be understood that the making of a national budget means simply the cutting of one's coat according to one's cloth. There is nothing occult or difficult about it. Both the British and the French systems offer useful models easily adaptable to American conditions. For that matter, there is not a large industrial establishment in the country that could not furnish such a working model. Let the Secretary of the Treasury shoulder the responsibility of "cutting the coat"; of intelligently comparing and rightly relating one item with another, co-ordinating all the items and plainly setting forth the total sum required to meet this total expenditure, with his propositions as to how it should be raised and the increase or decrease of this tax or that tax involved. Let him support and defend his budget on a stated day in open session of the House of Representatives assembled as a committee of the whole on the state of the nation. Let him answer questions which representatives will have had opportunity to prepare by previous study and examination of the budget.

After such a focusing of the fierce light of public discussion on the budget as a whole and on its outstanding features, Congress will be unlikely to indulge in log rolling and in "pork barrel" appropriations.

The Right to Strike

IN THE controversy provoked by the attack of the United Mine Workers of Kansas on the industrial court of that state the issues seem to have been confused by unfortunate appeals to class bias.

The Kansas labor leader declares that the law itself is "an infringement on the sacred rights of every honest working man in the state of Kansas, an insult to every man who believes in the principles of liberty and justice . . . . and the beginning of a movement intended to enslave the working class of America."

There would have been no possibility of enacting the law that created the tribunal now complained of, if the leaders of the miners' union had not forgotten that every right, whether of an individual or a group, carries with it corresponding responsibility. The ancient maxim of the Roman law that "a man must so use his own as not to injure another," applies to the exercise of rights as well as to the use or misuse of property. It applies to employers and to employes equally.

When the Kansas miners struck in 1919, refusing all discussion and negotiation of their ultimatum, tying up the railroads and the factories and exposing little children and sick people in the hospitals to the suffering and possible death from freezing in mid-winter weather, they showed a reckless disregard of the rights of the public. If the mine operators, in refusing the demand of the miners, were guilty of similar disregard of the rights and welfare of the public, out of wanton and selfish regard for their own pockets only, then they also exceeded the limits of their rights. "Freedom of contract" is violated by the use of compulsion on either side.

It may be, as the labor leaders assert, that the Industrial Court in actual practice has discriminated in favor of capital in such matters as the granting of increased rates to public utilities and the refusal of wage increases. The court is an experiment, and if time has developed flaws and faults in its constitution and working, then the law creating it should be amended. The important matter is that a public tribunal free from bias on one side or the other and empowered to hear and determine disputes between employers and employes, substituting reason and justice for force and violence, is a step in the right direction. The justifiableness of any strike is a question that should be left to the arbitration of an impartial tribunal likely to take into account the rights of the public as well as the rights of the workers and of their employers.

The Anomaly of Aristocracy

MUCH wonder and surprise is excited by the spectacle of a scion of royalty in overalls doing a useful job of work. Even in this land of the free in which honest work is no disgrace to any man or woman, much is made in the papers of the fact that, in various capitals of Europe, former princes and princesses, generals and admirals are now earning their bread as porters, peddlers, waiters, waitresses, flower sellers and newspaper venders and even as bootblacks and teachers of languages.

For the most part, we seem to look upon an aristocrat obliged to share the lot of common humanity by earning his bread in the sweat of his own brow, rather than that of other men's brows, as an anomaly—stranger and more incredible than was the circus giraffe to the farmer in the old story.

From an enlightened American point of view, the aristocrat satisfied to live a life without useful work and to fritter away his God-given birthright of brain and brawn in wasteful, frivolous and inane loafing; spending his time and his energies on the fashionable routine of balls, dances, dinners and jazz generally, should be the anomaly—the freak. And the freakishness is increased when the pseudo-aristocrat who so separates himself from share in the common human life, choosing to become a parasite instead of a producer, lays the flattering unction to his soul that, because of inherited title or wealth, he is somehow entitled to regard himself as superior to other people. He labors under the insane delusion that idleness, not industry, is honorable.

Of course, the only real aristocracy is the aristocracy of worth proven in service. If these "nobles" whose hard fate the world is asked to pity, have found out how little do blood and titles count when it comes down to the realities of life, their experience will be worth all it cost them. They may at last develop through useful work into "nature's noblemen."

And perhaps the lesson should not be lost on those foolish Americans the height of whose ambition is to marry off their daughters to European title-holders.

Mr. Ford's Page

THE time for a business man to borrow money, if ever, is when he does not need it. This is a rule whose observance would prevent a great deal of trouble and, what is more, would turn out a better disciplined class of business men.

A business is one entity which must stand on its own feet. There is a great deal of talk about the soullessness of business and about the ruthlessness with which big concerns take their own wherever they are able, but just the same, if business were superintended by sentiment and managed by dreamers, there would be no business.

It is the unconscious compliment which people pay to business, that they always are ready to believe that business can help them, but who ever saw the public run to the aid of a sinking business? Why? Because there is an unconscious belief that the business that cannot stand on its own feet is not worth bothering about. And it is true. That is the whole austerity and severity of business; there is no monastic rule more austere; there is no military discipline more severe; that business is justifiable only as it serves, and that it is permanent only as long as it can stand by right and not by favor.

A business concern is a living body, though not nearly so perfect as the human body. If the business entity were as united and as responsive as the human body, the progress that we are making now would seem nothing in comparison with the progress we should then make. In the human body, the executive functions located in the office up in the head are able to convey their orders directly to the hands, feet, eyes or mouth. Normally, orders are precisely obeyed. But in business it often happens that the executive ideas could not be recognized by the time they have passed half-way down the shop.

Now, because business is like a living body, it is capable of derangement, sickness. We make a great mistake when we think that business becomes sick only from without. The real illness to fear is not "depressed trade" (that is an outer condition), but deranged functions, an internal malady.

Take the tree. In times of "good business," so to speak, it clothes itself luxuriantly with leaves; it pumps streams of sap from the nourishing earth; all its leaf-factories are kept going, in the daytime gathering the necessities of life and growth, in the hours of darkness absorbing them. Then come "bad times," so to speak: autumn storm, winter cold. The tree easily and naturally adjusts itself to the change. It detaches its leaves. It slows down. But it does not "fail." It does not "borrow." It simply trims itself to the situation; it does not even freeze up. When the life processes begin to flow full again, the tree is there ready to receive them. It stands on its own feet. If it did not, it would die. Indeed, the failure to do that is all that constitutes dying.

Now, the internal ailments of business are the ones that require most attention. "Business" in the sense of trading with the people is largely a matter of filling a want of the people. If you make what they need, and sell it at such a price as will make possession a help and not a hardship, then you will do business as long as there is business to do. People buy what helps them just as naturally as they drink water.

But your process of making the article will require your constant care. Machinery wears out and needs to be restored. Men grow uppish or lazy or careless, and that is a situation that must be remedied too. A business is men and machines united in the production of a commodity, and both the men and the machines need repairs and replacements. It is a fact which every business man should realize that sometimes it is the men "higher up" who need this treatment most and get it least.

When a business becomes congested with bad methods; when a business becomes ill through lack of attention to one or more of its functions; when executives sit comfortably back in their chairs as if the plans they have inaugurated are going to keep them going forever; when business becomes a mere plantation on which to live, and not a big work which one has to do—then look out for trouble.

You will wake up some fine morning and find yourself doing more business than you have ever done before—and getting less out of it. Keep on, and you will begin to feel the pinch. It is then that you show what is in you; it is the last examination to determine whether you are entitled to the degree of Business Man.

In such a situation you can borrow money. And you can do it, oh, so easily. People will crowd it on you. It is the most subtle temptation the young business man has.

Or in such a situation you can take off your coat, plunge into the business and see what ails its internal workings. Go through it like a surgeon. Remove dangerous growths, cut off wastes, purge away accumulated customs which hinder, put your business on the operating table and give it a chance for its life.

If you borrow money, you are simply borrowing stimulus to whatever it may be that is wrong. You are feeding the disease. Is a man more wise with borrowed money than he is with his own? Not as a usual thing. To borrow under such conditions is to mortgage a declining property.

The time for a business man to borrow money, if ever, is when he does not need it. That is, when he does not need it as a substitute for some things he ought himself to do. If a man's business is in excellent condition and in need of expansion which the business can take care of, that is another matter. But if a business is in need of money through mismanagement or a disorder of the internal functions, then the thing to do is to get after the business and correct the trouble from the inside, not poultice it by loans from the outside.

Money is only another tool in business, anyway. It is just a part of the machinery. You might as well borrow 100,000 lathes as $100,000, if the trouble is inside your business. More lathes won't cure it; neither will more money. Only heavier doses of brains and thought and wise courage can do it. A business that misuses what it has, will continue to misuse what it can get; the point is, cure the misuse. Then, when that is done, the business will begin to make its own money, as a repaired human body begins to make sufficient pure blood.

Borrowing may easily become an excuse for boring into the cause of the trouble.

Borrowing may easily become a sop for laziness and pride. Some business men are too lazy to get into overalls and go down to see what is the matter. Or they are too proud to permit the thought that anything they have originated could go wrong. But the laws of business are like the laws of gravity, and the man who opposes them feels their power.

Borrowing for expansion is one thing; borrowing to make up for waste and mismanagement is quite another. You don't want money for the latter, for the primary reason that money cannot do the job. Waste is corrected by economy; mismanagement is corrected by brains and application; and neither of these correctives can be confused with money. Indeed, money under certain circumstances is the worst enemy of these desirable qualities. And many a business man thanks his stars for the pinch which showed him that his best capital was in his own brains and not in bank loans.

Borrowing under certain circumstances is just like the drunkard taking another drink to cure the effect of the last one. It doesn't do what it is expected to do. It simply increases the difficulty. It is the capstone of the young business man's education when he sees that the tightening up of the loose places in his business is much more profitable than any amount of capital at 7 per cent.

THE time for a business man to borrow money, if ever, is when he does not need it. If he really needs it, it is usually a sign that he needs something else first. The use of money in business is extremely limited. It cannot be the substitute of repairs and replacements. If a granary is losing out through rats, the cure is not to put in more grain but to stop the rat-holes. The business man's best loan is made of himself—his brains, interest, application. A business cannot be cured by money-poultices from the bank, but by surgical operations within. Loss is corrected by building up the processes of gain—not by borrowing. The cure of every business's difficulty is within itself. Internal difficulties must be met by internal corrections, not by external borrowings.

"Cutting Up Old Circus Money"

III. H-e-y R-u-b-e!—By HARRY BARNET

John Robinson the Third.

WHEN the cry of "Hey Rube" goes shrilling and darting like a crazy thing among the tents and wagons of a circus it means the commencement of a free-for-all fight between the town people and the showmen.

The cry is the name for a battle, and it also is raised by the show people. Then everybody with the outfit grabs a tent stake, or whatever sort of a fighting tool there is at hand, keeps up the cry of "h-e-y r-u-b-e," and begins to crack every head in sight that doesn't belong to the aggregation.

Few outsiders, however, can visualize a "hey rube." Although there have been many classic fights beneath the White Tops, not many first-hand accounts of them have appeared in print, because their record is buried in the unwritten history of the circus.

"Fights between the town people and the circus folks start mighty easy," said "Governor" John F. Robinson one day, when he was rumaging into his recollection, and bringing out material for this series of interviews with him on the traditions of the circus that heretofore have been handed down only by word of mouth from circus generation to circus generation.

"I make that statement out of the experience of the seventy years that I spent under circus canvas as a performer and an owner," he continued. "My father started a circus about a hundred years ago, and I was born late in 1843. From the time I was eighteen months old I was a performer with the show, until pa retired from the business. Then I took over the ownership of the show, and owned it for fifty years, when I passed it on to my son.

"During that time I've been through some of the biggest battles in circus history. Our show got the reputation of being the toughest show in America for rowdies to tackle, and I guess we earned that reputation. We never hunted trouble, that is certain, and we did everything we could do to keep out of it, but when it came our way it was seldom that we got the worst of it.

"In old days there was a bully, sometimes three or four of them, in every village," the "Governor" went on, and warmed to his subject, "and they had an idea that if they could lick a showman, no matter how puny or sickly or small he was, their reputations as bad men would be established forever. The rowdies never were satisfied until they got into a fight with us, and it always ended by them getting the worst of it.

"In localities where there were three or four bullies, they banded together to make a raid on the show. It got to be quite an event for us to go through a village or a town without a rumpus of some kind, so we had to carry several good fighters with the show to accommodate these fellows.

"When pa retired, and I took over the show, I made it a rule that as soon as we got into a town, and the rowdy showed up, we were to get him licked as quick as we could, and have the job done with. That was the best thing for all of us, because the question as to who was the best man was settled. Then we could go on and put up our tents, and give the performance with a little peace.

"If that wasn't done, the fellow would keep on annoying us, and it had to come sometime during the day. Sometimes two or three drunken men would spoil the whole day's business for us by intimidating people. They would be afraid to come to the circus, because Jim So-and-So, who was the bad man of the community, was in town with his friends, all of them drunk, and feeling mighty mean, and they were going to clean out not only the show, but the whole town.

"Later on, I hit on a very good plan that saved us a lot of fighting. As soon as we showed up in the town, and the bad man came around, I hired him as special policeman for the show. I offered him any salary he asked, because he seldom collected it. I furnished him with a badge and a club, and got him to go along with the show if I could. In his own town he was all right, and got along very well, but the next day he would run into the bully of the neighboring town, and nine times out of ten he would turn out to be the rankest coward you ever saw.

"Usually, he would tear off his badge, throw down his club, and run for the woods without waiting to be paid; he wanted to get away from there without any stops. I was always glad when the other fellow chased him. Then I hired the new man to take his place. In a day or two he would meet the bad man of the next county, and show the white feather. I kept that up for a whole season, and it worked the best of anything we tried out. But I never considered these men a part of our organization; I just hired them to get rid of their nonsense.

"And a lot of these fellows who started fights in the old days weren't particularly hunting a fight with a showman. They seemed to get kind of crazy with the excitement of having a circus in town, and they would fight an elephant just as quick. Sometimes these fellows would follow the show for a week, trying to get a fight out of us. They'd travel on horseback right with us, and show up on the 'lot' about the same time that we did.

"Down in Tennessee, the grandson of one of the Presidents of the United States followed the show for several days, and he got pretty friendly with me. We then were traveling by wagon, and the jumps were short. And I kind of liked this President's grandson, though he was drinking pretty hard.

"One evening when the performance was about ready to start, he came to me and very confidentially said that he'd been following the show for several days trying to get the animal men to let him get in the cage with the white bear so he could fight it, but the animal men never would let him do it. He appealed to me, because he said he didn't think he could ever rest until he had tried it.

"Of course, I knew what fighting the white bear meant. This fellow would have a knife, and a pistol, and probably a whole lot of his friends to help him, and white bears cost a lot of money in those days. It took me the whole evening to get the idea out of his head, and then he was reluctant to leave the show.

"Right after the Civil War, and up to 1870, it was something awful to take a show into the South. There hadn't been a legitimate circus there for years, and the people were circus crazy. Pa had been traveling South with the circus all his life; and we had a world of friends and relatives there, but that was no protection.

"People in the South then were very clannish. The minute a stranger got into a community, no matter if he came from the next county, if he wasn't known and couldn't be vouched for, it was taken for granted that he was a carpet-bagger, or someone with designs on the community, and, of course, he wasn't to be tolerated. The quicker he could be licked the better.

"We were the largest circus in that country, and we drew immense crowds. Show day was a holiday, and the men drank freely to celebrate. That made them lose their heads, and, as the most of them had been under fire for three or four years, some of them didn't know the war was over; they thought they had to keep on shooting. In that way there were a good many circus rows started that never otherwise would have occurred.

"To try to tone things down, for several years I carried forty or fifty muskets with the show. Every day we unpacked them, and stacked them right by the front door. They stayed there until we tore down at night, unless there was a commotion of some sort, or anything that looked like there was going to be trouble. Then the boss canvasman blew his whistle, and all the working men came running, picked up a musket apiece, fell into rank and file like a company of soldiers, and waited for orders.

"Then we had a pistol holster scheme. We bought two hundred pistols, and had a holster made for every man with the show. He wore two of them strapped to his waist while he worked. The holsters were numbered, beginning with 200 and better, and a man would be driving stakes with a big pistol in a holster on each hip, one maybe numbered 280 and the other 460, so it looked as though we had a thousand of them instead of only two hundred. With the muskets they made a pretty good showing, and I think that scheme is the only thing that took us safely through that country.

Ticket wagon of the wagon show of 1870.

"And the same thing held true in the North. The old soldiers, especially in Ohio, Indiana and Illinois, wanted their fun on show day, and where there were a lot of them in a community they were pretty bad, and gave us plenty to do. So I adopted an additional scheme with them. We gave them a drink or two, and jollied them along, and after a while they would sit down and commence to tell their troubles to one another. Eventually, they went to sleep.

"We all carried scissors, and somebody would slip up and cut off their coat tails, which made short jackets of their coats. Then a big round hole was cut in the seats of their trousers and their underwear, and their shirt tails were cut off. When they woke up and saw their plight, instead of hunting trouble, or going uptown and getting another drink, they would make a bee-line for home, or out into the country where they could get some more clothes. And we had several ways of trimming their clothes. Sometimes their trousers were ripped from the leg bottoms to waistline, and their underwear the same way. When they got up they had practically nothing on, except their shirts and collars. It always was a mystery to them how that was done, but it saved us a lot of fighting.

"The first 'hey rube' I remember," the "Governor" said after a pause, "was when I was a mighty little boy in Port Royal, Virginia. Some of the toughs of the town started a row with us, and they got the worst of it. Next morning the whole show was arrested, men, women and children, and when the authorities came to arrest us they told pa that they would release everybody with the show if he would give up the man who did the fighting.

"They said that their witnesses told them that the man who did the most of the harm to the town rowdies was a Mr. Hey Rube; that every once in a while during the row a circus man would call his name, and down would go another town fellow. So they concluded that Mr. Rube was the man they wanted. And they even had a description of him. He was over six feet in height, and his coloring was dark. While the fight was going on he carried a club over seven feet long."

The "Governor" chuckled.

"'Hey rube,' you know, is just the rallying cry of the circus people whenever trouble starts," he added.

"It was no uncommon thing for us to have to pull the wagons around in a circle, and hide behind them and shoot through the spokes in the wheels, like the pioneers did when the Indians made raids on them," he went on.

"The last time I remember of doing that was in Lebanon, Tennessee, while we still were traveling by wagons. During the afternoon, a rowdy came on the lot, and made himself offensive to the women—he went around to the back of the canvas, and slit the side wall of the women's dressing room with a sharp knife. Then he walked through, and in among them while they were putting on their tights.

"Of course, they screamed, and covered themselves as well as they could. One of my performers heard the commotion, and he came running from the men's dressing room—it was just before the matinee—and saw this fellow there. My man hit the town fellow, and knocked him down. Then he picked him up, and threw him over the side wall.

"Well, the rowdy also got a pretty good beating after he landed on the outside, and it took him the most of the afternoon to get over it. When he got away from where he had been thrown, he went to his friends, and told a story about having been beaten up by showmen while he was innocently looking around. Then they formed a gang, and wanted to clean out the show.

"We pulled the cages and the wagons around to make a barricade, and got all of the show people in the center of it, and also the horses. Then we got shovels and dug the center out of the ring and piled the dirt on the edges to make a breastwork, because it looked as though we were in for a hard fight. Then we laid behind that breastwork, waiting for whatever was going to happen.

"The rowdies circled around us for a while, shooting occasionally, but we laid quiet. After a while they went up town, and rang the courthouse bell. Of course, the decent people of the town came running out of their homes, and wanted to know what was the matter. The rowdies said they were going down to clean out the show, and they did drum up quite a crowd to follow them back to the lot. But we presented a couple of volleys, and too strong a front to them, and they again went back.

"The upshot of the whole matter was that we stayed there until daylight. There was a lot of shooting, but none of us was hurt. About five o'clock, when the crowd went up town to get some more drinks, we threw the tents and the properties on the wagons without paying much attention how they were loaded, hitched up, and quietly made our way to the next stand. For a wonder, we weren't followed.

"But the saddest circus rumpus I ever saw occurred over in a little town in Virginia. The day we showed there the rough element was more or less drunk, and like fellows in that condition, they were hunting trouble from the minute the show pulled on the 'lot.' And among these rowdies was the son of one of the most prominent citizens in the town.

(*Concluded on page 12*)

"World Disarmament First!"—The Slogan

Economic Situation Demands Leading Place in Government Program for Relief From Crushing Tax Burdens Imposed by Militarism

PRESIDENT HARDING is beset at the outset of his administration by a multitude of problems, foreign and domestic, and one more perplexing than the other. The situation he faces is one demanding clear vision and sane judgment. America counts in this critical hour on the new President's level-headed common sense. He is the sort of man likely to be guided by the elemental and dependable wisdom summed up in the saying: "First things first." Nothing could be plainer today than that our foreign and our domestic problems are closely related and interdependent. If we are to go forward steadily and surely to any adequate meeting of the situation, we must take up these problems one at a time *in their right order.* Every sensible man knows that when, in any sphere of life, a number of tasks clamor at once for his attention, all the rest fall obediently into their proper places just as soon as he tackles the first thing and tackles it first. This is the sure way to dispel all confusion and perplexity; the only way to make satisfactory progress all along the line.

Probably actuated by some such sure instinct, the President has called a special session of Congress to meet early in April for the consideration of *tariff and revenue measures.* Such consideration is required not merely to afford temporary relief to present business conditions, but permanently to avert threatened disaster and clear the way for a return of that progressive and permanent prosperity on which the real strength of the nation must always depend, in peace or in war.

At Bottom a Taxation Problem

WE CAN be sure that the President and his advisers put no narrow construction on the phrasing of the one definite purpose for which Congress is convened in extraordinary session. It is recognized that TAXATION is the one big problem that must be tackled without delay in any endeavor to bring about "normalcy."

The whole problem of taxation at this time resolves itself into a radical reduction of taxes.

And the one way to reduce taxes is to reduce armaments. DISARMAMENT FIRST!

We are faced with a national debt on which the interest charge alone amounts to one billion dollars yearly—a sum equal to the entire cost of the machinery of government a few years ago.

The only way to reduce our debt is to disarm. DISARMAMENT FIRST!

Factories are closed down wholly or in part all over the country because abnormal and fluctuating exchange rates cripple the buying power of our European customers and cut off our export trade.

There is no way to the establishment of stability in foreign exchange and a revival of our export trade that does not begin with disarmament. DISARMAMENT FIRST!

To solve the problem of high living costs, we must increase production, improve transportation, get rid of heavy interest burdens and of those productions hampering and harrying governmental restrictions generally that are part of our unsound, helter-skelter and destructive war taxation.

None of these devoutly to be wished consummations is possible of accomplishment without disarmament. DISARMAMENT FIRST!

The considerable and lasting revival of business and industry that is absolutely necessary if our people are to be able to make a living and develop individual and national resources, with a square deal to labor and to capital equally, will be possible when our finances are restored to a sound basis by the deflation of a ruinously swollen volume of paper currency and a coincident deflation of credits that favor Wall Street speculation and stock jobbing at the expense of the legitimate constructive and productive industries of the land.

Such financial unsoundness is a by-product of burdensome taxation necessitated by heavy expenditures for armament. DISARMAMENT FIRST!

The complicated and snarling diplomatic problems that face the new administration are truly hydra-headed and formidable. Any one of them offers snares and pitfalls enough to daunt the boldest. Together they present a menace of cumulative and continuing disaster, if not handled wisely. Here are just a few of these problems: The Japanese situation growing out of California land laws, our demands that Japan return Shantung to China, cease the occupation of Russian Saghalien and our demand for the internationalization of the Island of Yap; the Mexican situation and its complication with the claims of foreign oil exploiters; our protest against the action of Britain and France in restricting the development of natural resources in mandated territory to their own nationals; the Cuban situation, possibly involving armed intervention; the Chinese situation as it bears on the consortium and on the open door policy; the Turkish-Armenian dispute; Russian trade and the problem of recognizing the Soviet so-called republic; the Irish situation; the disputes with Costa Rica, Salvador and Honduras involved in the Nicaraguan treaty; the Colombia treaty dispute; the question of American interest in fixing and collecting indemnities from Germany; the League of Nations; the International Jew.

Many and clamorous as are these problems in our foreign relations, they cannot take precedence over our domestic conditions and needs in the minds of Executive or Congress. We shall best fit ourselves to deal adequately with questions of foreign policy by first setting our own house in order. Besides, in the long run, it will be found that the measures adopted effectively to banish discontent, depression and disorder at home will prove to have a wholesome reaction in the attitude of the rest of the world toward us. Every one of the foreign problems above itemized will be resolved in the last analysis into the one problem of setting an example to the nations that must result in the diminishing at least of occasions for international jealousy, envy and strife. DISARMAMENT FIRST!

Disarming Must Be Gradual

LET it be understood from the start that, in all sane and practical discussion of the subject, "disarmament" does not mean an immediate and complete disarmament. It is not to be reached at a single bound. All the more reason to get started on the journey without avoidable delay. What business men, legislators and economists have in view when they use the term disarmament is a gradual and partial disarmament to start with; more specifically, a restriction of armaments beginning with an immediate reduction in naval building programs. Coincidently with this naval reduction, of course, must go a gradual cutting down of military strength. Such reduction of the strength of the armies is already under way, having been compelled by the veritable impossibility of keeping an army on a war footing in time of peace. The whole question of present urgency condenses itself, then, into the simple restriction or cessation of naval building programs running anywhere from three to seven years ahead and—growing by what they feed on—involving unending renewal in ever increasing measure. For such restriction of naval armament, it is agreed by competent authorities, whose conclusions we may accept for all present purposes, we must have an international agreement, an agreement arrived at by assembling and reasoning together.

The matter is further simplified by agreement that the success of such a conference would be best assured by limiting to the five Great Powers that fought together on the side of the Allies in the World War and which may be presumed to be most vitally interested in speedily reaching such an agreement. Senator Borah's resolution for a six-month's naval holiday, or suspension of naval building (of which this series of articles will have more to say hereafter) goes even further and would limit the conference and agreement to Great Britain, Japan and the United States. This to begin with, provision being made for the later adherence of other nations less immediately concerned. This point is to be kept well in mind. It means that the United States would feel perfectly warranted in ceasing the fire of piling up the back-breaking burden of taxation for *increase* in the nation's naval armament if only these two of its competitors in naval expansion would do likewise.

The United States is today flinging the people's money into the building of warships on a scale far beyond the expenditure of either Great Britain or Japan. The United States is spending money on naval armament on a scale unprecedented in the history of this country or of any other country.

Congress has been at great pains to obtain very full and complete data bearing on the subject. The mass of testimony elicited in the hearings before the military and the naval committees in both House and Senate during the past three months would fill a dozen large volumes of 1,000 pages each. Boiling down the voluminous official reports, it will be the endeavor of THE DEARBORN INDEPENDENT to give its readers the gist of the whole matter in a way to make it easily grasped and clearly understood, always having due regard for faithfulness to the text.

Some Figures That Shout

FIGURES are usually deadly dull reading; but the figures in this matter have so vital a relation to the future of America and of mankind and they speak so eloquently of the instant need of concentrating on the great issue of Disarmament or Universal Bankruptcy and Disaster that they must make irresistible claim on the reader's attention.

Take the one fact that out of total appropriations for the fiscal year 1921 amounting to $4,175,820,088 less than $3,694,075,362 or 88.4 per cent of the whole, went to defray expenses incident to past or anticipated future wars. Eight times as much of the nation's income devoted to the "burglary insurance" of war expenditures as to payment of all the remaining departments of the government; the executive and administrative departments, the entire civil service, legislative and judiciary departments, public buildings and public roads, river and harbor improvements, and all the immensely valuable research and experimental work of the various bureaus of the Department of Agriculture and the Federal educational and welfare activities. Even more glaring is the disproportion between our Federal expenditures on militaristic machinery and agencies provided for in the estimates for the fiscal year beginning July 1, 1922. These call for total expenditures of approximately six billion dollars, of which one and one-half billions is allocated to military and naval purposes. That is to say, out of every $100 of Federal expenditure $93 is dropped into the bottomless pit of war expenditure! The following table, prepared by Herbert D. Brown, chief of the United States Bureau of Efficiency, presents these facts graphically and is worth studying:

Analysis of Appropriations for the Fiscal Year 1921.

Purpose	Amount	Total	Per-centage
1.—Care and maintenance of veterans of war of 1914, including compensation, rehabilitation, hospital treatment, etc.	293,168,400		
2.—Pensions on account of military service prior to war of 1914.	279,150,000		
3.—Interest on the public debt	980,000,000		
4.—Contributions to sinking fund for amortization of public debt	260,800,000		
5.—Expenses incident to Federal control of interstate transportation	1,025,000,000		
I. Total appropriations incident to past wars		2,838,118,400	67.9
6.—Military Establishment	418,232,382		
7.—Naval Establishment	437,724,580		
II. Total appropriation for present national defense		855,956,962	20.5
III. Total appropriations for war purposes past and future		3,694,075,362	88.4
IV. Total appropriations for general purposes, except the Postal Service*		481,744,726	11.6
		4,175,820,088	100.0

*NOTE—The total appropriations for the postal service in 1921 were $504,399,000. These are not included in the above totals because the estimates cover the full cost of the postal service, although this cost is defrayed almost entirely out of the postal revenues.

President Harding's Promise

IN THE course of the congressional committee hearings practically every man and every woman whose standing and record were likely to give weight to their views or their information expressed themselves freely on the whole subject of disarmament. These witnesses included General John J. Pershing, General Tasker H. Bliss, former Ambassador Henry White, Josephus Daniels, then Secretary of the Navy, and several high naval officers and army officers, Norman H. Davis, acting Secretary of State and leaders of long experience in both houses of Congress and on each side of the House. It is impossible not to be struck with the unanimity of the opinion expressed. There was practical agreement not only on the desirability of disarmament but on the immediate and impelling necessity, imposed by the economic situation, of the earliest possible convening at Washington of an international conference if national and international bankruptcy is to be averted. What difference of opinion developed had regard rather to the nations to be represented and the limitations of its functions especially in the matter of a naval holiday binding only on Great Britain, Japan and the United States, or an inclusion of all five of the Great Powers on a program of general and permanent disarmament.

President Harding himself is on record in favor of disarmament in his inaugural speech. In an earlier statement to a correspondent of the New York *American,* he said: "I will do everything that is becoming to bring about the co-operation of the United States in any scheme for world disarmament." Another correspondent quotes him as saying a short time ago that he is heartily in favor of an international conference

Jewish Leaders Scheme For Gentile Support

The Masons, the K. of C., the A. P. A., Deceived.

Protocol Plot "to Split the Gentiles" Accurately Followed

THE Jews of the United States are now organizing into one big union, to be known as the American Jewish Congress, completion of which is to be made before October 31 of this year, for the purpose of tying every individual Jew and every Jewish organization to a definite plan of action.

What this plan will be can only be surmised by past and present activities. Whether a new set of leaders will appear, is doubtful—even if a new set of office-holders should be appointed. It is said that the officers are to be chosen by popular vote among the 3,000,000 "or more" Jews in the United States, and it is sincerely to be hoped, for the sake of Judah and the welfare of the land, that the Jews will vote for frankness in their leadership and not for the folly which has marked it so pathetically the last year.

A very careful reading of all the utterances of Jewish rabbis, editors and leaders during the past year yields—in addition to the always undisguised antagonism to the rest of the people which marks Jewish utterances in America for many years back—nothing but a booming rhetoric about "retaliation," "fighting like men," "defending our sacred rights," "bringing Haman's woe upon our enemies" (Haman was hanged), and the like.

The Jewish position at this moment, at least the position assumed by the leaders, is that the rest of the world is wrong and Judah alone is right. Their position assumes that the rest of the world is maddened by a strange and poisonous obsession, a kind of psychic disease called "anti-Semitism," and only Judah is sound-minded and can see things readily and see them whole. The rest of Israel (to put it that way), is utterly in error; the tribe of Judah alone has the true view of the case.

Prussia thought that way. Prussia is the only modern analogy for Judah. The kaiser caught the "chosen people" idea (it is very clear where he got it), and the two ideas clashed in Germany. The Prussian tried his faith in battle (pushing the other tribes forward to fight for him) and was defeated; Judah is trying to do the same thing, letting non-Jews do the battling, and in so far as Judah is wrong in his interpretation of his Scriptures and his destiny, Judah also will fail.

Old Game Played Out

THE principal characteristic of the so-called "Jewish Defense" during the past year has been the attempt to get non-Jews to make the defense. The word "defense" is itself a piece of strategy, since no "attack" has been made. There is, it may be stated, plenty of material for an attack such as would probably constitute Judah's day of judgment, but counsel has been preferred, counsel upon a set of facts which Judah knows better than the rest of the world can ever know them, though they be stated and proved a thousand times.

After all, it is not of such consequence that the non-Jewish world be moved, as that Judah be moved. And today Judah is moved. The Jews of the United States know the facts, and they know that what has been printed in this series is true. What they fear is that the non-Jews will be moved against them. That has been the folly of the past, that the other tribes of men have been moved against Judah, instead of Judah being moved into a position of concord with the other tribes of men. If Judah is wise, she will know her day. This much she already knows: that the studies in the Jewish Question which have proceeded under these auspices in the United States are not "anti-Semitic," are not "pogroms," are not "attacks on Jewish rights," are not any of the things which for public consumption the Jewish leaders say they are; Judah knows that it is a sign of the times that *a certain plan is played out.*

Jewish leaders in the United States are now convinced that their program for this country is stopped. Too much is known about it. For mere "anti-Semitism," the coarse unreasoning and jealous antipathy toward the Jew, the Jew has nothing but contempt. He can endure that. He has weathered it for 20 centuries. But the Jewish leaders know that *this* is something else, very different in its origin, its procedure and its consequences, and that the old defenses and appeals will not do. The appeal is now to Truth. Not to the passion of anti-Semites, nor to the sympathy of non-Jews, but to Truth!

The chief achievement of the present series of studies is to apprise the Jewish leaders in such a fashion as they can no longer doubt, that *a certain plan is played out.* It is *done.* The task before Judah is readjustment, not defense. And no exposure of Judah's consciousness of this has been more pitiless than his own methods pursued the past year.

With all the talk of "fighting like men," Judah has not done so and, what is more, will not do so. There is something to meet, to be sure, but it cannot be fought against; it must be met and acknowledged.

The Jewish defense up to this time has been an attempt to get other people to do their fighting—it is the Prussian tribe enlisting Saxons, all over again.

It is significant also that this has been done by misrepresentation of the grossest character.

As a matter of plain business judgment it ought to appeal to the Jewish leaders as superlatively stupid to obtain support by this method, because the reaction when the deception is discovered is bound to be severe.

Masons Not Deceived

TAKE the method by which Masonic sympathy was for a time enlisted against a plain study of the Jewish Question. True, it was never enlisted to the extent of gaining official Masonic action, although there is a large infiltration of Jews in American Masonic lodges; but there was a certain amount of success obtained among a few unofficial Masonic editors who lent their publications to the dissemination of the Jewish falsehood that the studies in the Jewish Question had included the charge that Freemasonry was allied with Judaism for the subjugation of the world.

The Jews did not scruple to circulate that story among Masonic lodges. In certain lodges in dependencies of the United States, they went so far as to circulate printed matter urging a commercial boycott.

But the Jewish dealers in this falsehood evidently did not foresee that Masons, thus brought face to face with the statement that a paper like THE DEARBORN INDEPENDENT was linking them with the Jewish program for world power, would examine copies of the publication to read those strange statements for themselves. And when the Masons read, they read again, for they could not find the things which the Jews had said were there. And they never did find them.

In the meantime, however, many Masons discovered that there was a Jewish Question within the limits of Freemasonry itself. This Question assumed almost the same form in diverse places, and the end of the matter was that this piece of false Jewish propaganda proved a boomerang.

There is a great deal that could be said on this point, but it is not at issue just now. The matter is alluded to in order to illustrate the Jewish strategy of endeavoring to get someone else to go out to fight. And they did get a few Masonic editors to fight—on a false premise. They even made some Freemasons believe for a time that this series of articles was specifically anti-Masonic.

How far the Jews may control American Masonry is a matter for Freemasons alone. In how many cases Jews are at once prominent in American and French Masonry is another point that is for Freemasons alone. What concerns this public chronicle is the fact that twice before in the history of American Masonry the Jews hid behind the Masonic name to the temporary detriment of that name in public esteem, but this third time they not only endeavored to hide behind it, but to push the Masonic Order out in front to do their fighting for them. Freemasons will always be found ready to defend freedom of faith and speech, but it is doubtful if any pretext or falsity will be sufficient to lead them to activity of such a nature as the Jewish leaders evidently expected of them in the recent past.

Will K. of C. Be Fooled?

WORD just comes in the daily press that the Knights of Columbus have declared a campaign against anti-Semitism in the South and that a large number of lecturers are being sent out to combat it. Coupled with this announcement is another that the Knights are also to combat religious prejudice, which is apparently connected in some way with what is called anti-Semitism.

These two objects cannot be gainsaid. Anti-Semitism, the hatred of a Jew because he is a Jew, is a most unreasonable thing. Religious prejudice is a deformity which has no place in American life. They are both to be combated. In combating both, you combat the Jewish program, whether you know it or not, for the Jewish program does its utmost everywhere to create anti-Semitism as a mask, and religious prejudice is the strongest motive behind most of Jewish activity as shown by the Jewish records recently reproduced in these pages.

The question is, Have the Knights of Columbus been undergoing the same experience which lately befell Freemasons? Have they been told that the study of the Jewish Question is a form of religious intolerance? Apparently so, in view of the statement that religious prejudice is to be attacked in so far as it is aimed against the Jews, because it is believed that if the taste for religious prejudice becomes widespread the Catholic will be the next to suffer.

If religious prejudice becomes widespread, every man of every faith will be next to suffer, for it is never one-sided in its effects.

Who told the Knights of Columbus that these studies were based on religious prejudice? The only time the note of religion has been struck in these studies was when it was unavoidably struck in publishing the list of Jewish activities as found in official Jewish records, for those records are an almost unbroken list of the attempts of the Jewish powers to do away with every "Christological manifestation" which they could reach with their present lines of influence—even to the taking of the Cross off the uniform of the chaplains of the war veterans. The sacred symbol which means so much to the Knights is "anti-Semitic," in Jewish parlance.

It is stated now and here that the only potent form of religious prejudice operative in the United States today is manifested by the Jewish powers. Other religious prejudice exists, to be sure, and makes itself known, but expends itself mostly in wild words. The Jewish form of this dread growth manifests itself in acts that tell.

This constitutes the regret with which is seen the coalition which apparently exists in some cities between men who are honestly entitled to complain against religious prejudice and the Jews who since their residence in the United States have never known the weight of a single straw of this un-American thing.

This coalition is seen in practically every state in the country in a bargain which apparently runs like this: "If you help us Jews suppress THE DEARBORN INDEPENDENT, then we Jews will help you suppress the *Menace,*" or whatever paper it may be that offends.

When the Dupes Awake

THE suggestion is a most vile one and can only be made where there is an absolute lack of knowledge as to the contents of this series of articles. Yet the suggestion is made and it is acted upon, until in several cities of the United States today we see stalwart Irish chiefs of police acting under the orders of Jewish political bosses.

There is no surprise that the Jews act in this manner. It only serves to prove most vividly some of the statements made in this series. But to see other men made the dupes of the Jews, allured under false pretenses to attempt to pull the Jewish chestnuts out of the fire, is not a good sight.

Again, what will be the reaction when these men, now brought by false pretense into the service of the Jews, learn that there is no religious prejudice at all in the publication they are seeking unconstitutionally to suppress, but merely a quiet and serious attempt to make known a condition which exists broadcast and easily discernible in American life?

But that is not the end of the Jewish duplicity. After whispering to the Knights of Columbus that the Catholic faith in America is endangered by reason of these studies, the Jews then go around to the rabid publishers of anti-Catholic papers and say: "Don't you see what it is that these DEARBORN INDEPENDENT articles are doing? Why, they are reviving the papal hatred of the Jew. Rome is again in arms against the Jew, and THE DEARBORN INDEPENDENT is Rome's instrument!"

And then these Jewish *provocateurs* quote long lines of the history of the Middle Ages. They show in *recently published editorials in Jewish papers the statement that Rome is the eternal enemy of the Jew,* the one enemy of which Jewry must at all times beware. They work on the imagination and the passions of the anti-Catholic bigot, and it is soon whispered throughout the country that the real author of these articles is a Jesuit bent on stirring up another pogrom.

The result is that in anti-Catholic papers we have long, impassioned articles calling upon loyal Americans to suppress this new activity of the Pope!

Verily, the phrase "boob Gentile" is not without

its justification. Here are shrewd Jewish propagandists telling one tale to the Masons, another to the Knights, another to the remnants of the A. P. A., and then they stand back waiting to see the result.

The result, and one would think it a result the Jews would rather evade, is that in no short time, these various groups will turn round and look at the Jew in the background, and will understand what the Protocols mean when they speak about dividing the Gentiles among themselves while Judah takes the spoils.

To cap the climax, as told in our last article and as there is still much more to tell, the very Negroes are propagandized, and the Jewish tale to the Negro is that these articles are really the authorized communications of the Imperial Wizard of the Ku-Klux Klan, and that the remedy is the violent assertion of Negro rights before it is too late.

Anti-Masonic, anti-Catholic, anti-Protestant, anti-Negro—all these the "defenses" of Jewish propagandists against the study of the growing influence of Jewish power in the United States!

It is about time to revise our notions of Jewish cleverness. The course the Jewish leaders are pursuing is the acme of stupidity, and all that is needed to prove that is—Time. And there is so much time that even impatience with the Jewish course is not indulged in. It is a course that condemns itself.

Now, this is the Jewish "answer"—to ask the Masons to believe that a study of the Jewish Question is anti-Masonic; to ask the Catholics to think that a study of the Jewish Question is anti-Catholic; to ask the more rabid Protestants to think that a study of the Jewish Question is anti-Protestant; and to make the Negroes think that a study of the Jewish Question is anti-Negro. There are still the Indians.

Moreover, there are still the Christian Scientists and the Quakers. If a study of the Jewish Question is the signal for a flood of religious prejudice, surely the Christian Scientists ought somehow to be made aware of it.

And right there is a point. Consider Christian Science, a mode of belief and life which has had its share of opposition in very recent years. Parallels exist between Christian Science and the Jews, yet no one ever dreamed of a Christian Science Question existing.

Christian Scientists have considerable wealth, they believe in a comfortable portion of wealth and good things for everyone, they believe these are mankind's birthright. Yet no one ever heard of their being accused of using their wealth to promote the undesirable influences in social life. They never produced an "Aphrodite."

Christian Scientists exert a considerable control over the press. It is no longer the custom for thoughtless editors to write slanderously or inaccurately about Christian Science, for if one were to do so, a Christian Scientist would call the next day and insist on showing him where his error lay. There would be no coercion but that of truth. The newspaper's newsboys would not be assaulted on the streets; the legislators would not be bombarded to make a law against free speech with regard to Christian Science; Christian Science advertisers would not besiege the office with loud threats of boycott; a Christian Science anti-defamation society would not do spy work to find out where the publisher owed a debt and then bring pressure to bear to squeeze him on it; the Post Office Department would not be buried beneath the appeals of Christian Scientists to bar that paper from the mails. No, in friendly belief that if the editor knew the truth he would not do violence to it again, he would be visited and the matter laid before him.

Christian Scientists have many men in high public office—very many. You find them everywhere, and they do not attempt to conceal themselves either. They don't change their names, nor do they attempt to evade questions about their faith; rather, at the first opportunity they will quietly testify to you that they are Christian Scientists and will tell you what Science means to them. Nobody raises a hue and cry about the number of Christian Scientists in public office, because they are not in office for the service of Scientists alone, but for the whole community.

Subterfuge and Evasion

CHRISTIAN SCIENCE has its own press, a very powerful press, and its power consists fundamentally in its attempt at a single-eyed allegiance to the truth of things. No one ever saw that press assailing the Old Testament as being Pro-Semitic, as certain Jewish editors have assailed the New Testament as being anti-Semitic.

But suppose some publication, led by a motive not now to be imagined, should come out in a description of Christian Science as an undermining power, dangerous to the state, destructive of morals, violently revolutionary in character, anti-social in its basic teachings, and should present certain facts which it thought supported the contention.

Would the Christian Scientists go round to the Masons and say, "This is anti-Masonic; it is really you they are attacking; you ought to do something about it"? Would they go round to the Knights of Columbus and say, "Now, they are attacking Christian Science, but if they get away with it, the next on the list will be the Catholic Church; if you wish to preserve the freedom of your faith you must combat this attack against us"? Would they go round to the more strenuous anti-Catholics and say, "Now, this is really a recrudescence of papal persecution, and if you do not attack it at once you may prepare for a revival of the worst excesses of religious fanaticism"? Would they go to the Negroes and say, "This attack on Christian Science is really a clever device of the White Man to retain the supremacy of his race and to more deeply subjugate the Black Man; you ought to resist it strongly"?

Would the Christian Scientists be capable of doing such things under the pretext of meeting an attack made upon them?

Hardly. They would take the statements one by one and set the facts, as they saw them, in order. They would take each separate charge, and where there was truth they would admit it, and where there was error, would bring facts to show the error. They would meet such matters as the non-Jew always meets them, squarely.

The Jews in the United States have not done that, more's the pity.

It is not, however, to be supposed that even this attempt to have others do their defense work for them is without its purpose. Don't you see how it splits up so-called "Gentile society"? There is the labor and capital split, for one—an artificial division. Then there is the religious split—or rather the irreligious one, for it is usually those who have least religion who fight most over it; that also is artificial, and never exists anywhere except as part of political ambition or suspected political ambition. Then there is the racial split, as between the white people and the colored ones, a split which has been rapidly widening of recent years, especially since the wealthy American international Jews, whose money financed the break-up of Russia, began also to take an interest in Negro welfare work.

By playing upon these splits the Jewish powers attain the precise condition described in the Protocols:

> *"To obtain control over public opinion it is first necessary to confuse it* by the expression from various sides of *so many conflicting opinions* that the Gentiles will lose themselves in the labyrinth . . . . This is the first secret.
>
> "The second secret consists in so increasing and intensifying the shortcomings of the people in their habits, passions and modes of living that no one will be able to collect himself in the chaos, and, consequently, people will lose all their mutual understanding."—Fifth Protocol.

Hear also the plan as stated in Protocol 10:

> *"To wear everyone out by dissensions, animosities, feuds.* . . . until the Gentiles see no other way of escape except an appeal to our money and power."

And as to the work described throughout this article, read Protocol 9:

> *"People of all opinions and of all doctrines are at our service,* restorers of monarchy, demagogues, Socialists, communists and other Utopians. We have put them all to work. Every one of them from his point of view is undermining the last remnant of authority . . . ."

To this might be added many others who can be identified by their actions.

But the aim of it all is stated in the Fifth Protocol:

> "A world coalition of Gentiles could cope with us temporarily, but we are assured against this by roots of dissension among them so deep that they cannot be torn out. *We have created antagonisms between the personal and national interests of the Gentiles by arousing RELIGIOUS and RACE hatreds* which we have nourished in their hearts for twenty centuries."

Even in the bankruptcy of Judah's power to answer the question that has been put to her, the same program is being followed: "Divide the people!"

The Jews say the Protocols were written by a madman. Mr. Spargo seems to think they were written by the Russian Secret Police. Of that, more later.

But strange to say, in the United States, in this year 1921, they are being fulfilled by Jews.

A book containing 236 pages of the first twenty articles on *The International Jew* will be sent to any address, upon receipt of 25 cents in stamps to cover printing and mailing cost.

Jewish World Notes

How Poland, with Christian charity, received the Jews when all other countries expelled them, and how the Jews repaid that charity by undermining their hosts until presently there was no more Poland, is the story told in "A World Problem," by Mrs. Stephanie Laudyn.

Mrs. Laudyn writes from an intimate knowledge of all the conditions discussed in her book. She knows her Russia and her Poland. If sometimes she writes with a little emotion, it is because she has come to close grips with influences which are as yet fairly well concealed in the United States; and a part of her emphasis may be attributed to her desire that the United States become alert before the same influences get an upper hand here.

It is an important work which Mrs. Laudyn has performed, not only for the good name of Poland, but also for the enlightenment of Americans. She has a keen sense of the importance of facts, and she brings an array of evidence which is not only convincing but commanding.

Mrs. Laudyn had much trouble in getting her book published. In spite of the welter of mediocre works which is constantly pouring from the presses, this book was not acceptable to any publisher to whom it was offered. Jewish propaganda is now appearing with the imprint of the oldest and most dignified American publishing houses, but the truth about the Jewish Question is made an outlaw thing by the attitude of those who control the printing press. The attitude is that the pro-Semite can deal in nothing but truth and calmness, and that everybody else deals in lies and prejudice. This is, of course, a passing phase. The Jews are rapidly using up their power by revealing it. A reaction will come. In the meantime, one who purchased at great cost the right to say her say before that right was acknowledged, is Mrs. Stephanie Laudyn.

The book is of 365 pages and is printed in English. It is essential to anyone wishing a world-view of the Jewish Problem. The book is sold at $2.25 a copy and may be procured from the author, 1145 Noble street, Chicago, Illinois.

The Jewish Socialist parties in Warsaw are negotiating a consolidation of the Bund, the Poalei-Zion and the United Party. In a proposed common platform, these parties are to unite on the following demands: 1—A campaign for Jewish autonomy (the state within the state); 2—Legal recognition of the Yiddish jargon; 3—Support for the co-operative movement and for immigration and colonization.

The Chicago *Israelite* complains that a perusal of the leading morning paper of that city discloses the fact that almost every other ad contains the slogan "gentiles only" (the small g is the *Israelite's*). This we are told "gives the lie" to the poem of Emma Lazarus inclosed in the pedestal of the Statue of Liberty in New York Harbor in which occurs the line: "Send these, the homeless, tempest tossed to me," and to the American principle of liberty for "huddled masses yearning to breathe free."

The "Society" chronicler of a Jewish weekly writes that naval honors were ordered by the admiralty for John W. Davis, the retiring American ambassador at London, on his departure from the shores of England. Furthermore, notables gathered at the station to bid him goodby and "Mrs. Davis shook hands with all except Lord Reading—whom she kissed." It will be remembered that Mr. Davis was at one time actively discussed as a probable Democratic candidate for the presidency last year.

According to a Philadelphia news dispatch, James A. Flaherty, Supreme Knight of the Knights of Columbus which did such good work in the war to make the world safe for democracy, in a recent address there denounced "an alleged anti-Jewish movement in certain southern states" and announced that he had "called upon the 2,200 Knights of Columbus lecturers in the United States and Canada to combat anti-Semitism."

The London *Jewish Chronicle* complains that the annual meeting of the Jewish Colonization Association was held behind closed doors, and none of the reports given to the public. The J. C. A. is the trustee of an enormous fund left by Baron de Hirsch, probably not far from $50,000,000. Baron de Hirsch, also, left $5,000,000 to American trustees for promoting agriculture and colonization among the Jews. The American trustees are as secretive as their English confreres and probably for the same reasons.

By a vote of 6 to 4 a committee of the New York legislature decided not to report out the Jewish Sabbath bill this year. The reason, presumably, is that the New York non-Jewish public has been awakened to what is going on.

"Give us a Jewish leader," cries the *Jewish Times*, which goes on to plead: "Give us a Jew big enough and able enough and spiritual enough to bring some semblance of order out of the chaotic conditions in which American Israel finds itself . . . . Who is there? Louis Marshall has tried to meet the situation and while he has done well he is not the man." This Jewish paper is not alone in appreciation of the deplorable exhibition of lack of character and ability displayed in the hysterically strenuous campaign of Israel's pseudo-leaders in this country to meet the situation created by the discussion of the Jewish problem so long evaded by our newspapers.

Can the City-Bred Man Succeed on the Farm?

By AARON HARDY ULM

This is the last of a series of six articles by Mr. Ulm on farm life and farm management.

"WHAT chance has the city man without farming experience of making a success as a practical operating farmer?" That question was put recently to leading specialists in the United States Department of Agriculture. No one of them was inclined to give an unqualified answer, but after all their provisos and ifs were assimilated with the facts so far as known, the answer invariably was, "very little."

"Does the city man of no experience always fail when he turns farmer?" they were asked.

"Not at all," was the reply. "Many of the most successful farmers in America didn't know what a furrow was until they were adults."

"Then the inexperienced man is not excluded from farming as a paying occupation?"

"Of course not, but students of the subject hesitate to advise inexperienced persons to go in for farm operation; that is, if they must earn a living from their efforts."

The United States Department of Agriculture doesn't advise the novice against taking up agricultural pursuits; on that question, as far as the writer could find, the departmental policy is a non-committal one; certainly so unless the beginner wants to start at the bottom of the agricultural ladder and "work up."

If the city man wants to turn farmer, the department will do all it can to provide him with needed help and advice on how to farm. It is significant, however, that virtually no literature of the department bears directly upon the needs of the inexperienced beginner in farming. The reason is that there is very little demand for such literature. Thousands of city people yearn for the open life of the country, but comparatively few, the facts indicate, yield to it. Of course there is always a margin of population that shifts more or less from city to country and vice versa. It, however, is primarily an agricultural population, consisting in the main of people reared in the country and familiar more or less with the business of planting and harvesting.

Many city occupations can be assumed on short or no apprenticeship by the man, woman or boy who leaves the farm. There is always a chance that they will go back to the country. Often the period of city life is helpful to them as farm people. They learn order and system and frequently save money that enables them to jump many years of humble and hard effort in getting established as operating farmers. If they remain in town and raise their children there, the second generation is apt to become fixed and indelibly urban.

Hence the division of population between rural and urban is affected by a confusing basal condition. A certain percentage of country-reared people will always be more or less unfitted for farming; that is, they can be of more use to themselves and to their time by following urban occupations. The transition from the rural to the urban is relatively easy. That is, the farm-reared boy, for example, who doesn't possess an affinity for the soil can go to town and, if employment conditions be good, become a street car conductor in a week or two, or a shipping clerk, or a minor retail salesman, or a workman, with opportunities for advancement as he learns and develops. But the city-reared boy who has affinity for the soil and might render his best service as a farmer, faces no such easy process of change. If he goes to the country and rents or buys a farm and tries to operate it the chances are that he will fail, no matter how hard he works. Hence economic forces that bear on the division of population do not operate with equal vigor between country and city. And as farming becomes more complex, the differential against the country increases. Some day this condition may present a serious problem.

In fact, "back to the land" and "forward to the land" movements are not participated in by the United States Department of Agriculture. Its energies in that respect are aimed chiefly at keeping the farm population on the farms, by making farming and rural life satisfactory, rather than at getting non-farmers to quit the towns and cities for the country. Officials of the department hold that economic laws will and should be permitted to control the division of population between rural and urban.

City boys learning the joys of growing things. Some will want to become practical farmers. How may they negotiate the transition which is by no means an easy one?

While the odds are against the average city man who would turn to farming as a living occupation, the non-farmer is by no means excluded from agriculture as a profitable pursuit. If he goes about making the change in the right way, he has good chances of success. The chief trouble, say the specialists, is that the city man is not much inclined to go about it in the right way. He is partial to the idea that he can show farmers how to farm by applying city methods to farm pursuits. Dr. Warren, of the Cornell School of Agriculture, has written that he knows of no case of a farm operated by a wealthy city man on the principle of "showing farmers how to farm" that is a financial success. This is the case, he says, even with those wonderfully equipped farms that are managed on salary by first-class agricultural college graduates, who frequently when farming for themselves achieve big success. The "country estates" conducted by wealthy city men render many good services to farming by promoting the growing of pure-bred cattle or horses or chickens or by introducing better plant life or superior cultivation. But in the item of management they contribute nothing of worth; for no management that doesn't make farming pay makes contribution to the advancement of agriculture.

Another mistake the city man makes, say the students, is in thinking that it is easier to be a specialty farmer than an all-round farmer.

"Because you can make a success of a dozen fowl kept in a city backyard doesn't mean that you can succeed with a flock of 500 fowl on a poultry farm," is the way one specialist put it. "You will find that the troubles you have with a dozen hens will grow much out of proportion to the number of hens added to your flock."

Of course there are many successful poultry farms and other specialty farms, and some are conducted by men who were not practical farmers at the start; but the odds, they say, are very much stronger against the novice that attempts poultry raising or like farming as against general farming.

How is the city-raised novice with a burning desire to add to the farming population to begin, if he begins at all?

There are two ways. One is to make a scientific study of agriculture, preferably in a college of agriculture, and the other is to serve an apprenticeship in practical farming.

The writer was surprised when he learned that a large proportion of students enrolled in many of the state agricultural colleges are from cities and without any practical farming experience. And a man who used to teach in one of the leading agricultural colleges says that the city-bred agricultural students get along about as well and are as successful, after graduation, in practical farming as the country-bred boys. *The development of agricultural education may serve to clear up that differential apparent in economic law against the flow of population, on necessity, from city to country. For the agricultural schools offer a way for the successful migration of the best type of city boys who would take up agriculture as a profession.*

The apprenticeship process of changing from city life to farming is much less attractive than the school method, but the authorities say that *apprenticeship in farming is much more essential to success than in the run of city trades and professions.*

This is because farming is no longer, if it ever was, a simple business. It is doubtful if any other pursuit involves so many complexities, so many different kinds of ability and talent, and such abrupt changings from one to the other.

But for those with the hardihood to learn farming from the ground up, agriculture offers many opportunities for material success and esthetic satisfaction.

"It is singular how the idea always crops up that the first step in farming is to own a farm," says E. T. Meredith, former Secretary of Agriculture. "'A farm of your own' is all right as a goal to look forward to, but the man who lacks either the requisite money or experience will reach the goal quicker by starting in as hired hand. If he has money even and no experience he will not find it profitable to acquire and operate a farm until he has gained that skill and judgment which will enable him to manage a farm successfully. The cheapest and quickest way to gain this skill and knowledge is by working on a well-managed farm in the summer and attending the winter short course at the nearest agricultural college.

"The young man without money will find working for wages on the farm the means for saving a little money and establishing his reputation as a skilled workman and a man of integrity. With a good reputation in these regards but little money is required to start as a tenant farmer, where he can realize on the extra energy, the better skill, and the good management he is able to put into his farming business.

"The road is open to the 'farm of your own,' and the road is neither longer nor harder for one who likes farming than is the road to success in other occupations, but the safest way is to start in at the bottom and climb the 'agricultural ladder.'

"The custom in many parts of the country, and among many progressive farmers, is to take the hired man into the family, while in industries the worker may never even see his employer and have no human contact with the man for whom he works," says former Secretary Meredith. "In the country we still have in considerable measure the old-time relations between employer and worker. The American farming regions form the great reservoirs of traditional American democracy. In the right sort of farming community and the right sort of farmer's household the hired man is received on his merits as a man. The individual human being seems to count for more out on the farm than he does in the city where great numbers of them are crowded together. If the hired man makes good, he will have no reason to complain of his social status."

Comparatively few farmers step into proprietorship through inheriting establishments developed for them by others. In three townships of Sedgwick County, Kansas, only 5.9 per cent of the farmers inherited the establishments they were operating; 13.7 per cent had procured their places via the homestead act; 80.4 per cent purchased the farms they were operating. Three-fourths of the purchases had been made by deferred payments, the other fourth with cash, usually procured from the sale of other farms.

It has been found that approximately 76 per cent of all operating farmers under 25 years old are tenants; which shows that the majority of every generation of American farmers is composed of men who build up from the bottom. The rate of tenancy declines rapidly with the growing age of farmers, until in the case of farmers 60 years old or beyond, it amounts to only 15 per cent. *No other industry will show such a rate of advance from worker to proprietor and owner.*

There are virtually no more arable lands open for acquirement by homestead. And farming lands have so increased in value that those in good farming sections are considered cheap when purchasable at $100 an acre. It is not unusual for farm lands in the rich Middle West to sell at from $400 to $500 an acre. Eighty per cent of sales made during the "land boom" in Iowa last year and the year before were at from $150 to $200 an acre, and it is estimated that the average Iowa farm now represents a capital investment of around $80,000. Of course it is not all in land, for farm implements and machinery now require big investments for farms where the best labor-saving devices can be used.

When one finds that the average value of farm land and improvements increased for the United States as a whole in a little more than a year, during 1919 and 1920, in the amount of $17.35 an acre, one cannot avoid the impression that farm land is becoming a scarce article in these United States.

Investigators estimate that the arable land for farming in this country may yet be increased approximately 50 per cent. That is to say, one-half as much land as is now included in farms may be made suitable for farming. Most of it calls for big expenditures for clearing, irrigation or drainage. Much of it, like the cut-over lands of the South and the Northwest, may be purchased very cheaply, and is excellent land when put into shape for cultivation.

Excepting those highly developed or "boom" agricultural districts, and the tremendous advance in the value of nearly all worth-while land during the last several years, farms may still be purchased at prices that are not exorbitant when compared with the cost of going into a good business in the city. *In fact, the cost of a medium-grade city home isn't much above the value of the average farm establishment, which is both home and business plant for its owner.*

Won World Trade —Can We Hold It?

By GEORGE F. KEARNEY

WE HAVE now reached the dramatic moment in the game of world finance. Over in one corner sits Uncle Sam, the novice, with his $8,000,000,000 winnings for the fiscal year of 1920. In his pocket he holds the I O U's of his former Allies for $9,450,550,005.61 which represents the indebtedness to the United States Government. In addition, there is an investment of private American capital in Europe to the extent of $3,500,000,000. In the circle sits a motley group of weary Europeans who are now combining to break the winning streak of the newcomer in the game of world trade. On the next few moves will depend America's mastery of Europe. Can we hold it? Our first duty is to analyze the figures of the foreign trade of the United States for 1920, and consider their breadth—the value in the light of the future.

In gauging the increase of foreign trade the real criterion, in these days of inflated valuation, resulting from higher prices, is not the money transactions involved, but the quantity of merchandise imported or exported. There are many articles in which there has been a marked decrease in the quantity, but, at the same time, an increase in stated value, while in still others a like quantity imported or exported in 1920 shows values two or three times as great in the fiscal year, 1914, the last normal year of our trade.

For example, the quantity of raw cotton exported in 1920 was twenty-five per cent below that of 1914, yet the stated value was actually one hundred and twenty-five per cent greater than that of the larger quantity exported in 1914. If the 1920 exports of cotton were sold at the 1914 prices it would have brought only one-third as much as the recorded valuation in the 1920 official figures. The three and one-half billion pounds of cotton exported from the United States in 1920 were actually valued at one hundred and twenty-five per cent more than the four and a half billion pounds exported in 1914.

O. P. Austin, the statistician for the National City Bank of New York, said, in commenting on the fictitious aspect of our foreign trade prosperity, "A close analysis of our export trade in 1920 indicates that the percentage of gain is but little greater than the percentage of increase in quantity in the like period immediately preceding the war. The increase in quantity of merchandise exported in the six-year period, 1914-1920, was as nearly as can be determined approximately thirty-five per cent, while the increase in quantity exported in the six-year period, 1908-1914, approximated twenty-five per cent."
